***Phil*. In answer to that, I say, first, created beings might begin to exist in the mind of other created intelligences, beside men. You will not therefore be able to prove any contradiction between Moses and my notions, unless you first shew there was no other order of finite created spirits in being, before man. I say farther, in case we conceive the creation, as we should at this time, a parcel of plants or vegetables of all sorts produced, by an invisible Power, in a desert where nobody was present -- that this way of explaining or conceiving it is consistent with my principles, since they**

deprive you of nothing, either sensible or imaginable; that it exactly suits with the common, natural, and undebauched notions of mankind; that it manifests the dependence of all things on God; and consequently hath all the good effect or influence, which it is possible that important article of our faith should have in making men humble, thankful, and resigned to their [great][11] Creator. I say, moreover, that, in this naked {253} conception of things, divested of words, there will not be found any notion of what you call the *actuality of absolute existence*. You may indeed raise a dust with those terms, and so lengthen our dispute to no purpose. But I entreat you calmly to look into your own thoughts, and then tell me if they are not a useless and unintelligible jargon.

***Hyl*. I own I have no very clear notion annexed to them. But what say you to this? Do you not make the existence of sensible things consist in their being in a mind? And were not all things eternally in the mind of God? Did they not therefore exist from all eternity, according to you? And how could that which was eternal be created in time? Can anything be clearer or better connected than this?**

***Phil*. And are not you too of opinion, that God knew all things from eternity?**

***Hyl*. I am.**

***Phil*. Consequently they always had a being in the Divine intellect.**

***Hyl*. This I acknowledge.**

***Phil*. By your own confession, therefore, nothing is new, or begins to be, in respect of the mind of God. So we are agreed in that point.**

***Hyl*. What shall we make then of the creation?**

***Phil*. May we not understand it to have been entirely in respect of finite spirits; so that things, with regard to us, may properly be said to begin their existence, or be created, when God decreed they should become perceptible to intelligent creatures, in that order and manner which He then established, and we now call the laws of nature? You may call this a *relative, or hypothetical existence* if you please. But, so long as it supplies us with the most natural, obvious, and literal sense of the Mosaic history of the creation; so long as it answers all the religious ends of that great article; in a word, so long as you can assign no other sense or meaning in its stead; why should we reject this? Is it to comply with a ridiculous sceptical humour of making everything nonsense and unintelligible? I am sure you cannot say it is for the glory of God. For, allowing it to be a thing possible and conceivable that the corporeal world should have an absolute existence extrinsical to the mind of God, as well as to the minds of all created spirits; yet how could this set forth either the immensity or omniscience of the Deity, or the necessary and immediate dependence of all {254} things on Him? Nay, would it not rather seem to derogate from those attributes?**

***Hyl*. Well, but as to this decree of God's, for making things perceptible, what say you, Philonous? Is it not plain, God did either execute that decree from all eternity, or at some certain time began to will what He had not actually willed before, but only designed to will? If the former, then there could be no creation, or beginning of existence, in finite things. If the latter, then we must acknowledge something new to befall the Deity; which implies a sort of change: and all change argues imperfection.**

***Phil*. Pray consider what you are doing. Is it not evident this objection concludes equally against a creation in any sense; nay, against every other act of the Deity, discoverable by the light of nature? None of which can *we* conceive, otherwise than as performed in time, and having a beginning. God is a Being of transceridert and unlimited perfections: His nature, therefore, is incomprehensible to finite spirits. It is not, therefore, to be expected, that any man, whether Materialist or**

Immaterialist, should have exactly just notions of the Deity, His attributes, and ways of operation. If then you would infer anything against me, your difficulty must not be drawn from the inadequateness of our conceptions of the Divine nature, which is unavoidable on any scheme; but from the denial of Matter, of which there is not one word, directly or indirectly, in what you have now objected.

***Hyl*. I must acknowledge the difficulties you are concerned to clear are such only as arise from the non-existence of Matter, and are peculiar to that notion. So far you are in the right. But I cannot by any means bring myself to think there is no such peculiar repugnancy between the creation and your opinion; though indeed where to fix it, I do not distinctly know.**

***Phil*. What would you have? Do I not acknowledge a twofold state of things -- the one ectypal or natural, the other archetypal and eternal? The former was created in time; the latter existed from everlasting in the mind of God. Is not this agreeable to the common notions of divines? or, is any more than this necessary in order to conceive the creation? But you suspect some peculiar repugnancy, though you know not where it lies. To take away all possibility of scruple in the case, do but consider this one point. Either you are not able to conceive {255} the Creation on any hypothesis whatsoever; and, if so, there is no ground for dislike or complaint against any particular opinion on that score: or you are able to conceive it; and, if so, why not on my Principles, since thereby nothing conceivable is taken away? You have all along been allowed the full scope of sense, imagination, and reason. Whatever, therefore, you could before apprehend, either immediately or mediately by your senses, or by ratiocination from your senses; whatever you could perceive, imagine, or understand, remains still with you. If, therefore, the notion you have of the creation by other Principles be intelligible, you have it still upon mine; if it be not intelligible, I conceive it to be no notion at all; and so there is no loss of it. And indeed it seems to me very plain that the supposition of Matter, that is a thing perfectly unknown and inconceivable, cannot serve to make us conceive anything. And, I hope it need not be proved to you that if the existence of Matter doth not make the creation conceivable, the creation's being without it inconceivable can be no objection against its non-existence.**

***Hyl*. I confess, Philonous, you have almost satisfied me in this point of the creation.**

***Phil*. I would fain know why you are not quite satisfied. You tell me indeed of a repugnancy between the Mosaic history and Immaterialism: but you know not where it lies. Is this reasonable, Hylas? Can you expect I should solve a difficulty without knowing what it is? But, to pass by all that, would not a man think you were assured there is no repugnancy between the received notions of Materialists and the inspired writings?**

***Hyl*. And so I am.**

***Phil*. Ought the historical part of Scripture to be understood in a plain obvious sense, or in a sense which is metaphysical and out of the way?**

***Hyl*. In the plain sense, doubtless.**

***Phil*. When Moses speaks of herbs, earth, water, &c. as having been created by God; think you not the sensible things commonly signified by those words are suggested to every unphilosophical reader?**

***Hyl*. I cannot help thinking so.**

***Phil*. And are not all ideas, or things perceived by sense, to be denied a real existence by the doctrine of the Materialist?**

***Hyl*. This I have already acknowledged.**

***Phil*. The creation, therefore, according to them, was not {256} the creation of things sensible, which have only a relative being, but of certain unknown natures, which have an absolute being, wherein creation might terminate?**

***Hyl*. True.**

***Phil*. Is it not therefore evident the assertors of Matter destroy the plain obvious sense of Moses, with which their notions are utterly inconsistent; and instead of it obtrude on us I know not what; something equally unintelligible to themselves and me?**

***Hyl*. I cannot contradict you.**

***Phil*. Moses tells us of a creation. A creation of what? of unknown quiddities, of occasions, or *substratum*? No, certainly; but of things obvious to the senses. You must first reconcile this with your notions, if you expect I should be reconciled to them.**

***Hyl*. I see you can assault me with my own weapons.**

***Phil*. Then as to *absolute existence*; was there ever known a more jejune notion than that? Something it is so abstracted and unintelligible that you have frankly owned you could not conceive it, much less explain anything by it. But allowing Matter to exist, and the notion of absolute existence to be clear as light; yet, was this ever known to make the creation more credible? Nay, hath it not furnished the atheists and infidels of all ages with the most plausible arguments against a creation? That a corporeal substance, which hath an absolute existence without the minds of spirits, should be produced out of nothing, by the mere will of a Spirit, hath been looked upon as a thing so contrary to all reason, so impossible and absurd! that not only the most celebrated among the ancients, but even divers modern and Christian philosophers have thought Matter co-eternal with the Deity. Lay these things together, and then judge you whether Materialism disposes men to believe the creation of things.**

***Hyl*. I own, Philonous, I think it does not. This of the *creation* is the last objection I can think of; and I must needs own it hath been sufficiently answered as well as the rest. Nothing now remains to be overcome but a sort of unaccountable backwardness that I find in myself towards your notions.**

***Phil*. When a man is swayed, he knows not why, to one side of' the question, can this, think you, be anything else but the effect of prejudice, which never fails to attend old and rooted {257} notions? And indeed in this respect I cannot deny the belief of Matter to have very much the advantage over the contrary opinion, with men of a learned, education.**

***Hyl*. I confess it seems to be as you say.**

***Phil*. As a balance, therefore, to this weight of prejudice, let us throw into the scale the great advantages that arise from the belief of Immaterialism, both in regard to religion and human learning. The being of a God, and incorruptibility of the soul, those great articles of religion, are they not proved with the clearest and most immediate evidence? When I say the being of a God, I do not mean an obscure general Cause of things, whereof we have no conception, but God, in the strict and proper sense of the word. A Being whose spirituality, omnipresence, providence, omniscience, infinite power and goodness, are as conspicuous as the existence of sensible things, of which (notwithstanding the fallacious pretences and affected scruples of Sceptics) there is no more reason to doubt than of our own being. -- Then, with relation to human sciences. In Natural Philosophy, what intricacies, what obscurities, what contradictions hath the belief of Matter led**

men into! To say nothing of the numberless disputes about its extent, continuity, homogeneity, gravity, divisibility, &c. -- do they not pretend to explain all things by bodies operating on bodies, according to the laws of motion? and yet, are they able to comprehend how one body should move another? Nay, admitting there was no difficulty in reconciling the notion of an inert being with a cause, or in conceiving how an accident might pass from one body to another; yet, by all their strained thoughts and extravagant suppositions, have they been able to reach the *mechanical* production of any one animal or vegetable body? Can they account, by the laws of motion, for sounds, tastes, smells, or colours; or for the regular course of things? Have they accounted, by physical principles, for the aptitude and contrivance even of the most inconsiderable parts of the universe? But, laying aside Matter and corporeal, causes, and admitting only the efficiency of an All-perfect Mind, are not all the effects of nature easy and intelligible? If the *phenomena* are nothing else but *ideas*; God is a *spirit*, but Matter an unintelligent, unperceiving being. If they demonstrate an unlimited power in their cause; God is active and omnipotent, but Matter an inert mass. If the order, regularity, and usefulness of them can {258} never be sufficiently admired; God is infinitely wise and provident, but Matter destitute of all contrivance and design. These surely are great advantages in *Physics*. Not to mention that the apprehension of a distant Deity naturally disposes men to a negligence in their moral actions; which they would be more cautious of, in case they thought Him immediately present, and acting on their minds, without the interposition of Matter, or unthinking second causes. -- Then in *Metaphysics*: what difficulties concerning entity in abstract, substantial forms, hylarchic principles, plastic natures, substance and accident, principle of individuation, possibility of Matter's thinking, origin of ideas, the manner how two independent substances so widely different as *Spirit and Matter*, should mutually operate on each other? what difficulties, I say, and endless disquisitions, concerning these and innumerable other the like points, do we escape, by supposing only Spirits and ideas? -- Even the *Mathematics* themselves, if we take away the absolute existence of extended things, become much more clear and easy; the most shocking paradoxes and intricate speculations in those sciences depending on the. infinite divisibility of finite extension; which depends on that supposition -- But what need is there to insist on the particular sciences? Is not that opposition to all science whatsoever, that frenzy of the ancient and modern Sceptics, built on the same foundation? Or can you produce so much as one argument against the reality of corporeal things, or in behalf of that avowed utter ignorance of their natures, which doth not suppose their reality to consist in an external absolute existence? Upon this supposition, indeed, the objections from the change of colours in a pigeon's neck, or the appearance of the broken oar in the water, must be allowed to have weight. But these and the like objections vanish, if we do not maintain the being of absolute external originals, but place the reality of things in ideas,. fleeting indeed, and changeable; -- however, not changed at random, but according to the fixed order of nature. For, herein consists that constancy and truth of things which secures all the concerns of life, and distinguishes that which is real from the *irregular visions of* the fancy. {259}

***Hyl*. I agree to all you have now said., and must own that nothing can incline me to embrace your opinion more than the advantages I see it is attended with. I am by nature lazy; and this would be a mighty abridgment in knowledge. What doubts, what hypotheses, what labyrinths of amusement, what fields of disputation, what an ocean of false learning, may be avoided by that single notion of *Immaterialism*!**

***Phil*. After all, is there anything farther remaining to be done? You may remember you promised to embrace that opinion which upon examination should appear most agreeable to Common Sense**

and remote from Scepticism. This, by your own confession, is that which denies Matter, or the *absolute* existence of corporeal things. Nor is this all; the same notion has been proved several ways, viewed in different lights, pursued in its consequences, and all objections against it cleared. Can there be a greater evidence of its truth? or is it possible it should have all the marks of a true opinion and yet be false?

***Hyl*. I own myself entirely satisfied for the present in all respects. But, what security can I have that I shall still continue the same full assent to your opinion, and that no unthought-of objection or difficulty will occur hereafter?**

***Phil*. Pray, Hylas, do you in other cases, when a point is once evidently proved, withhold your consent on account of objections or difficulties it may be liable to? Are the difficulties that attend the doctrine of incommensurable quantities, of the angle of contact, of the asymptotes to curves, or the like, sufficient to make you hold out against mathematical demonstration? Or will you disbelieve the Providence of God, because there may be some particular things which you know not how to reconcile with it? If there are difficulties *attending Immaterialism*, there are at the same time direct and evident proofs of it. But for the existence of Matter there is not one proof, and far more numerous and insurmountable objections lie against it. But where are those mighty difficulties you insist on? Alas! you know not where or what they are; something which may possibly occur hereafter. If this be a sufficient pretence for withholding your full assent, you should never yield it to any proposition, how free soever from exceptions, how clearly and solidly soever demonstrated.**

***Hyl*. You have satisfied me, Philonous.**

***Phil*. But, to arm you against all future objections, do but consider: That which bears equally hard on two contradictory {260} opinions can be proof against neither. Whenever, therefore, any difficulty occurs, try if you can find a solution for it on the hypothesis of the *Materialists*. Be not deceived by words; but sound your own thoughts. And in case you cannot conceive it easier by the help of *Materialism*, it is plain it can be no objection against *Immaterialism*. Had you proceeded all along by this rule, you would probably have spared yourself abundance of trouble in objecting; since of all your difficulties I challenge you to shew one that is explained by Matter: nay, which is not more unintelligible with than without that supposition; and consequently makes rather *against than* for it. You should consider, in each particular, whether the difficulty arises from the *non-existence of Matter*. If it doth not, you might as well argue from the infinite divisibility of extension against the Divine prescience, as from such a difficulty against *Immaterialism*. And yet, upon recollection, I believe you will find this to have been often, if not always, the case. You should likewise take heed not to argue on a *petitio principii*. One is apt to say -- The unknown substances ought to be esteemed real things, rather than the ideas in our minds: and who can tell but the unthinking external substance may concur, as a cause or instrument, in the productions of our ideas? But is not this proceeding on a supposition that there are such external substances? And to suppose this, is it not begging the question? But, above all things, you should beware of imposing on yourself by that vulgar sophism which is called *ignoratio elenchi*. You talked often as if you thought I maintained the non-existence of Sensible Things. Whereas in truth no one can be more thoroughly assured of their existence than I am. And it is you who doubt; I should have said, positively deny it. Everything that is seen, felt, heard, or any way perceived by the senses, is, on the principles I embrace, a real being; but not on yours. Remember, the Matter you contend for is an Unknown Somewhat (if indeed it may be termed *somewhat*), which is quite stripped of all sensible qualities, and can neither be perceived by sense, nor apprehended by the mind. Remember I say,**

that it is not any object which is hard or soft, hot or cold, blue or white, round or square, &c. For all these things I affirm do exist. Though indeed I deny they have an existence distinct from being perceived; or that they exist out of all minds whatsoever. Think on these points; let them be attentively considered and still kept in view. Otherwise you will not comprehend the state of the question; without which your objections {261} will always be wide of the mark, and, instead of mine, may possibly be directed (as more than once they have been) against your own notions.

***Hyl*. I must needs own, Philonous, nothing seems to have kept me from agreeing with you more than this same *mistaking the question*. In denying Matter,. at first, glimpse I am tempted to imagine you deny the things we see and feel: but, upon reflexion, find there is no ground for it. What think you, therefore, of retaining the name *Matter*, and applying it to *sensible things*? This may be done without any change in your sentiments: and, believe me, it would be a means of reconciling them to some persons who may be more shocked at an innovation in words than in opinion.**

***Phil*. With all my heart: retain the word *Matter*, and apply it to the objects of sense, if you please; provided you do not attribute to them any subsistence distinct from their being perceived. I shall never quarrel with you for an expression. *Matter*, or *material substance*, are terms introduced by philosophers; and, as used by them, imply a sort of independency, or a subsistence distinct from being perceived by a mind: but are never used by common people; or, if ever, it is to signify the immediate objects of sense. One would think, therefore, so long as the names of all particular things, with the *terms sensible*, *substance*, *body*, *stuff*, and the like, are retained, the word *Matter* should be never missed in common talk. And in philosophical discourses it seems the best way to leave it quite out: since there is not, perhaps, any one thing that hath more favoured and strengthened the depraved bent of the mind towards Atheism than the use of that general confused term.**

***Hyl*. Well but, Philonous, since I am content to give up the notion of an unthinking substance exterior to the mind, I think you ought not to deny me the privilege of using the word *Matter* as I please, and annexing it to a collection of sensible qualities subsisting only in the mind. I freely own there is no other substance, in a strict sense, than *Spirit*. But I have been so long accustomed to the *term Matter* that I know not how to part with it: to say, there is no *Matter* in the world, is still shocking to me. Whereas to say -- There is no *Matter*, if by that term be meant an unthinking substance existing without the mind; but if by *Matter* is meant some sensible thing, whose existence consists in being perceived, then there is *Matter*: -- *this* distinction gives it quite another turn; and men will come into your notions with {262} small difficulty, when they are proposed in that manner. For, after all, the controversy about *Matter* in the strict acceptation of it, lies altogether between you and the philosophers: whose principles, I acknowledge, are not near so natural, or so agreeable to the common sense of mankind, and Holy Scripture, as yours. There is nothing we either desire or shun but as it makes, or is apprehended to make, some part of our happiness or misery. But what hath happiness or misery, joy or grief, pleasure or pain, to do with Absolute Existence; or with unknown entities, *abstracted from dl relation to us*? It is evident, things regard us only as they are pleasing or displeasing: and they can please or displease only so far forth as they are perceived. Farther, therefore, we are not concerned; and thus far you leave things as you found them. Yet still there is something new in this doctrine. It is plain, I do not now think with the Philosophers; nor yet altogether with the vulgar. I would know how the case stands in that respect; precisely, what you have added to, or altered in my former notions.**

***Phil*. I do not pretend to be a setter-up of new notions. My endeavours tend only to unite, and place in a clearer light, that truth which was before shared between the vulgar and the philosophers: --**

the former being of opinion, that *those things they immediately perceive are the real things*; and the latter, that *the things immediately perceived are ideas, which exist only in the mind*. Which two notions put together, do, in effect, constitute the substance of what I advance.

***Hyl*. I have been a long time distrusting my senses: methought I saw things by a dim light and through false glasses. Now the glasses are removed and a new light breaks in upon my under standing. I am clearly convinced that I see things in their native forms, and am no longer in pain about their *unknown natures or absolute existence*. This is the state I find myself in at present; though, indeed, the course that brought me to it I do not yet thoroughly comprehend. You set out upon the same principles that Academics, Cartesians, and the like sects usually do; and for a long time it looked as if you were advancing their philosophical Scepticism: but, in the end, your conclusions are directly opposite to theirs.**

***Phil*. You see, Hylas, the water of yonder fountain, how it is forced upwards, in a round column, to a certain height; at {263} which it breaks, and falls back into the basin from whence it rose: its ascent, as well as descent, proceeding from the same uniform law or principle of gravitation. just so, the same Principles which, at first view, lead to Scepticism, pursued to a certain point, bring men back to Common Sense.**

THREE DIALOGUES
Between
HYLAS AND PHILONOUS

The Design of which is Plainly to Demonstrate the Reality and Perfection of

HUMAN KNOWLEDGE
The Incorporeal Nature of the

SOUL
And the Immediate Providence of a

DEITY
In Opposition to

SCEPTICS AND ATHEISTS

Also to Open a Method for Rendering the Sciences More Easy, Useful, and Compendious

{171}

THE FIRST DIALOGUE

<Philonous>. Good morrow, Hylas: I did not expect to find you abroad so early.

<Hylas>. It is indeed something unusual; but my thoughts were so taken up with a subject I was discoursing of last night, that finding I could not sleep, I resolved to rise and take a turn in the garden.

<Phil>. It happened well, to let you see what innocent and agreeable pleasures you lose every morning. Can there be a pleasanter time of the day, or a more delightful season of the year? That purple sky, those wild but sweet notes of birds, the fragrant bloom upon the trees and flowers, the gentle influence of the rising sun, these and a thousand nameless beauties of

nature inspire the soul with secret transports; its faculties too being at this time fresh and lively, are fit for those meditations, which the solitude of a garden and tranquillity of the morning naturally dispose us to. But I am afraid I interrupt your thoughts: for you seemed very intent on something.

<Hyl>. It is true, I was, and shall be obliged to you if you will permit me to go on in the same vein; not that I would by any means deprive myself of your company, for my thoughts always flow more easily in conversation with a friend, than when I am alone: but my request is, that you would suffer me to impart my reflexions to you.

<Phil>. With all my heart, it is what I should have requested myself if you had not prevented me.

<Hyl>. I was considering the odd fate of those men who have in all ages, through an affectation of being distinguished from the vulgar, or some unaccountable turn of thought, pretended either to believe nothing at all, or to believe the most extravagant things in the world. This however might be borne, if their paradoxes and scepticism did not draw after them some consequences of general disadvantage to mankind. But the mischief lieth {172} here; that when men of less leisure see them who are supposed to have spent their whole time in the pursuits of knowledge professing an entire ignorance of all things, or advancing such notions as are repugnant to plain and commonly received principles, they will be tempted to entertain suspicions concerning the most important truths, which they had hitherto held sacred and unquestionable.

<Phil>. I entirely agree with you, as to the ill tendency of the affected doubts of some philosophers, and fantastical conceits of others. I am even so far gone of late in this way of thinking, that I have quitted several of the sublime notions I had got in their schools for vulgar opinions. And I give it you on my word; since this revolt from metaphysical notions to the plain dictates of nature and common sense, I find my understanding strangely enlightened, so that I can now easily comprehend a great many things which before were all mystery and riddle.

<Hyl>. I am glad to find there was nothing in the accounts I heard of you.

<Phil>. Pray, what were those?

<Hyl>. You were represented, in last night's conversation, as one who maintained the most extravagant opinion that ever entered into the mind of man, to wit, that there is no such thing as <material substance> in the world.

<Phil>. That there is no such thing as what <philosophers call material substance>, I am seriously persuaded: but, if I were made to see anything absurd or sceptical in this, I should then have the same reason to renounce this that I imagine I have now to reject the contrary opinion.

<Hyl>. What I can anything be more fantastical, more repugnant to Common Sense, or a more manifest piece of Scepticism, than to believe there is no such thing as <matter>?

<Phil>. Softly, good Hylas. What if it should prove that you, who hold there is, are, by virtue of that opinion, a greater sceptic, and maintain more paradoxes and repugnances to Common Sense, than I who believe no such thing?

<Hyl>. You may as soon persuade me, the part is greater than the whole, as that, in order to avoid absurdity and Scepticism, I should ever be obliged to give up my opinion in this point.

<Phil>. Well then, are you content to admit that opinion for true, which upon examination shall appear most agreeable to Common Sense, and remote from Scepticism?

<Hyl>. With all my heart. Since you are for raising disputes {173} about the plainest things in nature, I am content for once to hear what you have to say.

<Phil>. Pray, Hylas, what do you mean by a <sceptic>?

<Hyl>. I mean what all men mean -- one that doubts of everything.

<Phil>. He then who entertains no doubts concerning some particular point, with regard to that point cannot be thought a sceptic.

<Hyl>. I agree with you.

<Phil>. Whether doth doubting consist in embracing the affirmative or negative side of a question?

<Hyl>. In neither; for whoever understands English cannot but know that <doubting> signifies a suspense between both.

<Phil>. He then that denies any point, can no more be said to doubt of it, than he who affirmeth it with the same degree of assurance.

<Hyl>. True.

<Phil>. And, consequently, for such his denial is no more to be esteemed a sceptic than the other.

<Hyl>. I acknowledge it.

<Phil>. How cometh it to pass then, Hylas, that you pronounce me <a sceptic>, because I deny what you affirm, to wit, the existence of Matter? Since, for aught you can tell, I am as peremptory in my denial, as you in your affirmation.

<Hyl>. Hold, Philonous, I have been a little out in my definition; but every false step a man makes in discourse is not to be insisted on. I said indeed that a <sceptic> was one who doubted of everything; but I should have added, or who denies the reality and truth of things.

<Phil>. What things? Do you mean the principles and theorems of sciences? But these you know are universal intellectual notions, and consequently independent of Matter. The denial therefore of this doth not imply the denying them.

<Hyl>. I grant it. But are there no other things? What think you of distrusting the senses, of denying the real existence of sensible things, or pretending to know nothing of them. Is not this sufficient to denominate a man a <sceptic>?

<Phil>. Shall we therefore examine which of us it is that denies the reality of sensible things, or professes the greatest ignorance of them; since, if I take you rightly, he is to be {174} esteemed the greatest <sceptic>?

<Hyl>. That is what I desire.

<Phil>. What mean you by Sensible Things?

<Hyl>. Those things which are perceived by the senses. Can you imagine that I mean anything else?

<Phil>. Pardon me, Hylas, if I am desirous clearly to apprehend your notions, since this may much shorten our inquiry. Suffer me then to ask you this farther question. Are those things only perceived by the senses which are perceived immediately? Or, may those things properly be said to be <sensible> which are perceived mediately, or not without the intervention of others?

<Hyl>. I do not sufficiently understand you.

<Phil>. In reading a book, what I immediately perceive are the letters; but mediately, or by means of these, are suggested to my mind the notions of God, virtue, truth, &c. Now, that the letters are truly sensible things, or perceived by sense, there is no doubt: but I would know whether you take the things suggested by them to be so too.

<Hyl>. No, certainly: it were absurd to think <God> or <virtue> sensible things; though they may be signified and suggested to the mind by sensible marks, with which they have an arbitrary connexion.

<Phil>. It seems then, that by <sensible things> you mean those only which can be perceived <immediately> by sense?

<Hyl>. Right.

<Phil>. Doth it not follow from this, that though I see one part of the sky red, and another blue, and that my reason doth thence evidently conclude there must be some cause of that diversity of colours, yet that cause cannot be said to be a sensible thing, or perceived by the sense of seeing?

<Hyl>. It doth.

<Phil>. In like manner, though I hear variety of sounds, yet I cannot be said to hear the causes of those sounds?

<Hyl>. You cannot.

<Phil>. And when by my touch I perceive a thing to be hot and heavy, I cannot say, with any truth or propriety, that I feel the cause of its heat or weight?

<Hyl>. To prevent any more questions of this kind, I tell you once for all, that by <sensible things> I mean those only which are perceived by sense; and that in truth the senses perceive nothing which they do not perceive <immediately>: for they make no {175} inferences. The deducing therefore of causes or occasions from effects and appearances, which alone are perceived by sense, entirely relates to reason.

<Phil>. This point then is agreed between us -- That <sensible things are those only which are immediately perceived by sense>. You will farther inform me, whether we immediately perceive by sight anything beside light, and colours, and figures; or by hearing, anything but sounds; by the palate, anything beside tastes; by the smell, beside odours; or by the touch, more than tangible qualities.

<Hyl>. We do not.

<Phil>. It seems, therefore, that if you take away all sensible qualities, there remains nothing sensible?

<Hyl>. I grant it.

<Phil>. Sensible things therefore are {250} nothing else but so many sensible qualities, or combinations of sensible qualities?

<Hyl>. Nothing else.

<Phil>. <Heat> then is a sensible thing?

<Hyl>. Certainly.

<Phil>. Doth the <reality> of sensible things consist in being perceived? or, is it something distinct from their being perceived, and that bears no relation to the mind?

<Hyl>. To <exist> is one thing, and to be <perceived> is another.

<Phil>. I speak with regard to sensible things only. And of these I ask, whether by their real existence you mean a subsistence exterior to the mind, and distinct from their being perceived?

<Hyl>. I mean a real absolute being, distinct from, and without any relation to, their being perceived.

<Phil>. Heat therefore, if it be allowed a real being, must exist without the mind?

<Hyl>. It must.

<Phil>. Tell me, Hylas, is this real existence equally compatible to all degrees of heat, which we perceive; or is there any reason why we should attribute it to some, and deny it to others? And if there be, pray let me know that reason.

<Hyl>. Whatever degree of heat we perceive by sense, we may be sure the same exists in the object that occasions it.

<Phil>. What! the greatest as well as the least?

<Hyl>. <I> tell you, the reason is plainly the same in respect of both. They are both perceived by sense; nay, the greater degree of heat is more sensibly perceived; and consequently, if there is {176} any difference, we are more certain of its real existence than we can be of the reality of a lesser degree.

<Phil>. But is not the most vehement and intense degree of heat a very great pain?

<Hyl>. No one can deny it.

<Phil>. And is any unperceiving thing capable of pain or pleasure?

<Hyl>. No, certainly.

<Phil>. Is your material substance a senseless being, or a being endowed with sense and perception?

<Hyl>. It is senseless without doubt.

<Phil>. It cannot therefore be the subject of pain?

<Hyl>. By no means.

<Phil>. Nor consequently of the greatest heat perceived by sense, since you acknowledge this to be no small pain?

<Hyl>. I grant it.

<Phil>. What shall we say then of your external object; is it a material Substance, or no?

<Hyl>. It is a material substance with the sensible qualities inhering in it.

<Phil>. How then can a great heat exist in it, since you own it cannot in a material substance? I desire you would clear this point.

<Hyl>. Hold, Philonous, I fear I was out in yielding intense heat to be a pain. It should seem rather, that pain is something distinct from heat, and the consequence or effect of it.

<Phil>. Upon putting your hand near the fire, do you perceive one simple uniform sensation, or two distinct sensations?

<Hyl>. But one simple sensation.

<Phil>. Is not the heat immediately perceived?,

<Hyl>. It is.

<Phil>. And the pain?

<Hyl>. True.

<Phil>. Seeing therefore they are both immediately perceived at the same time, and the fire affects you only with one simple or uncompounded idea, it follows that this same simple idea is both the intense heat immediately perceived, and the pain; and, consequently, that the intense heat immediately perceived is nothing distinct from a particular sort of pain.

<Hyl>. It seems so.

<Phil>. Again, try in your thoughts, Hylas, if you can conceive a vehement sensation to be without pain or pleasure.
{177}

<Hyl>. I cannot.

<Phil>. Or can you frame to yourself an idea of sensible pain or pleasure in general, abstracted from every particular idea of heat, cold, tastes, smells? &c.

<Hyl>. I do not find that I can.

<Phil>. Doth it not therefore follow, that sensible pain is nothing distinct from those sensations or ideas, in an intense degree?

<Hyl>. It is undeniable; and, to speak the truth, I begin to suspect a very great heat cannot exist but in a mind perceiving it.

<Phil>. What! are you then in that sceptical state of suspense, between affirming and denying?

<Hyl>. I think I may be positive in the point. A very violent and painful heat cannot exist without the mind.

<Phil>. It hath not therefore according to you, any <real> being?

<Hyl>. I own it.

<Phil>. Is it therefore certain, that there is no body in nature really hot?

<Hyl>. I have not denied there is any real heat in bodies. I only say, there is no such thing as an intense real heat.

<Phil>. But, did you not say before that all degrees of heat were equally real; or, if there was any difference, that the greater were more undoubtedly real than the lesser?

<Hyl>. True: but it was because I did not then consider the ground there is for distinguishing between them, which I now plainly see. And it is this: because intense heat is nothing else but a particular kind of painful sensation; and pain cannot exist but in a perceiving being; it follows that no intense heat can really exist in an unperceiving corporeal substance. But this is no reason wh' we should deny heat in an inferior degree to exist in such a substance.

<Phil>. But how shall we be able to discern those degrees of heat which exist only in the mind from those which exist without

it?

<Hyl>. That is no difficult matter. You know the least pain cannot exist unperceived; whatever, therefore, degree of heat is a pain exists only in the mind. But, as for all other degrees of heat, nothing obliges us to think the same of them.

<Phil>. I think you granted before that no unperceiving being was capable of pleasure, any more than of pain.

<Hyl>. I did. {178}

<Phil>. And is not warmth, or a more gentle degree of heat than what causes uneasiness, a pleasure?

<Hyl>. What then?

<Phil>. Consequently, it cannot exist without the mind in an unperceiving substance, or body.

<Hyl>. So it seems.

<Phil>. Since, therefore, as well those degrees of heat that are not painful, as those that are, can exist only in a thinking substance; may we not conclude that external bodies are absolutely incapable of any degree of heat whatsoever?

<Hyl>. On second thoughts, I do not think it so evident that warmth is a pleasure as that a great degree of heat is a pain.

<Phil>. <I> do not pretend that warmth is as great a pleasure as heat is a pain. But, if you grant it to be even a small pleasure, it serves to make good my conclusion.

<Hyl>. I could rather call it an <indolence>. It seems to be nothing more than a privation of both pain and pleasure. And that such a quality or state as this may agree to an unthinking substance, I hope you will not deny.

<Phil>. If you are resolved to maintain that warmth, or a gentle degree of heat, is no pleasure, I know not how to convince you otherwise than by appealing to your own sense. But what think you of cold?

<Hyl>. The same that I do of heat. An intense degree of cold is a pain; for to feel a very great cold, is to perceive a great uneasiness: it cannot therefore exist without the mind; but a lesser degree of cold may, as well as a lesser degree of heat.

<Phil>. Those bodies, therefore, upon whose application to our own, we perceive a moderate degree of heat, must be concluded to have a moderate degree of heat or warmth in them; and those, upon whose application we feel a like degree of cold, must be thought to have cold in them.

<Hyl>. They must.

<Phil>. Can any doctrine be true that necessarily leads a man into an absurdity?

<Hyl>. Without doubt it cannot.

<Phil>. Is it not an absurdity to think that the same thing should be at the same time both cold and warm?

<Hyl>. It is.

<Phil>. Suppose now one of your hands hot, and the other cold, and that they are both at once put into the same vessel of {179} water, in an intermediate state; will not the water seem cold to one hand, and warm to the other?

<Hyl>. It will.

<Phil>. Ought we not therefore, by your principles, to conclude it is really both cold and warm at the same time, that is, according to your own concession, to believe an absurdity?

<Hyl>. I confess it seems so.

<Phil>. Consequently, the principles themselves are false, since you have granted that no true principle leads to an absurdity.

<Hyl>. But, after all, can anything be more absurd than to say, <there is no heat in the fire>?

<Phil>. To make the point still clearer; tell me whether, in two cases exactly alike, we ought not to make the same judgment?

.<Hyl>. We ought.

<Phil>. When a pin pricks your finger, doth it not rend and divide the fibres of your flesh?

<Hyl>. It doth.

<Phil>. And when a coal burns your finger, doth it any more?

<Hyl>. It doth not.

<Phil>. Since, therefore, you neither judge the sensation itself occasioned by the pin, nor anything like it to be in the pin; you should not, conformably to what you have now granted, judge the sensation occasioned by the fire, or anything like it, to be in the fire.

<Hyl>. Well, since it must be so, I am content to yield this point, and acknowledge that heat and cold are only sensations existing in our minds. But there still remain qualities enough to secure the reality of external things.

<Phil>. But what will you say, Hylas, if it shall appear that the case is the same with regard to all other sensible qualities, and that they can no more be supposed to exist without the mind, than heat and cold?

<Hyl>. Then indeed you will have done something to the purpose; but that is what I despair of seeing proved.

<Phil>. Let us examine them in order. What think you of <tastes>, do they exist without the mind, or no?

<Hyl>. Can any man in his senses doubt whether sugar is sweet, or wormwood bitter?

<Phil>. Inform me, Hylas. Is a sweet taste a particular kind of pleasure or pleasant sensation, or is it not? {180}

<Hyl>. It is.

<Phil>. And is not bitterness some kind of uneasiness or pain?

<Hyl>. I grant it.

<Phil>. If therefore sugar and wormwood are unthinking corporeal substances existing without the mind, how can sweetness and bitterness, that is, Pleasure and pain, agree to them?

<Hyl>. Hold, Philonous, I now see what it was delude time. You asked whether heat and cold, sweetness at were not particular sorts of pleasure and pain; to which simply, that they were. Whereas I should have thus distinguished: those qualities, as perceived by us, are pleasures or pair existing in the external objects. We must not therefore conclude absolutely, that there is no heat in the fire, or sweetness in the sugar, but only that heat or sweetness, as perceived by us, are not in the fire or sugar. What say you to this?

<Phil>. I say it is nothing to the purpose. Our discourse proceeded altogether concerning sensible things, which you defined to be, <the things we immediately perceive by our senses>. Whatever other qualities, therefore, you speak of as distinct from these, I know nothing of them, neither do they at all belong to the point in dispute. You may, indeed, pretend to have discovered certain qualities which you do not perceive, and assert those insensible qualities exist in fire and sugar. But what use can be made of this to your present purpose, I am at a loss to conceive. Tell me then once more, do you acknowledge that heat and cold, sweetness and bitterness (meaning those qualities which are perceived by the senses), do not exist without the mind?

<Hyl>. I see it is to no purpose to hold out, so I give up the cause as to those mentioned qualities. Though I profess it sounds oddly, to say that sugar is not sweet.

<Phil>. But, for your farther satisfaction, take this along with you: that which at other times seems sweet, shall, to a distempered palate, appear bitter. And, nothing can be plainer than that divers persons perceive different tastes in the same food; since that which one man delights in, another abhors. And how could this be, if the taste was something really inherent in the food?

<Hyl>. I acknowledge I know not how.

<Phil>. In the next place, <odours> are to be considered. And, with regard to these, I would fain know whether what hath {181} been said of tastes doth not exactly agree to them? Are they not so many pleasing or displeasing sensations?

<Hyl>. They are.

<Phil>. Can you then conceive it possible that they should exist in an unperceiving thing?

<Hyl>. I cannot.

<Phil>. Or, can you imagine that filth and ordure affect those brute animals that feed on them out of choice, with the same smells which we perceive in them?

<Hyl>. By no means.

<Phil>. May we not therefore conclude of smells, as of the other forementioned qualities, that they cannot exist in any but a perceiving substance or mind?

<Hyl>. I think so.

<Phil>. Then as to <sounds>, what must we think of them: are they accidents really inherent in external bodies, or not?

<Hyl>. That they inhere not in the sonorous bodies is plain from hence: because a bell struck in the exhausted receiver of an air-pump sends forth no sound. The air, therefore, must be thought the subject of sound.

<Phil>. What reason is there for that, Hylas?

<Hyl>. Because, when any motion is raised in the air, we perceive a sound greater or lesser, according to the air's motion; but without some motion in the air, we never hear any sound at all.

<Phil>. And granting that we never hear a sound but when some motion is produced in the air, yet I do not see how you can infer from thence, that the sound itself is in the air.

<Hyl>. It is this very motion in the external air that produces in the mind the sensation of <sound>. For, striking on the drum of the ear, it causeth a vibration, which by the auditory nerves being communicated to the brain, the soul is thereupon affected with the sensation called <sound>.

<Phil>. What! is sound then a sensation?

<Hyl>. I tell you, as perceived by us, it is a particular sensation in the mind.

<Phil>. And can any sensation exist without the mind?

<Hyl>. No, certainly.

<Phil>. How then can sound, being a sensation, exist in the air, if by the <air> you mean a senseless substance existing without the mind?

<Hyl>. You must distinguish, Philonous, between sound as it is {182} perceived by us, and as it is in itself; or (which is the same thing) between the sound we immediately perceive, and that which exists without us. The former, indeed, is a particular

kind of sensation, but the latter is merely a vibrative or undulatory motion the air.

<Phil>. I thought I had already obviated that distinction, by answer I gave when you were applying it in a like case before. But, to say no more of that, are you sure then that sound is really nothing but motion?

<Hyl>. I am.

<Phil>. Whatever therefore agrees to real sound, may with truth be attributed to motion?

<Hyl>. It may.

<Phil>. It is then good sense to speak of <motion> as of a thing that is <loud>, <sweet>, <acute>, <or grave>.

<Hyl>. <I> see you are resolved not to understand me. Is it not evident those accidents or modes belong only to sensible sound, or <sound in> the common acceptation of the word, but not to <sound> in the real and philosophic sense; which, as I just now told you, is nothing but a certain motion of the air?

<Phil>. It seems then there are two sorts of sound -- the one vulgar, or that which is heard, the other philosophical and real?

<Hyl>. Even so.

<Phil>. And the latter consists in motion?

<Hyl>. I told you so before.

<Phil>. Tell me, Hylas, to which of the senses, think you, the idea of motion belongs? to the hearing?

<Hyl>. No, certainly; but to the sight and touch.

<Phil>. It should follow then, that, according to you, real sounds may possibly be <seen or felt>, but never <heard>.

<Hyl>. Look you, Philonous, you may, if you please, make a jest of my opinion, but that will not alter the truth of things. I own, indeed, the inferences you draw me into sound something oddly; but common language, you know, is framed by, and for the use of the vulgar: we must not therefore wonder if expressions adapted to exact philosophic notions seem uncouth and out of the way.

<Phil>. Is it come to that? I assure you, I imagine myself to have gained no small point, since you make so light of departing from common phrases and opinions; it being a main part of our inquiry, to examine whose notions are widest of the {183} common road, and most repugnant to the general sense of the world. But, can you think it no more than a philosophical paradox, to say that <real sounds are never heard>, and that the idea of them is obtained by some other sense? And is there nothing in this contrary to nature and the truth of things?

<Hyl>. To deal ingenuously, I do not like it. And, after the

concessions already made, I had as well grant that sounds too have no real being without the mind.

<Phil>. And I hope you will make no difficulty to acknowledge the same of <colours>.

<Hyl>. Pardon me: the case of colours is very different. Can anything be plainer than that we see them on the objects?

<Phil>. The objects you speak of are, I suppose, corporeal Substances existing without the mind?

<Hyl>. They are.

<Phil>. And have true and real colours inhering in them?

<Hyl>. Each visible object hath that colour which we see in it.

<Phil>. How! is there anything visible but what we perceive by sight?

<Hyl>. There is not.

<Phil>. And, do we perceive anything by sense which we do not perceive immediately?

<Hyl>. How often must I be obliged to repeat the same thing? I tell you, we do not.

<Phil>. Have patience, good Hylas; and tell me once more, whether there is anything immediately perceived by the senses, except sensible qualities. I know you asserted there was not; but I would now be informed, whether you still persist in the same opinion.

<Hyl>. I do.

<Phil>. Pray, is your corporeal substance either a sensible quality, or made up of sensible qualities?

<Hyl>. What a question that is! who ever thought it was?

<Phil>. My reason for asking was, because in saying, <each visible object hath that colour which we see in it>, you make visible objects to be corporeal substances; which implies either that corporeal substances are sensible qualities, or else that there is something besides sensible qualities perceived by sight: but, as this point was formerly agreed between us, and is still maintained by you, it is a clear consequence, that your <corporeal substance> is nothing distinct from <sensible qualities>. {184}

<Hyl>. You may draw as many absurd consequences as you please, and endeavour to perplex the plainest things; but you shall never persuade me out of my senses. I clearly understand my own meaning.

<Phil>. I wish you would make me understand it too. But, since you are unwilling to have your notion of corporeal substance examined, I shall urge that point no farther. Only be

pleased to let me know, whether the same colours which we see exist in external bodies, or some other.

<Hyl>. The very same.

<Phil>. What! are then the beautiful red and purple we see on yonder clouds really in them? Or do you imagine they have in themselves any other form than that of a dark mist or vapour?

<Hyl>. I must own, Philonous, those colours are not really in the clouds as they seem to be at this distance. They are only apparent colours.

<Phil>. <Apparent> call you them? how shall we distinguish these apparent colours from real?

<Hyl>. Very easily. Those are to be thought apparent which, appearing only at a distance, vanish upon a nearer approach.

<Phil>. And those, I suppose, are to be thought real which are discovered by the most near and exact survey.

<Hyl>. Right.

<Phil>. Is the nearest and exactest survey made by the help of a microscope, or by the naked eye?

<Hyl>. By a microscope, doubtless.

<Phil>. But a microscope often discovers colours in an object different from those perceived by the unassisted sight. And, in case we had microscopes magnifying to any assigned degree, it is certain that no object whatsoever, viewed through them, would appear in the same colour which it exhibits to the naked eye.

<Hyl>. And what will you conclude from all this? You cannot argue that there are really and naturally no colours on objects: because by artificial managements they may be altered, or made to vanish.

<Phil>. I think it may evidently be concluded from your own concessions, that all the colours we see with our naked eyes are only apparent as those on the clouds, since they vanish upon a more close and accurate inspection which is afforded us by a microscope. Then' as to what you say by way of prevention: {185} I ask you whether the real and natural state of an object is better discovered by a very sharp and piercing sight, or by one which is less sharp?

<Hyl>. By the former without doubt.

<Phil>. Is it not plain from <Dioptrics> that microscopes make the sight more penetrating, and represent objects as they would appear to the eye in case it were naturally endowed with a most exquisite sharpness?

<Hyl>. It is.

<Phil>. Consequently the microscopical representation is to be thought that which best sets forth the real nature of the

thing, or what it is in itself. The colours, therefore, by it perceived are more genuine and real than those perceived otherwise.

<Hyl>. I confess there is something in what you say.

<Phil>. Besides, it is not only possible but manifest, that there actually are animals whose eyes are by nature framed to perceive those things which by reason of their minuteness escape our sight. What think you of those inconceivably small animals perceived by glasses? must we suppose they are all stark blind? Or, in case they see, can it be imagined their sight hath not the same use in preserving their bodies from injuries, which appears in that of all other animals? And if it hath, is it not evident they must see particles less than their own bodies; which will present them with a far different view in each object from that which strikes our senses? Even our own eyes do not always represent objects to us after the same manner. In the jaundice every one knows that all things seem yellow. Is it not therefore highly probable those animals in whose eyes we discern a very different texture from that of ours, and whose bodies abound with different humours, do not see the same colours in every object that we do? From all which, should it not seem to follow that all colours are equally apparent, and that none of those which we perceive are really inherent in any outward object?

<Hyl>. It should.

<Phil>. The point will be past all doubt, if you consider that, in case colours were real properties or affections inherent in external bodies, they could admit of no alteration without some change wrought in the very bodies themselves: but, is it not evident from what hath been said that, upon the use of microscopes, upon a change happening in the burnouts of the eye, or a variation of distance, without any manner of real alteration {186} in the thing itself, the colours of any object are either changed, or totally disappear? Nay, all other circumstances remaining the same, change but the situation of some objects, and they shall present different colours to the eye. The same thing happens upon viewing an object in various degrees of light. And what is more known than that the same bodies appear differently coloured by candle-light from what they do in the open day? Add to these the experiment of a prism which, separating the heterogeneous rays of light, alters the colour of any object, and will cause the whitest to appear of a deep blue or red to the naked eye. And now tell me whether you are still of opinion that every body hath its true real colour inhering in it; and, if you think it hath, I would fain know farther from you, what certain distance and position of the object, what peculiar texture and formation of the eye, what degree or kind of light is necessary for ascertaining that true colour, and distinguishing it from apparent ones.

<Hyl>. I own myself entirely satisfied, that they are all equally apparent, and that there is no such thing as colour really inhering in external bodies, but that it is altogether in the light. And what confirms me in this opinion is, that in proportion to the light colours are still more or less vivid; and if there be no light, then are there no colours perceived. Besides, allowing there are colours on external objects, yet, how is it possible for us to perceive them? For no external body

affects the mind, unless it acts first on our organs of sense. But the only action of bodies is motion; and motion cannot be communicated otherwise than by impulse. A distant object therefore cannot act on the eye; nor consequently make itself or its properties perceivable to the soul. Whence it plainly follows that it is immediately some contiguous substance, which, operating on the eye, occasions a perception of colours: and such is light.

<Phil>. Howl is light then a substance?

<Hyl>.. I tell you, Philonous, external light is nothing but a thin fluid substance, whose minute particles being agitated with a brisk motion, and in various manners reflected from the different surfaces of outward objects to the eyes, communicate different motions to the optic nerves; which, being propagated to the brain, cause therein various impressions; and these are attended with the sensations of red, blue, yellow, &c.

<Phil>. It seems then the light doth no more than shake the optic nerves. {187}

<Hyl>. Nothing else.

<Phil>. And consequent to each particular motion of the nerves, the mind is affected with a sensation, which is some particular colour.

<Hyl>. Right.

<Phil>. And these sensations have no existence without the mind.

<Hyl>. They have not.

<Phil>. How then do you affirm that colours are in the light; since by <light> you understand a corporeal substance external to the mind?

<Hyl>. Light and colours, as immediately perceived by us, I grant cannot exist without the mind. But in themselves they are only the motions and configurations of certain insensible particles of matter.

<Phil>. Colours then, in the vulgar sense, or taken for the immediate objects of sight, cannot agree to any but a perceiving substance.

<Hyl>. That is what I say.

<Phil>. Well then, since you give up the point as to those sensible qualities which are alone thought colours by all mankind beside, you may hold what you please with regard to those invisible ones of the philosophers. It is not my business to dispute about <them>; only I would advise you to bethink yourself, whether, considering the inquiry we are upon, it be prudent for you to affirm -- <the red and blue which we see are not real colours>, <but certain unknown motions and figures which no man ever did or can see are truly so>. Are not these shocking notions, and are not they subject to as many ridiculous inferences, as those you were obliged to renounce before in the

case of sounds?

<Hyl>. I frankly own, Philonous, that it is in vain to longer. Colours, sounds, tastes, in a word all those termed <secondary qualities>, have certainly no existence without the mind. But by this acknowledgment I must not be supposed to derogate, the reality of Matter, or external objects; seeing it is no more than several philosophers maintain, who nevertheless are the farthest imaginable from denying Matter. For the clearer understanding of this, you must know sensible qualities are by philosophers divided into <Primary> and <Secondary>. The former are Extension, Figure, Solidity, Gravity, Motion, and Rest; {188} and these they hold exist really in bodies. The latter are those above enumerated; or, briefly, <all sensible qualities beside the Primary>; which they assert are only so many sensations or ideas existing nowhere but in the mind. But all this, I doubt not, you are apprised of. For my part, I have been a long time sensible there was such an opinion current among philosophers, but was never thoroughly convinced of its truth until now.

<Phil>. You are still then of opinion that <extension> and <figures are> inherent in external unthinking substances?

<Hyl>. I am.

<Phil>. But what if the same arguments which are brought against Secondary Qualities will hold good against these also?

<Hyl>. Why then I shall be obliged to think, they too exist only in the mind.

<Phil>. Is it your opinion the very figure and extension which you perceive by sense exist in the outward object or material substance?

<Hyl>. It is.

<Phil>. Have all other animals as good grounds to think the same of the figure and extension which they see and feel?

<Hyl>. Without doubt, if they have any thought at all.

<Phil>. Answer me, Hylas. Think you the senses were bestowed upon all animals for their preservation and well-being in life? or were they given to men alone for this end?

<Hyl>. I make no question but they have the same use in all other animals.

<Phil>. If so, is it not necessary they should be enabled by them to perceive their own limbs, and those bodies which are capable of harming them?

<Hyl>. Certainly.

<Phil>. A mite therefore must be supposed to see his own foot, and things equal or even less than it, as bodies of some considerable dimension; though at the same time they appear to you scarce discernible, or at best as so many visible points?

<Hyl>. I cannot deny it.

<Phil>. And to creatures less than the mite they will seem yet larger?

<Hyl>. They will.

<Phil>. Insomuch that what you can hardly discern will to another extremely minute animal appear as some huge mountain? {189}

<Hyl>. All this I grant.

<Phil>. Can one and the same thing be at the same time in itself of different dimensions?

<Hyl>. That were absurd to imagine.

<Phil>. But, from what you have laid down it follows that both the extension by you perceived, and that perceived by the mite itself, as likewise all those perceived by lesser animals, are each of them the true extension of the mite's foot; that is to say, by your own principles you are led into an absurdity.

<Hyl>. There seems to be some difficulty in the point.

<Phil>. Again, have you not acknowledged that no real inherent property of any object can be changed without some change in the thing itself?

<Hyl>. I have.

<Phil>. But, as we approach to or recede from an object, the visible extension varies, being at one distance ten or a hundred times greater than another. Doth it not therefore follow from hence likewise that it is not really inherent in the object?

<Hyl>. I own I am at a loss what to think.

<Phil>. Your judgment will soon be determined, if you will venture to think as freely concerning this quality as you have done concerning the rest. Was it not admitted as a good argument, that neither heat nor cold was in the water, because it seemed warm to one hand and cold to the other?

<Hyl>. It was.

<Phil>. Is it not the very same reasoning to conclude, there is no extension or figure in an object, because to one eye it shall seem little, smooth, and round, when at the same time it appears to the other, great, uneven, and regular?

<Hyl>. The very same. But does this latter fact ever happen?

<Phil>. You may at any time make the experiment, by looking with one eye bare, and with the other through a microscope.

<Hyl>. I know not how to maintain it; and yet I am loath to give up <extension>, I see so many odd consequences following upon such a concession.

<Phil>. Odd, say you? After the concessions already made, I hope you will stick at nothing for its oddness. [But, on the

other hand, should it not seem very odd, if the general reasoning {190} which includes all other sensible qualities did not also include extension? If it be allowed that no idea, nor anything like an idea, can exist in an unperceiving substance, then surely it follows that no figure, or mode of extension, which we can either perceive, or imagine, or have any idea of, can be really inherent in Matter; not to mention the peculiar difficulty there must be in conceiving a material substance, prior to and distinct from extension to be the <substratum> of extension. Be the sensible quality what it will -- figure, or sound, or colour, it seems alike impossible it should subsist in that which doth not perceive it.][2]

<Hyl>. I give up the point for the present, reserving still a right to retract my opinion, in case I shall hereafter discover any false step in my progress to it.

<Phil>. That is a right you cannot be denied. Figures and extension being despatched, we proceed next to <motion>. Can a real motion in any external body be at the same time very swift and very slow?

<Hyl>. It cannot.

<Phil>. Is not the motion of a body swift in a reciprocal proportion to the time it takes up in describing any given space? Thus a body that describes a mile in an hour moves three times faster than it would in case it described only a mile in three hours.

<Hyl>. I agree with you.

<Phil>. And is not time measured by the succession of ideas in our minds?

<Hyl>. It is.

<Phil>. And is it not possible ideas should succeed one another twice as fast in your mind as they do in mine, or in that of some spirit of another kind?

<Hyl>. I own it.

<Phil>. Consequently the same body may to another seem to perform its motion over any space in half the time that it doth to you. And the same reasoning will hold as to any other proportion: that is to say, according to your principles (since the motions perceived are both really in the object) it is possible one and the same body shall be really moved the same way at once, both very swift and very slow. How is this consistent either with common sense, or with what you just now granted? {191}

<Hyl>. I have nothing to say to it.

<Phil>. Then as for <solidity>; either you do not mean any sensible quality by that word, and so it is beside our inquiry: or if you do, it must be either hardness or resistance. But both the one and the other are plainly relative to our senses: it being evident that what seems hard to one animal may appear soft to another, who hath greater force and firmness of limbs. Nor is

it less plain that the resistance I feel is not in the body.

<Hyl>. I own the very <sensation> of resistance, which is all you immediately perceive, is not in the body; but the <cause> of that sensation is.

<Phil>. But the causes of our sensations are not things immediately perceived, and therefore are not sensible. This point I thought had been already determined.

<Hyl>. I own it was; but you will pardon me if I seem a little embarrassed: I know not how to quit my old notions.

<Phil>. To help you out, do but consider that if <extension> be once acknowledged to have no existence without the mind, the same must necessarily be granted of motion, solidity, and gravity; since they all evidently suppose extension. It is therefore superfluous to inquire particularly concerning each of them. In denying extension, you have denied them all to have any real existence.

<Hyl>. I wonder, Philonous, if what you say be true, why those philosophers who deny the Secondary Qualities any real existence should yet attribute it to the Primary. If there is no difference between them, how can this be accounted for?

<Phil>. It is not my business to account for every opinion of the philosophers. But, among other reasons which may be assigned for this, it seems probable that pleasure and pain being rather annexed to the former than the latter may be one. Heat and cold, tastes and smells, have something more vividly pleasing or disagreeable than the ideas of extension, figure, and motion affect us with. And, it being too visibly absurd to hold that pain or pleasure can be in an unperceiving substance, men are more easily weaned from believing the external existence of the Secondary than the Primary Qualities. You will be satisfied there is something in this, if you recollect the difference you made between an intense and more moderate degree of heat; allowing the one a real existence, while you denied it to the other. But, after all, there is no rational ground for that distinction; for, surely an indifferent sensation is as {191} truly <a sensation> as one more pleasing or painful; and consequently should not any more than they be supposed to exist in an unthinking subject.

<Hyl>. It is just come into my head, Philonous, that I have somewhere heard of a distinction between absolute and sensible extension. Now, though it be acknowledged that <great> and <small>, consisting merely in the relation which other extended beings have to the parts of our own bodies, do not really inhere in the substances themselves; yet nothing obliges us to hold the same with regard to <absolute extension>, which is something abstracted from <great> and <small>, from this or that particular magnitude or figure. So likewise as to motion; <swift> and <slow> are altogether relative to the succession of ideas in our own minds. But, it doth not follow, because those modifications of motion exist not without the mind, that therefore absolute motion abstracted from them doth not.

<Phil>. Pray what is it that distinguishes one motion, or one part of extension, from another? Is it not something sensible, as some degree of swiftness or slowness, some certain

magnitude or figure peculiar to each?

<Hyl>. I think so.

<Phil>. These qualities, therefore, stripped of all sensible properties, are without all specific and numerical differences, as the schools call them.

<Hyl>. They are.

<Phil>. That is to say, they are extension in general, and motion in general.

<Hyl>. Let it be so.

<Phil>. But it is a universally received maxim that <Everything which exists is particular>. How then can motion in general, or extension in general, exist in any corporeal substance? {193}

<Hyl>. I will take time to solve your difficulty.

<Phil>. But I think the point may be speedily decided. Without doubt you can tell whether you are able to frame this or that idea. Now I am content to put our dispute on this issue. If you can frame in your thoughts a distinct <abstract idea> of motion or extension, divested of all those sensible modes, as swift and slow, great and small, round and square, and the like, which are acknowledged to exist only in the mind, I will then yield the point you contend for. But if you cannot, it will be unreasonable on your side to insist any longer upon what you have no notion of.

<Hyl>. To confess ingenuously, I cannot.

<Phil>. Can you even separate the ideas of extension and motion from the ideas of all those qualities which they who make the distinction term <secondary>?

<Hyl>. What! is it not an easy matter to consider extension and motion by themselves, abstracted from all other sensible qualities? Pray how do the mathematicians treat of them?

<Phil>. I acknowledge, Hylas, it is not difficult to form general propositions and reasonings about those qualities, without mentioning any other; and, in this sense, to consider or treat of them abstractedly. But, how doth it follow that, because I can pronounce the word <motion> by itself, I can form the idea of it in my mind exclusive of body? or, because theorems may be made of extension and figures, without any mention of <great> or <small>, or any other sensible mode or quality, that therefore it is possible such an abstract idea of extension, without any particular size or figure, or sensible quality,[3] [should be distinctly formed, and apprehended by the mind? Mathematicians treat of quantity, without regarding what other sensible. qualities it is attended with, as being altogether indifferent to their demonstrations. But, when laying aside the words, they contemplate the bare ideas, I believe you will find, they are not the pure abstracted ideas of extension.

<Hyl>. But what say you to <pure intellect>? May not

abstracted ideas be framed by that faculty?

<Phil>. Since I cannot frame abstract ideas at all, it is plain I cannot frame them by the help of <pure intellect>; {194} whatsoever faculty you understand by those words. Besides, not to inquire into the nature of pure intellect and its spiritual objects, as <virtue>, <reason>, <God>, or the like, thus much seems manifest -- that sensible things are only to be perceived by sense, or represented by the imagination. Figures, therefore, and extension, being originally perceived by sense, do not belong to pure intellect: but, for your farther satisfaction, try if you can frame the idea of any figure, abstracted from all particularities of size, or even from other sensible qualities.

<Hyl>. Let me think a little -- I do not find that I can.

<Phil>. And can you think it possible that should really exist in nature which implies a repugnancy in its conception?

<Hyl>. By no means.

<Phil>. Since therefore it is impossible even for the mind to disunite the ideas of extension and motion from all other sensible qualities, doth it not follow, that where the one exist there necessarily the other exist likewise?

<Hyl>. It should seem so.

<Phil>. Consequently, the very same arguments which you admitted as conclusive against the Secondary Qualities are, without any farther application of force, against the Primary too. Besides, if you will trust your senses, is it not plain all sensible qualities coexist, or to them appear as being in the same place? Do they ever represent a motion, or figure, as being divested of all other visible and tangible qualities?

<Hyl>. You need say no more on this head. I am free to own, if there be no secret error or oversight in our proceedings hitherto, that all sensible qualities are alike to be denied existence without the mind. But, my fear is that I have been too liberal in my former concessions, or overlooked some fallacy or other. In short, I did not take time to think.

<Phil>. For that matter, Hylas, you may take what time you please in reviewing the progress of our inquiry. You are at liberty to recover any slips you might have made, or offer whatever you have omitted which makes for your first opinion.

<Hyl>. One great oversight I take to be this -- that I did not sufficiently distinguish the <object> from the <sensation>. Now, though this latter may not exist without the mind, yet it will not thence follow that the former cannot.

<Phil>. What object do you mean? the object of the senses?

<Hyl>. The same.

<Phil>. It is then immediately perceived? {195}

<Hyl>. Right.

<Phil>. Make me to understand the difference between what is immediately perceived and a sensation.

<Hyl>. The sensation I take to be an act of the mind perceiving; besides which, there is something perceived; and this I call the <object>. For example, there is red and yellow on that tulip. But then the act of perceiving those colours is in me only, and not in the tulip.

<Phil>. What tulip do you speak of? Is it that which you see?

<Hyl>. The same.

<Phil>. And what do you see beside colour, figure, and extension?

<Hyl>. Nothing.

<Phil>. What you would say then is that the red and yellow are coexistent with the extension; is it not?

<Hyl>. That is not all; I would say they have a real existence without the mind, in some unthinking substance.

<Phil>. That the colours are really in the tulip which I see is manifest. Neither can it be denied that this tulip may exist independent of your mind or mine; but, that any immediate object of the senses, -- that is, any idea, or combination of ideas -- should exist in an unthinking substance, or exterior to <all> minds, is in itself an evident contradiction. Nor can I imagine how this follows from what you said just now, to wit, that the red and yellow were on the tulip <you saw>, since you do not pretend to <see> that unthinking substance.

<Hyl>. You have an artful way, Philonous, of diverting our inquiry from the subject.

<Phil>. I see you have no mind to be pressed that way. To return then to your distinction between <sensation> and <object>; if I take you right, you distinguish in every perception two things, the one an action of the mind, the other not.

<Hyl>. True.

<Phil>. And this action cannot exist in, or belong to, any unthinking thing; but, whatever beside is implied in a perception may? {196}

<Hyl>. That is my meaning.

<Phil>. So that if there was a perception without any act of the mind, it were possible such a perception should exist in an unthinking substance?

<Hyl>. I grant it. But it is impossible there should be such a perception.

<Phil>. When is the mind said to be active?

<Hyl>. When it produces, puts an end to, or changes,

anything.

<Phil>. Can the mind produce, discontinue, or change anything, but by an act of the will?

<Hyl>. It cannot.

<Phil>. The mind therefore is to be accounted <active> in its perceptions so far forth as <volition> is included in them?

<Hyl>. It is.

<Phil>. In plucking this flower I am active; because I do it by the motion of my hand, which was consequent upon my volition; so likewise in applying it to my nose. But is either of these smelling?

<Hyl>. <No>.

<Phil>. I act too in drawing the air through my nose; because my breathing so rather than otherwise is the effect of my volition. But neither can this be called <smelling>: for, if it were, I should smell every time I breathed in that manner?

<Hyl>. True.

<Phil>. Smelling then is somewhat consequent to all this?

<Hyl>. It is.

<Phil>. But I do not find my will concerned any farther. Whatever more there is -- as that I perceive such a particular smell, or any smell at all -- this is independent of my will, and therein I am altogether passive. Do you find it otherwise with you, Hylas?

<Hyl>. No, the very same.

<Phil>. Then, as to seeing, is it not in your power to open your eyes, or keep them shut; to turn them this or that way?

<Hyl>. Without doubt.

<Phil>. But, doth it in like manner depend on <your> will that in looking on this flower you perceive <white> rather than any other colour? Or, directing your open eyes towards yonder part of the heaven, can you avoid seeing the sun? Or is light or darkness the effect of your volition?

<Hyl>. No, certainly.

<Phil>. You are then in these respects altogether passive?
{197}
<Hyl>. I am.

<Phil>. Tell me now, whether <seeing> consists in perceiving light and colours, or in opening and turning the eyes?

<Hyl>. Without doubt, in the former.

<Phil>. Since therefore you are in the very perception of

light and colours altogether passive, what is become of that action you were speaking of as an ingredient in every sensation? And, doth it not follow from your own concessions, that the perception of light and colours, including no action in it, may exist in an unperceiving substance? And is not this a plain contradiction?

<Hyl>. I know not what to think of it.

<Phil>. Besides, since you distinguish the <active> and <passive> in every perception, you must do it in that of pain. But how is it possible that pain, be it as little active as you please, should exist in an unperceiving substance? In short, do but consider the point, and then confess ingenuously, whether light and colours, tastes, sounds, &c. are not all equally passions or sensations in the soul. You may indeed call them <external objects>, and give them in words what subsistence you please. But, examine your own thoughts, and then tell me whether it be not as I say?

<Hyl>. I acknowledge, Philonous, that, upon a fair observation of what passes in my mind, I can discover nothing else but that I am a thinking being, affected with variety of sensations; neither is it possible to conceive how a sensation should exist in an unperceiving substance. But then, on the other hand, when I look on sensible things in a different view, considering them as so many modes and qualities, I find it necessary to suppose a <material substratum>, without which they cannot be conceived to exist.

<Phil>. <Material substratum> call you it? Pray, by which of your senses came you acquainted with that being?

<Hyl>. It is not itself sensible; its modes and qualities only being perceived by the senses.

<Phil>. I presume then it was by reflexion and reason you obtained

the idea of it?

<Hyl>. I do not pretend to any proper positive <idea> of it. However, I conclude it exists, because qualities cannot be conceived to exist without a support.

<Phil>. It seems then you have only a relative <notion> of it, or that you conceive it not otherwise than by conceiving the relation it bears to sensible qualities? {198}

<Hyl>. Right.

<Phil>. Be pleased therefore to let me know wherein that relation

consists.

<Hyl>. Is it not sufficiently expressed in the term <substratum>, or <substance>?

<Phil>. If so, the word <substratum> should import that it is spread under the sensible qualities or accidents?

<Hyl>. True.

<Phil>. And consequently under extension?

<Hyl>. I own it.

<Phil>. It is therefore somewhat in its own nature entirely distinct

from extension?

<Hyl>. I tell you, extension is only a mode, and Matter is something that supports modes. And is it not evident the thing supported is different from the thing supporting?

<Phil>. So that something distinct from, and exclusive of, extension is supposed to be the <substratum> of extension?

<Hyl>. Just so.

<Phil>. Answer me, Hylas. Can a thing be spread without extension? or is not the idea of extension necessarily included in <spreading>?

<Hyl>. It is.

<Phil>. Whatsoever therefore you suppose spread under anything must have in itself an extension distinct from the extension of that thing under which it is spread?

<Hyl>. It must.

<Phil>. Consequently, every corporeal substance, being the <substratum> of extension, must have in itself another extension, by which it is qualified to be a <substratum>: and so on to infinity. And I ask whether this be not absurd in itself, and repugnant to what you granted just now, to wit, that the <substratum> was something distinct from and exclusive of extension?

<Hyl>. Aye but, Philonous, you take me wrong. I do not mean that Matter is <spread> in a gross literal sense under extension. The word <substratum> is used only to express in general the same thing with <substance>.

<Phil>. Well then, let us examine the relation implied in the term <substance>. Is it not that it stands under accidents?

<Hyl>. The very same.

<Phil>. But, that one thing may stand under or support another, must it not be extended?

<Hyl>. It must. {199}

<Phil>. Is not therefore this supposition liable to the same absurdity with the former?

<Hyl>. You still take things in a strict literal sense. That is not fair, Philonous.

<Phil>. I am not for imposing any sense on your words: you are at liberty to explain them as you please. Only, I beseech you, make me understand something by them. You tell me Matter supports or stands under accidents. How! is it as your legs support your body?

<Hyl>. No; that is the literal sense.

<Phil>. Pray let me know any sense, literal or not literal, that you understand it in. -- How long must I wait for an answer, Hylas?

<Hyl>. I declare I know not what to say. I once thought I understood well enough what was meant by Matter's supporting accidents. But now, the more I think on it the less can I comprehend it: in short I find that I know nothing of it.

<Phil>. It seems then you have no idea at all, neither relative nor positive, of Matter; you know neither what it is in itself, nor what relation it bears to accidents?

<Hyl>. I acknowledge it.

<Phil>. And yet you asserted that you could not conceive how qualities or accidents should really exist, without conceiving at the same time a material support of them?

<Hyl>. I did.

<Phil>. That is to say, when you conceive the real existence of qualities, you do withal conceive Something which you cannot conceive?

<Hyl>. It was wrong, I own. But still I fear there is some fallacy or other. Pray what think you of this? It is just come into my head that the ground of all our mistake lies in your treating of each quality by itself. Now, I grant that each quality cannot singly subsist without the mind. Colour cannot without extension, neither can figure without some other sensible quality. But, as the several qualities united or blended together form entire sensible things, nothing hinders why such things may not be supposed to exist without the mind.

<Phil>. Either, Hylas, you are jesting, or have a very bad memory. Though indeed we went through all the qualities by name one after another, yet my arguments or rather your concessions, nowhere tended to prove that the Secondary Qualities did not subsist each alone by itself; but, that they were not {200} <at all> without the mind. Indeed, in treating of figure and motion we concluded they could not exist without the mind, because it was impossible even in thought to separate them from all secondary qualities, so as to conceive them existing by themselves. But then this was not the only argument made use of upon that occasion. But (to pass by all that hath been hitherto said, and reckon it for nothing, if you will have it so) I am content to put the whole upon this issue. If you can conceive it possible for any mixture or combination of qualities, or any sensible object whatever, to exist without the mind, then I will grant it actually to be so.

<Hyl>. If it comes to that the point will soon be decided. What more easy than to conceive a tree or house existing by itself, independent of, and unperceived by, any mind whatsoever? I do at this present time conceive them existing after that manner.

<Phil>. How say you, Hylas, can you see a thing which is at the same time unseen?

<Hyl>. No, that were a contradiction.

<Phil>. Is it not as great a contradiction to talk of <conceiving> a thing which is <unconceived>?

<Hyl>. It is.

<Phil>. The, tree or house therefore which you think of is conceived by you?

<Hyl>. How should it be otherwise?

<Phil>. And what is conceived is surely in the mind?

<Hyl>. Without question, that which is conceived is in the mind.

<Phil>. How then came you to say, you conceived a house or tree existing independent and out of all minds whatsoever?

<Hyl>. That was I own an oversight; but stay, let me consider what led me into it. -- It is a pleasant mistake enough. As I was thinking of a tree in a solitary place, where no one was present to see it, methought that was to conceive a tree as existing unperceived or unthought of; not considering that I myself conceived it all the while. But now I plainly see that all I can do is to frame ideas in my own mind. I may indeed conceive in my own thoughts the idea of a tree, or a house, or a mountain, but that is all. And this is far from proving that I can conceive them <existing out of the minds of all Spirits>.

<Phil>. You acknowledge then that you cannot possibly conceive how any one corporeal sensible thing should exist otherwise than in the mind? {201}

<Hyl>. I do.

<Phil>. And yet you will earnestly contend for the truth of that which you cannot so much as conceive?

<Hyl>. I profess I know not what to think; but still there are some scruples remain with me. Is it not certain I <see things at> a distance? Do we not perceive the stars and moon, for example, to be a great way off? Is not this, I say, manifest to the senses?

<Phil>. Do you not in a dream too perceive those or the like objects?

<Hyl>. I do.

<Phil>. And have they not then the same appearance of being

distant?

<Hyl>. They have.

<Phil>. But you do not thence conclude the apparitions in a dream to be without the mind?

<Hyl>. By no means.

<Phil>. You ought not therefore to conclude that sensible objects are without the mind, from their appearance, or manner wherein they are perceived.

<Hyl>. I acknowledge it. But doth not my sense deceive me in those cases?

<Phil>. By no means. The idea or thing which you immediately perceive, neither sense nor reason informs you that it actually exists without the mind. By sense you only know that you are affected with such certain sensations of light and colours, &c. And these you will not say are without the mind.

<Hyl>. True: but, beside all that, do you not think the sight suggests something of <outness or distance>?

<Phil>. Upon approaching a distant object, do the visible size and figure change perpetually, or do they appear the same at all distances?

<Hyl>. They are in a continual change.

<Phil>. Sight therefore doth not suggest, or any way inform you, that the visible object you immediately perceive exists at a distance, or will be perceived when you advance farther onward; there being a continued series of visible objects succeeding each other during the whole time of your approach.

<Hyl>. It doth not; but still I know, upon seeing an object, what object I shall perceive after having passed over a certain distance: {202} no matter whether it be exactly the same or no: there is still something of distance suggested in the case.

<Phil>. Good Hylas, do but reflect a little on the point, and then tell me whether there be any more in it than this: from the ideas you actually perceive by sight, you have by experience learned to collect what other ideas you will (according to the standing order of nature) be affected with, after such a certain succession of time and motion.

<Hyl>. Upon the whole, I take it to be nothing else.

<Phil>. Now, is it not plain that if we suppose a man born blind was on a sudden made to see, he could at first have no experience of what may be <suggested> by sight?

<Hyl>. It is.

<Phil>. He would not then, according to you, have any notion of distance annexed to the things he saw; but would take them for a new set of sensations, existing only in his mind?

<Hyl>. It is undeniable.

<Phil>. But, to make it still more plain: is not <distance> a line turned endwise to the eye?

<Hyl>. It is.

<Phil>. And can a line so situated be perceived by sight?

<Hyl>. It cannot.

<Phil>. Doth it not therefore follow that distance is not properly and immediately perceived by sight?

<Hyl>. It should seem so.

<Phil>. Again, is it your opinion that colours are at a distance?

<Hyl>. It must be acknowledged they are only in the mind.

<Phil>. But do not colours appear to the eye as coexisting in the same place with extension and figures?

<Hyl>. They do.

<Phil>. How can you then conclude from sight that figures exist without, when you acknowledge colours do not; the sensible appearance being the very same with regard to both?

<Hyl>. I know not what to answer.

<Phil>. But, allowing that distance was truly and immediately perceived by the mind, yet it would not thence follow it existed out of the mind. For, whatever is immediately perceived is an idea: and can any idea exist out of the mind?

<Hyl>. To suppose that were absurd: but, inform me, Philonous, can we perceive or know nothing beside our ideas?

<Phil>. As for the rational deducing of causes from effects, {203} that is beside our inquiry. And, by the senses you can best tell whether you perceive anything which is not immediately perceived. And I ask you, whether the things immediately perceived are other than your own sensations or ideas? You have indeed more than once, in the course of this conversation, declared yourself on those points; but you seem, by this last question, to have departed from what you then thought.

<Hyl>. To speak the truth, Philonous, I think there are two kinds of objects: -- the one perceived immediately, which are likewise called <ideas>; the other are real things or external objects, perceived by the mediation of ideas, which are their images and representations. Now, I own ideas do not exist without the mind; but the latter sort of objects do. I am sorry I did not think of this distinction sooner; it would probably have cut short your discourse.

<Phil>. Are those external objects perceived by sense or by some other faculty?

<Hyl>. They are perceived by sense.

<Phil>. Howl Is there any thing perceived by sense which is not immediately perceived?

<Hyl>. Yes, Philonous, in some sort there is. For example, when I look on a picture or statue of Julius Caesar, I may be said after a manner to perceive him (though not immediately) by my senses.

<Phil>. It seems then you will have our ideas, which alone are immediately perceived, to be pictures of external things: and that these also are perceived by sense, inasmuch as they have a conformity or resemblance to our ideas?

<Hyl>. That is my meaning.

<Phil>. And, in the same way that Julius Caesar, in himself invisible, is nevertheless perceived by sight; real things, in themselves imperceptible, are perceived by sense.

<Hyl>. In the very same.

<Phil>. Tell me, Hylas, when you behold the picture of Julius Caesar, do you see with your eyes any more than some colours and figures, with a certain symmetry and composition of the whole?

<Hyl>. Nothing else.

<Phil>. And would not a man who had never known anything of Julius Caesar see as much? {204}

<Hyl>. He would.

<Phil>. Consequently he hath his sight, and the use of it, in as perfect a degree as you?

<Hyl>. I agree with you.

<Phil>. Whence comes it then that your thoughts are directed to the Roman emperor, and his are not? This cannot proceed from the sensations or ideas of sense by you then perceived; since you acknowledge you have no advantage over him in that respect. It should seem therefore to proceed from reason and memory: should it not?

<Hyl>. It should.

<Phil>. Consequently, it will not follow from that instance that anything is perceived by sense which is not, immediately perceived. Though I grant we may, in one acceptation, be said to perceive sensible things mediately by sense: that is, when, from a frequently perceived connexion, the immediate perception of ideas by one sense <suggests> to the mind others, perhaps belonging to another sense, which are wont to be connected with them. For instance, when I hear a coach drive along the streets, immediately I perceive only the sound; but, from the experience I have had that such a sound is connected with a coach, I am said to hear the coach. It is nevertheless evident that, in truth and strictness, nothing can be <heard but sound>; and the coach is

not then properly perceived by sense, but suggested from experience. So likewise when we are said to see a red-hot bar of iron; the solidity and heat of the iron are not the objects of sight, but suggested to the imagination by the colour and figure which are properly perceived by that sense. In short, those things alone are actually and strictly perceived by any sense, which would have been perceived in case that same sense had then been first conferred on us. As for other things, it is plain they are only suggested to the mind by experience, grounded on former perceptions. But, to return to your comparison of Caesar's picture, it is plain, if you keep to that, you must hold the real things, or archetypes of our ideas, are not perceived by sense, but by some internal faculty of the soul, as reason or memory. I would therefore fain know what arguments you can draw from reason for the existence of what you call <real things or material objects>. Or, whether you remember to have seen them formerly as they are in themselves; or, if you have heard or read of any one that did. {205}

<Hyl>. I see, Philonous, you are disposed to raillery; but that will never convince me.

<Phil>. My aim is only to learn from you the way to come at the knowledge of <material beings>. Whatever we perceive is perceived immediately or mediately: by sense, or by reason and reflexion. But, as you have excluded sense, pray shew me what reason you have to believe their existence; or what <medium> you can possibly make use of to prove it, either to mine or your own understanding.

<Hyl>. To deal ingenuously, Philonous, now I consider the point, I do not find I can give you any good reason for it. But, thus much seems pretty plain, that it is at least possible such things may really exist. And, as long as there is no absurdity in supposing them, I am resolved to believe as I did, till you bring good reasons to the contrary.

<Phil>. What! Is it come to this, that you only <believe> the existence of material objects, and that your belief is founded barely on the possibility of its being true? Then you will have me bring reasons against it: though another would think it reasonable the proof should lie on him who holds the affirmative. And, after all, this very point which you are now resolved to maintain, without any reason, is in effect what you have more than once during this discourse seen good reason to give up. But, to pass over all this; if I understand you rightly, you say our ideas do not exist without the mind, but that they are copies, images, or representations, of certain originals that do?

<Hyl>. You take me right.

<Phil>. They are then like external things?

<Hyl>. They are.

<Phil>. Have those things a stable and permanent nature, independent of our senses; or are they in a perpetual change, upon our producing any motions in our bodies -- suspending, exerting, or altering, our faculties or organs of sense?

<Hyl>. Real things, it is plain, have a fixed and real nature, which remains the same notwithstanding any change in our senses, or in the posture and motion of our bodies; which indeed may affect the ideas in our minds, but it were absurd to think they had the same effect on things existing without the mind.

<Phil>. How then is it possible that things perpetually fleeting and variable as our ideas should be copies or images of anything fixed and constant? Or, in other words, since all sensible {206} qualities, as size, figure, colour, &c., that is, our ideas, are continually changing, upon every alteration in the distance, medium, or instruments of sensation; how can any determinate material objects be properly represented or painted forth by several distinct things, each of which is so different from and unlike the rest? Or, if you say it resembles some one only of our ideas, how shall we be able to distinguish the true copy from all the false ones?

<Hyl>. I profess, Philonous, I am at a loss. I know not what to say to this.

<Phil>. But neither is this all. Which are material objects in themselves -- perceptible or imperceptible?

<Hyl>. Properly and immediately nothing can be perceived but ideas. All material things, therefore, are in themselves insensible, and to be perceived only by our ideas.

<Phil>. Ideas then are sensible, and their archetypes or originals insensible?

<Hyl>. Right.

<Phil>. But how can that which is sensible be like that which is insensible? Can a real thing, in itself <invisible>, be like a <colour>; or a real thing, which is not <audible>, be like a <sound>? In a word, can anything be like a sensation or idea, but another sensation or idea?

<Hyl>. I must own, I think not.

<Phil>. Is it possible there should be any doubt on the point? Do. you not perfectly know your own ideas?

<Hyl>. I know them perfectly; since what I do not perceive or know can be no part of my idea.

<Phil>. Consider, therefore, and examine them, and then tell me if there be anything in them which can exist without the mind: or if you can conceive anything like them existing without the mind.

<Hyl>. Upon inquiry, I find it is impossible for me to conceive or understand how anything but an idea can be like an idea. And it is most evident that <no idea can exist without the mind>.

<Phil>. You are therefore, by your principles, forced to deny the <reality> of sensible things; since you made it to consist in an absolute existence exterior to the mind. That is to say, you are a downright sceptic. So I have gained my point,

which was to shew your principles led to Scepticism. {207}

<Hyl>. For the present I am, if not entirely convinced, at least silenced.

<Phil>. I would fain know what more you would require in order to a perfect conviction. Have you not had the liberty of explaining yourself all manner of ways? Were any little slips in discourse laid hold and insisted on? Or were you not allowed to retract or reinforce anything you had offered, as best served your purpose? Hath not everything you could say been heard and examined with all the fairness imaginable? In a word have you not in every point been convinced out of your own mouth? And, if you can at present discover any flaw in any of your former concessions, or think of any remaining subterfuge, any new distinction, colour, or comment whatsoever, why do you not produce it?

<Hyl>. A little patience, Philonous. I am at present so amazed to see myself ensnared, and as it were imprisoned in the labyrinths you have drawn me into, that on the sudden it cannot be expected I should find my way out. You must give me time to look about me and recollect myself.

<Phil>. Hark; is not this the college bell?

<Hyl>. It rings for prayers.

<Phil>. We will go in then, if you please, and meet here again tomorrow morning. In the meantime, you may employ your thoughts on this morning's discourse, and try if you can find any fallacy in it, or invent any new means to extricate yourself.

<Hyl>. Agreed. {208}

THE SECOND DIALOGUE

<Hylas>. I beg your pardon, Philonous, for not meeting you sooner. All this morning my head was so filled with our late conversation that I had not leisure to think of the time of the day, or indeed of anything else.

<Philonous>. I am glad you were so intent upon it, in hopes if there were any mistakes in your concessions, or fallacies in my reasonings from them, you will now discover them to me.

<Hyl>. I assure you I have done nothing ever since I saw you but search after mistakes and fallacies, and, with that view, have minutely examined the whole series of yesterday's discourse: but all in vain, for the notions it led me into, upon review, appear still more clear and evident; and, the more I consider them, the more irresistibly do they force my assent.

<Phil>. And is not this, think you, a sign that they are genuine, that they proceed from nature, and are conformable to right reason? Truth and beauty are in this alike, that the strictest survey sets them both off to advantage; while the false lustre of error and disguise cannot endure being reviewed, or too nearly inspected.

<Hyl>. I own there is a great deal in what you say. Nor can any one be more entirely satisfied of the truth of those odd consequences, so long as I have in view the reasonings that lead to them. But, when these are out of my thoughts, there seems, on the other hand, something so satisfactory, so natural and intelligible, in the modern way of explaining things that, I profess, I know not how to reject it.

<Phil>. I know not what way you mean.

<Hyl>. I mean the way of accounting for our sensations or ideas.

<Phil>. How is that?

<Hyl>. It is supposed the soul makes her residence in some part of the brain, from which the nerves take their rise, and are thence extended to all parts of the body; and that outward objects, by the different impressions they make on the organs of sense, communicate certain vibrative motions to the nerves; and these being filled with spirits propagate them to the brain {209} or seat of the soul, which, according to the various impressions or traces thereby made in the brain, is variously affected with ideas.

<Phil>. And call you this an explication of the manner whereby we are affected with ideas?

<Hyl>. Why not, Philonous? Have you anything to object against it?

<Phil>. I would first know whether I rightly understand your hypothesis. You make certain traces in the brain to be the causes or occasions of our ideas. Pray tell me whether by the <brain> you mean any sensible thing.

<Hyl>. What else think you I could mean?

<Phil>. Sensible things are all immediately perceivable; and those things which are immediately perceivable are ideas; and these exist only in the mind. Thus much you have, if I mistake not, long since agreed to.

<Hyl>. I do not deny it.

<Phil>. The brain therefore you speak of, being a sensible thing, exists only in the mind. Now, I would fain know whether you think it reasonable to suppose that one idea or thing existing in the mind occasions all other ideas. And, if you think so, pray how do you account for the origin of that primary idea or brain itself?

<Hyl>. I do not explain the origin of our ideas by that brain which is perceivable to sense -- this being itself only a combination of sensible ideas -- but by another which I imagine.

<Phil>. But are not things imagined as truly <in the mind> as things perceived?

<Hyl>. I must confess they are.

<Phil>. It comes, therefore, to the same thing; and you have been all this while accounting for ideas by certain motions or impressions of the brain; that is, by some alterations in an idea, whether sensible or imaginable it matters not.

<Hyl>. I begin to suspect my hypothesis.

<Phil>. Besides spirits, all that we know or conceive are our own ideas. When, therefore, you say all ideas are occasioned by impressions in the brain, do you conceive this brain or no? If you do, then you talk of ideas imprinted in an idea causing that same idea, which is absurd. If you do not conceive it, you talk unintelligibly, instead of forming a reasonable hypothesis. {210}

<Hyl>. I now clearly see it was a mere dream. There is nothing in it.

<Phil>. You need not be much concerned at it; for after all, this way of explaining things, as you called it, could never have satisfied any reasonable man. What connexion is there between a motion in the nerves, and the sensations of sound or colour in the mind? Or how is it possible these should be the effect of that?

<Hyl>. But I could never think it had so little in it as now it seems to have.

<Phil>. Well then, are you at length satisfied that no sensible things have a real existence; and that you are in truth an arrant sceptic?

<Hyl>. It is too plain to be denied.

<Phil>. Look! are not the fields covered with a delightful verdure? Is there not something in the woods and groves, in the rivers and clear springs, that soothes, that delights, that transports the soul? At the prospect of the wide and deep ocean, or some huge mountain whose top is lost in the clouds, or of an old gloomy forest, are not our minds filled with a pleasing horror? Even in rocks and deserts is there not an agreeable wildness? How sincere a pleasure is it to behold the natural beauties of the earth! To preserve and renew our, relish for them, is not the veil of night alternately drawn over her face, and doth she not change her dress with the seasons? How aptly are the elements disposed! What variety and use [in the meanest productions of nature]![4] What delicacy, what beauty, what contrivance, in animal and vegetable bodies I How exquisitely are all things suited, as well to their particular ends, as to constitute opposite parts of the whole I And, while they mutually aid and support, do they not also set off and illustrate each other? Raise now your thoughts from this ball of earth to all those glorious luminaries that adorn the high arch of heaven. The motion and situation of the planets, are they not admirable for use and order? Were those (miscalled <erratic>) globes once known to stray, in their repeated journeys through the pathless void? Do they not measure areas round the sun ever proportioned to the times? So fixed, so immutable are the laws by which the unseen Author of nature actuates the universe. {211} How vivid and radiant is the lustre of the fixed stars! How magnificent and rich that negligent profusion with which they appear to be

scattered throughout the whole azure vault! Yet, if you take the telescope, it brings into your sight a new host of stars that escape the naked eye. Here they seem contiguous and minute, but to a nearer view immense orbs of fight at various distances, far sunk in the abyss of space. Now you must call imagination to your aid. The feeble narrow sense cannot descry innumerable worlds revolving round the central fires; and in those worlds the energy of an all-perfect Mind displayed in endless forms. But, neither sense nor imagination are big enough to comprehend the boundless extent, with all its glittering furniture. Though the labouring mind exert and strain each power to its utmost reach, there still stands out ungrasped a surplusage immeasurable. Yet all the vast bodies that compose this mighty frame, how distant and remote soever, are by some secret mechanism, some Divine art and force, linked in a mutual dependence and intercourse with each other; even with this earth, which was almost slipt from my thoughts and lost in the crowd of worlds. Is not the whole system immense, beautiful, glorious beyond expression and beyond thought! What treatment, then, do those philosophers deserve, who would deprive these noble and delightful scenes of all <reality>? How should those Principles be entertained that lead us to think all the visible beauty of the creation a false imaginary glare? To be plain, can you expect this Scepticism of yours will not be thought extravagantly absurd by all men of sense?

<Hyl>. Other men may think as they please; but for your part you have nothing to reproach me with. My comfort is, you are as much a sceptic as I am.

<Phil>. There, Hylas, I must beg leave to differ from you.

<Hyl>. What! Have you all along agreed to the premises, and do you now deny the conclusion, and leave me to maintain those paradoxes by myself which you led me into? This surely is not fair.

<Phil>. <I> deny that I agreed with you in those notions that led to Scepticism. You indeed said the <reality> of sensible things consisted in <an absolute existence out of the minds of spirits>, or distinct from their being perceived. And pursuant to this notion of reality, <you> are obliged to deny sensible things any {212} real existence: that is, according to your own definition, you profess yourself a sceptic. But I neither said nor thought the reality of sensible things was to be defined after that manner. To me it is evident for the reasons you allow of, that sensible things cannot exist otherwise than in a mind or spirit. Whence I conclude, not that they have no real existence, but that., seeing they depend not on my thought, and have all existence distinct from being perceived by me, <there must be some other Mind wherein they exist>. As sure, therefore, as the sensible world really exists, so sure is there an infinite omnipresent Spirit who contains and supports it.

<Hyl>. What! This is no more than I and all Christians hold; nay, and all others too who believe there is a God, and that He knows and comprehends all things.

<Phil>. Aye, but here lies the difference. Men commonly believe that all things are known or perceived by God, because they believe the being of a God; whereas I, on the other side, immediately and necessarily conclude the being of a God, because

all sensible things must be perceived by Him.

<Hyl>. But, so long as we all believe the same thing, what matter is it how we come by that belief?

<Phil>. But neither do we agree in the same opinion. For philosophers, though they acknowledge all corporeal beings to be perceived by God, yet they attribute to them an absolute subsistence distinct from their being perceived by any mind whatever; which I do not. Besides, is there no difference between saying, <There is a God>, <therefore He perceives all things>; and saying, <Sensible things do really exist>; <and>, <if they really exist>, <they are necessarily perceived by an infinite Mind>: <therefore there is an infinite Mind or God>? This furnishes you with a direct and immediate demonstration, from a most evident principle, of the <being of a God>. Divines and philosophers had proved beyond all controversy, from the beauty and usefulness of the several parts of the creation, that it was the workmanship of God. But that -- setting aside all help of astronomy and natural philosophy, all contemplation of the contrivance, order, and adjustment of things -- an infinite Mind should be necessarily inferred from the bare <existence of the sensible world>, is an advantage to them only who have made this easy reflexion: that the sensible world is that which we perceive by our several senses; and that nothing is perceived by the senses beside ideas; and that no {213} idea or archetype of an idea can exist otherwise than in a mind. You may now, without any laborious search into the sciences, without any subtlety of reason, or tedious length of discourse, oppose and baffle the most strenuous advocate for Atheism. Those miserable refuges, whether in an eternal succession of unthinking causes and effects, or in a fortuitous concourse of atoms; those wild imaginations of Vanini, Hobbes, and Spinoza: in a word, the whole system of Atheism, is it not entirely overthrown, by this single reflexion on the repugnancy included in supposing the whole, or any part, even the most rude and shapeless, of the visible world, to exist without a mind? Let any one of those abettors of impiety but look into his own thoughts, and there try if he can conceive how so much as a rock, a desert, a chaos, or confused jumble of atoms; how anything at all, either sensible or imaginable, can exist independent of a Mind, and he need go no farther to be convinced of his folly. Can anything be fairer than to put a dispute on such an issue, and leave it to a man himself to see if he can conceive, even in thought, what he holds to be true in fact, and from a notional to allow it a real existence?

<Hyl>. It cannot be denied there is something highly serviceable to religion in what you advance. But do you not think it looks very like a notion entertained by some eminent moderns, of <seeing all things in God>?

<Phil>. I would gladly know that opinion: pray explain it to me.

<Hyl>. They conceive that the soul, being immaterial, is incapable of being united with material things, so as to perceive them in themselves; but that she perceives them by her union with the substance of God, which, being spiritual, is therefore purely intelligible, or capable of being the immediate object of a spirit's thought. Besides the Divine essence contains in it perfections correspondent to each created being; and which are,

for that reason, proper to exhibit or represent them to the mind.

<Phil>. I do not understand how our ideas, which are things altogether passive and inert, can be the essence, or any part (or like any part) of the essence or substance of God, who is an {214} impassive, indivisible, pure, active being. Many more difficulties and objections there are which occur at first view against this hypothesis; but I shall only add that it is liable to all the absurdities of the common hypothesis, in making a created world exist otherwise than in the mind of a Spirit. Besides all which it hath this peculiar to itself; that it makes that material world serve to no purpose. And, if it pass for a good argument against other hypotheses in the sciences, that they suppose Nature, or the Divine wisdom, to make something in vain, or do that by tedious roundabout methods which might have been performed in a much more easy and compendious way, what shall we think of that hypothesis which supposes the whole world made in vain?

<Hyl>. But what say you? Are not you too of opinion that we see all things in God? If I mistake not, what you advance comes near it.

<Phil>. [Few men think; yet all have opinions. Hence men's opinions are superficial and confused. It is nothing strange that tenets which in themselves are ever so different, should nevertheless be confounded with each other, by those who do not consider them attentively. I shall not therefore be surprised if some men imagine that I run into the enthusiasm of Malebranche; though in truth I am very remote from it. He builds on the most abstract general ideas, which I entirely disclaim. He asserts an absolute external world, which I deny. He maintains that we are deceived by our senses, and, know not the real natures or the true forms and figures of extended beings; of all which I hold the direct contrary. So that upon the whole there are no Principles more fundamentally opposite than his and mine. It must be owned that][5] I entirely agree with what the holy Scripture saith, "That in God we live and move and have our being." But that we see things in His essence, after the manner above set forth, I am far from believing. Take here in brief my meaning: -- It is evident that the things I perceive are my own ideas, and that no idea can exist unless it be in a mind: nor is it less plain that these ideas or things by me perceived, either themselves or their archetypes, exist independently of my mind, since I know myself not to be their author, it being out of my power to determine at pleasure what particular ideas I shall be affected with upon opening my eyes or ears: they must therefore exist in some other Mind, whose {215} Will it is they should be exhibited to me. The things, I say, immediately perceived are ideas or sensations, call them which you will. But how can any idea or sensation exist in, or be produced by, anything but a mind or spirit? This indeed is inconceivable. And to assert that which is inconceivable is to talk nonsense: is it not?

<Hyl>. Without doubt.

<Phil>. But, on the other hand, it is very conceivable that they should exist in and be produced by a spirit; since this is no more than I daily experience in myself, inasmuch as I perceive numberless ideas; and, by an act of my will, can form a great variety of them, and raise them up in my imagination: though, it

must be confessed, these creatures of the fancy are not altogether so distinct, so strong, vivid, and permanent, as those perceived by my senses -- which latter are called <red things>. From all which I conclude, <there is a Mind which affects me every moment with all the sensible impressions I perceive>. <And>, from the variety, order, and manner of these, I conclude <the Author of them to be wise>, <powerful>, <and good>, <beyond comprehension>. <Mark> it well; I do not say, I see things by perceiving that which represents them in the intelligible Substance of God. This I do not understand; but I say, the things by me perceived are known by the understanding, and produced by the will of an infinite Spirit. And is not all this most plain and evident? Is there any more in it than what a little observation in our own minds, and that which passeth in them, not only enables us to conceive, but also obliges us to acknowledge.

<Hyl>. I think I understand you very clearly; and own the proof you give of a Deity seems no less evident than it is surprising. But, allowing that God is the supreme and universal Cause of an things, yet, may there not be still a Third Nature besides Spirits and Ideas? May we not admit a subordinate and limited cause of our ideas? In a word, may there not for all that be <Matter>?

<Phil>. How often must I inculcate the same thing? You allow the things immediately perceived by sense to exist nowhere without the mind; but there is nothing perceived by sense which is not perceived immediately: therefore there is nothing sensible that exists without the mind. The Matter, therefore, which you still insist on is something intelligible, I suppose; something that may be discovered by reason, and not by sense.

<Hyl>. You are in the right. {216}

<Phil>. Pray let me know what reasoning your belief of Matter is grounded on; and what this Matter is, in your present sense of it.

<Hyl>. I find myself affected with various ideas, whereof I know I am not the cause; neither are they the cause of themselves, or of one another, or capable of subsisting by themselves, as being altogether inactive, fleeting, dependent beings. They have therefore <some> cause distinct from me and them: of which I pretend to know no more than that it is <the cause of my ideas>. And this thing, whatever it be, I call Matter.

<Phil>. Tell me, Hylas, hath every one a liberty to change the current proper signification attached to a common name in any language? For example, suppose a traveller should tell you that in a certain country men pass unhurt through the fire; and, upon explaining himself, you found he meant by the word fire that which others call <water>. Or, if he should assert that there are trees that walk upon two legs, meaning men by the term <trees>. Would you think this reasonable?

<Hyl>. No; I should think it very absurd. Common custom is the standard of propriety in language. And for any man to affect speaking improperly is to pervert the use of speech, and can never serve to a better purpose than to protract and multiply disputes, where there is no difference in opinion.

<Phil>. And doth not <Matter>, in the common current acceptation of the word, signify an extended, solid, moveable, unthinking, inactive Substance?

<Hyl>. It doth.

<Phil>. And, hath it not been made evident that no <such> substance can possibly exist? And, though it should be allowed to exist, yet how can that which is <inactive> be a <cause>; or that which is <unthinking> be a <cause of thought>? You may, indeed, if you please, annex to the word <Matter> a contrary meaning to what is vulgarly received; and tell me you understand by it, an unextended, thinking, active being, which is the cause of our ideas. But what else is this than to play with words, and run into that very fault you just now condemned with so much reason? I do by no means find fault with your reasoning, in that you collect a cause from the <phenomena>: <but> I deny that <the> cause deducible by reason can properly be termed Matter.

<Hyl>. There is indeed something in what you say. But I am {217} afraid you do not thoroughly comprehend my meaning. I would by no means be thought to deny that God, or an infinite Spirit, is the Supreme Cause of all things. All I contend for is, that, subordinate to the Supreme Agent, there is a cause of a limited and inferior nature, which <concurs> in the production of our ideas, not by any act of will, or spiritual efficiency, but by that kind of action which belongs to Matter, viz. <motion>.

<Phil>. I find you are at every turn relapsing into your old exploded conceit, of a moveable, and consequently an extended, substance, existing without the mind. What! Have you already forgotten you were convinced; or are you willing I should repeat what has been said on that head? In truth this is not fair dealing in you, still to suppose the being of that which you have so often acknowledged to have no being. But, not to insist farther on what has been so largely handled, I ask whether all your ideas are not perfectly passive and inert, including nothing of action in them.

<Hyl>. They are.

<Phil>. And are sensible qualities anything else but ideas?

<Hyl>. How often have I acknowledged that they are not.

<Phil>. But is not <motion> a sensible quality?

<Hyl>. It is.

<Phil>. Consequently it is no action?

<Hyl>. I agree with you. And indeed it is very plain that when I stir my finger, it remains passive; but my will which produced the motion is active.

<Phil>. Now, I desire to know, in the first place, whether, motion being allowed to be no action, you can conceive any action besides volition: and, in the second place, whether to say something and conceive nothing be not to talk nonsense: and, lastly, whether, having considered the premises, you do not

perceive that to suppose any efficient or active Cause of our ideas, other than <Spirit>, is highly absurd and unreasonable?

<Hyl>. I give up the point entirely. But, though Matter may not be a cause, yet what hinders its being an <instrument>, subservient to the supreme Agent in the production of our ideas?

<Phil>. An instrument say you; pray what may be the figure, springs, wheels, and motions, of that instrument?

<Hyl>. Those I pretend to determine nothing of, both the substance and its qualities being entirely unknown to me.

<Phil>. What? You are then of opinion it is made up of {218} unknown parts, that it hath unknown motions, and an unknown shape?

<Hyl>. I do not believe that it hath any figure or motion at all, being already convinced, that no sensible qualities can exist in an unperceiving substance.

<Phil>. But what notion is it possible to frame of an instrument void of all sensible qualities, even extension itself?

<Hyl>. I do not pretend to have any notion of it.

<Phil>. And what reason have you to think this unknown, this inconceivable Somewhat doth exist? Is it that you imagine God cannot act as well without it; or that you find by experience the use of some such thing, when you form ideas in your own mind?

<Hyl>. You are always teasing me for reasons of my belief. Pray what reasons have you not to believe it?

<Phil>. It is to me a sufficient reason not to believe the existence of anything, if I see no reason for believing it. But, not to insist on reasons for believing, you will not so much as let me know <what it is> you would have me believe; since you say you have no manner of notion of it. After all, let me entreat you to consider whether it be like a philosopher, or even like a man of common sense, to pretend to believe you know not what ' and you know not why.

<Hyl>. Hold, Philonous. When I tell you Matter is an <instrument>, I do not mean altogether nothing. It is true I know not the particular kind of instrument; but, however, I have some notion of <instrument in general>, which I apply to it.

<Phil>. But what if it should prove that there is something, even in the most general notion of <instrument>, as taken in a distinct sense from <cause>, which makes the use of it inconsistent with the Divine attributes?

<Hyl>. Make that appear and I shall give up the point.

<Phil>. What mean you by the general nature or notion of <instrument>?

<Hyl>. That which is common to all particular instruments composeth the general notion.

<Phil>. Is it not common to all instruments, that they are applied to the doing those things only which cannot be performed by the mere act of our wills? Thus, for instance, I never use an instrument to move my finger, because it is done by a volition. But I should use one if I were to remove part of a rock, or tear up a tree by the roots. Are you of the same mind? {219} Or, can you shew any example where an instrument is made use of in producing an effect <immediately> depending on the will of the agent?

<Hyl>. I own I cannot.

<Phil>. How therefore can you suppose that an All-perfect Spirit, on whose Will all things have an absolute and immediate dependence, should need an instrument in his operations, or, not needing it, make use of it? Thus it seems to me that you are obliged to own the use of a lifeless inactive instrument to be incompatible with the infinite perfection of God; that is, by your own confession, to give up the point.

<Hyl>. It doth not readily occur what I can answer you.

<Phil>. But, methinks you should be ready to own the truth, when it has been fairly proved to you. We indeed, who are beings of finite powers, are forced to make use of instruments. And the use of an instrument sheweth the agent to be limited by rules of another's prescription, and that he cannot obtain his end but in such a way, and by such conditions. Whence it seems a clear consequence, that the supreme unlimited agent useth no tool or instrument at all. The will of an Omnipotent Spirit is no sooner exerted than executed, without the application of means; which, if they are employed by inferior agents, it is not upon account of any real efficacy that is in them, or necessary aptitude to produce any effect, but merely in compliance with the laws of nature, or those conditions prescribed to them by the First Cause, who is Himself above all limitation or prescription whatsoever.

<Hyl>. I will no longer maintain that Matter is an instrument. However, I would not be understood to give up its existence neither; since, notwithstanding what hath been said, it may still be an <occasion>.

<Phil>. How many shapes is your Matter to take? Or, how often must it be proved not to exist, before you are content to part with it? But, to say no more of this (though by all the laws of disputation I may justly blame you for so frequently changing the signification of the principal term) -- I would fain know what you mean by affirming that matter is an occasion, having already denied it to be a cause. And, when you have shewn in what sense you understand <occasion>, pray, in the next place, be pleased to shew me what reason induceth you to believe there is such an occasion of our ideas?

<Hyl>. As to the first point: by <occasion> I mean an inactive {220} unthinking being, at the presence whereof God excites ideas in our minds.

<Phil>. And what may be the nature of that inactive unthinking being?

<Hyl>. I know nothing of its nature.

<Phil>. Proceed then to the second point, and assign some reason why we should allow an existence to this inactive, unthinking, unknown thing.

<Hyl>. When we see ideas produced in our minds, after an orderly and constant manner, it is natural to think they have some fixed and regular occasions, at the presence of which they are excited.

<Phil>. You acknowledge then God alone to be the cause of our ideas, and that He causes them at the presence of those occasions.

<Hyl>. That is my opinion.

<Phil>. Those things which you say are present to God, without doubt He perceives.

<Hyl>. Certainly; otherwise they could not be to Him an occasion of acting.

<Phil>. Not to insist now on your making sense of this hypothesis, or answering all the puzzling questions and difficulties it is liable to: I only ask whether the order and regularity observable in the series of our ideas, or the course of nature, be not sufficiently accounted for by the wisdom and power of God; and whether it doth not derogate from those attributes, to suppose He is influenced, directed, or put in mind, when and what He is to act, by an unthinking substance? And, lastly, whether, in case I granted all you contend for, it would make anything to your purpose; it not being easy to conceive how the external or absolute existence of an unthinking substance, distinct from its being perceived, can be inferred from my allowing that there are certain things perceived by the mind of God, which are to Him the occasion of producing ideas in us?

<Hyl>. I am perfectly at a loss what to think, this notion of <occasion> seeming now altogether as groundless as the rest.

<Phil>. Do you not at length perceive that in all these different acceptations of <Matter>, you have been only supposing you know not what, for no manner of reason, and to no kind of use?

<Hyl>. I freely own myself less fond of my notions since they have been so accurately examined. But still, methinks, I have some confused perception that there is such a thing as <Matter>. {221}

<Phil>. Either you perceive the being of Matter immediately or mediately. If immediately, pray inform me by which of the senses you perceive it. If mediately, let me know by what reasoning it is inferred from those things which you perceive immediately. So much for the perception. Then for the Matter itself, I ask whether it is object, <substratum>, cause, instrument, or occasion? You have already pleaded for each of these, shifting your notions, and making Matter to appear sometimes in one shape, then in another. And what you have

offered hath been disapproved and rejected by yourself. If you have anything new to advance I would gladly bear it.

<Hyl>. I think I have already offered all I had to say on those heads. I am at a loss what more to urge.

<Phil>. And yet you are loath to part with your old prejudice. But, to make you quit it more easily, I desire that, beside what has been hitherto suggested, you will farther consider whether, upon. supposition that Matter exists, you can possibly conceive how you should be affected by it. Or, supposing it did not exist, whether it be not evident you might for all that be affected with the same ideas you now are, and consequently have the very same reasons to believe its existence that you now can have.

<Hyl>. I acknowledge it is possible we might perceive all things just as we do now, though there was no Matter in the world; neither can I conceive, if there be Matter, how it should produce' any idea in our minds. And, I do farther grant you have entirely satisfied me that it is impossible there should be such a thing as matter in any of the foregoing acceptations. But still I cannot help supposing that there is <Matter> in some sense or other. <What that is I> do not indeed pretend to determine.

<Phil>. I do not expect you should define exactly the nature of that unknown being. Only be pleased to tell me whether it is a Substance; and if so, whether you can suppose a Substance without accidents; or, in case you suppose it to have accidents or qualities, I desire you will let me know what those qualities are, at least what is meant by Matter's supporting them?

<Hyl>. We have already argued on those points. I have no more to say to them. But, to prevent any farther questions, let me tell you I at present understand by <Matter> neither substance nor accident, thinking nor extended being, neither cause, instrument, nor occasion, but Something entirely unknown, distinct from all these. {222}

<Phil>. It seems then you include in your present notion of Matter nothing but the general abstract idea of <entity>.

<Hyl>. Nothing else; save only that I super-add to this general idea the negation of all those particular things, qualities, or ideas, that I perceive, imagine, or in anywise apprehend.

<Phil>. Pray where do you suppose this unknown Matter to exist?

<Hyl>. Oh Philonous! now you think you have entangled me; for, if I say it exists in place, then you will infer that it exists in the mind, since it is agreed that place or extension exists only in the mind. But I am not ashamed to own my ignorance. I know not where it exists; only I am sure it exists not in place. There is a negative answer for you. And you must expect no other to all the questions you put for the future about Matter.

<Phil>. Since you will not tell me where it exists, be pleased to inform me after what manner you suppose it to exist,

or what you mean by its <existence>?

<Hyl>. It neither thinks nor acts, neither perceives nor is perceived.

<Phil>. But what is there positive in your abstracted notion of its existence?

<Hyl>. Upon a nice observation, I do not find I have any positive notion or meaning at all. I tell you again, I am not ashamed to own my ignorance. I know not what is meant by its <existence>, or how it exists.

<Phil>. Continue, good Hylas, to act the same ingenuous part, and tell me sincerely whether you can frame a distinct idea of Entity in general, prescinded from and exclusive of all thinking and corporeal beings, all particular things whatsoever.

<Hyl>. Hold, let me think a little -- I profess, Philonous, I do not find that I can. At first glance, methought I had some dilute and airy notion of Pure Entity in abstract; but, upon closer attention, it hath quite vanished out of sight. The more I think on it, the more am I confirmed in my prudent resolution of giving none but negative answers, and not pretending to the least degree of any positive knowledge or conception of Matter, its <where>, its <how>, its <entity>, or anything belonging to it.

<Phil>. When, therefore, you speak of the existence of Matter, you have not any notion in your mind?

<Hyl>. None at all.

<Phil>. Pray tell me if the case stands not thus -- At first, from a belief of material substance, you would have it that the {223} immediate objects existed without the mind; then that they are archetypes; then causes; next instruments; then occasions: lastly <something in general>, which being interpreted proves <nothing>. So Matter comes to nothing. What think you, Hylas, is not this a fair summary of your whole proceeding?

<Hyl>. Be that as it will, yet I still insist upon it, that our not being able to conceive a thing is no argument against its existence.

<Phil>. That from a cause, effect, operation, sign, or other circumstance, there may reasonably be inferred the existence of a thing not immediately perceived; and that it were absurd for any man to argue against the existence of that thing, from his having no direct and positive notion of it, I freely own. But, where there is nothing of all this; where neither reason nor revelation induces us to believe the existence of a thing; where we have not even a relative notion of it; where an abstraction is made from perceiving and being perceived, from Spirit and idea: lastly, where there is not so much as the most inadequate or faint idea pretended to -- I will not indeed thence conclude against the reality of any notion, or existence of anything; but my inference shall be, that you mean nothing at all; that you employ words to no manner of purpose, without any design or signification whatsoever. And I leave it to you to consider how mere jargon should be treated.

<Hyl>. To deal frankly with you, Philonous, your arguments seem in themselves unanswerable; but they have not so great an effect on me as to produce that entire conviction, that hearty acquiescence, which attends demonstration. I find myself relapsing into an obscure surmise of I know not what, <matter>.

<Phil>. But, are you not sensible, Hylas, that two things must concur to take away all scruple, and work a plenary assent in the mind,? Let a visible object be set in never so clear a light, yet, if there is any imperfection in the sight, or if the eye is not directed towards it, it will not be distinctly seen. And though a demonstration be never so well grounded and fairly proposed, yet, if there is withal a stain of prejudice, or a wrong bias on the understanding, can it be expected on a sudden to perceive clearly, and adhere firmly to the truth? No; there is need of time and pains: the attention must be awakened and detained by a frequent repetition of the same thing placed oft in the same, oft in different lights. I have said it already, and find I must still repeat and inculcate, that it is an unaccountable licence {224} you take, in pretending to maintain you know not what, for you know not what reason, to you know not what purpose. Can this be paralleled in any art or science, any sect or profession of men? Or is there anything so barefacedly groundless and unreasonable to be met with even in the lowest of common conversation? But, perhaps you will still say, Matter may exist; though at the same time you neither know <what is meant> by <Matter>, or by its <existence>. This indeed is surprising, and the more so because it is altogether voluntary [and of your own head],[6] you not being led to it by any one reason; for I challenge you to shew me that thing in nature which needs Matter to explain or account for it.

<Hyl>. <The reality> of things cannot be maintained without supposing the existence of Matter. And is not this, think you, a good reason why I should be earnest in its defence?

<Phil>. The reality of things! What things? sensible or intelligible?

<Hyl>. Sensible things.

<Phil>. My glove for example?

<Hyl>. That, or any other thing perceived by the senses.

<Phil>. But to fix on some particular thing. Is it not a sufficient evidence to me of the existence of this <glove>, that I see it, and feel it, and wear it? Or, if this will not do, how is it possible I should be assured of the reality of this thing, which I actually see in this place, by supposing that some unknown thing, which I never did or can see, exists after an unknown manner, in an unknown place, or in no place at all? How can the supposed reality of that which is intangible be a proof that anything tangible really exists? Or, of that which is invisible, that any visible thing, or, in general of anything which is imperceptible, that a perceptible exists? Do but explain this and I shall think nothing too hard for you.

<Hyl>. Upon the whole, I am content to own the existence of matter is highly improbable; but the direct and absolute impossibility of it does not appear to me.

<Phil>. But granting Matter to be possible, yet, upon that account merely, it can have no more claim to existence than a golden mountain, or a centaur.

<Hyl>. I acknowledge it; but still you do not deny it is possible; and that which is possible, for aught you know, may actually exist.

<Phil>. I deny it to be possible; and have, if I mistake not, {225} evidently proved, from your own concessions, that it is not. In the common sense of the word <Matter>, is there any more implied than an extended, solid, figured, moveable substance, existing without the mind? And have not you acknowledged, over and over, that you have seen evident reason for denying the possibility of such a substance?

<Hyl>. True, but that is only one sense of the term <Matter>.

<Phil>. But is it not the only proper genuine received sense? And, if Matter, in such a sense, be proved impossible, may it not be thought with good grounds absolutely impossible? Else how could anything be proved impossible? Or, indeed, how could there be any proof at all one way or other, to a man who takes the liberty to unsettle and change the common signification of words?

<Hyl>. I thought philosophers might be allowed to speak more accurately than the vulgar, and were not always confined to the common acceptation of a term.

<Phil>. But this now mentioned is the common received sense among philosophers themselves. But, not to insist on that, have you not been allowed to take Matter in what sense you pleased? And have you not used this privilege in the utmost extent; sometimes entirely changing, at others leaving out, or putting into the definition of it whatever, for the present, best served your design, contrary to all the known rules of reason and logic? And hath not this shifting, unfair method of yours spun out our dispute to an unnecessary length; Matter having been particularly examined, and by your own confession refuted in each of those senses? And can any more be required to prove the absolute impossibility of a thing, than the proving it impossible in every particular sense that either you or any one else understands it in?

<Hyl>. But I am not so thoroughly satisfied that you have proved the impossibility of Matter, in the last most obscure abstracted and indefinite sense.

<Phil>.. When is a thing shewn to be impossible?

<Hyl>. When a repugnancy is demonstrated between the ideas comprehended in its definition.

<Phil>. But where there are no ideas, there no repugnancy can be demonstrated between ideas?

<Hyl>. I agree with you.

<Phil>. Now, in that which you call the obscure indefinite sense of the word <Matter>, it is plain, by your own confession, there {226} was included no idea at all, no sense except an unknown sense; which is the same thing as none. You are not, therefore, to expect I should prove a repugnancy between ideas, where there are no ideas; or the impossibility of Matter taken in an <unknown> sense, that is, no sense at all. My business was only to shew you meant <nothing>; and this you were brought to own. So that, in all your various senses, you have been shewed either to mean nothing at all, or, if anything, an absurdity. And if this be not sufficient to prove the impossibility of a thing, I desire you will let me know what is.

<Hyl>. I acknowledge you have proved that Matter is impossible; nor do I see what more can be said in defence of it. But, at the same time that I give up this, I suspect all my other notions. For surely none could be more seemingly evident than this once was: and yet it now seems as false and absurd as ever it did true before. But I think we have discussed the point sufficiently for the present. The remaining part of the day I would willingly spend in running over in my thoughts the several heads of this morning's conversation, and tomorrow shall be glad to meet you here again about the same time.

<Phil>. <I> will not fail to attend you. {227}

THE THIRD DIALOGUE

<Philonous.> Tell me, Hylas,[7] what are the fruits of yesterday's meditation? Has it confirmed you in the same mind you were in at parting? or have you since seen cause to change your opinion?

<Hylas>. Truly my opinion is that all our opinions are alike vain and uncertain. What we approve to-day, we condemn to-morrow. We keep a stir about knowledge, and spend our lives in the pursuit of it, when, alas I we know nothing all the while: nor do I think it possible for us ever to know anything in this life. Our faculties are too narrow and too few. Nature certainly never intended us for speculation.

<Phil>. What! Say you we can know nothing, Hylas?

<Hyl>. There is not that single thing in the world whereof we can know the real nature, or what it is in itself.

<Phil>. Will you tell me I do not really know what fire or water is?

<Hyl>. You may indeed know that fire appears hot, and water fluid; but this is no more than knowing what sensations are produced in your own mind, upon the application of fire and water to your organs of sense. Their internal constitution, their true and real nature, you are utterly in the dark as to <that>.

<Phil>. Do I not know this to be a real stone that I stand on, and that which I see before my eyes to be a real tree?

<Hyl>. <Know>? No, it is impossible you or any man alive should know it. All you know is, that you have such a certain idea or appearance in your own mind. But what is this to the real

tree or stone? I tell you that colour, figure, and hardness, which you perceive, are not the real natures of those things, or in the least like them. The same may be said of all other real things, or corporeal substances, which compose the world. They have none of them anything of themselves, like those sensible qualities by us perceived. We should not therefore pretend to affirm or know anything of them, as they are in their own nature.

<Phil>. But surely, Hylas, I can distinguish gold, for example, {228} from iron: and how could this be, if I knew not what either truly was?

<Hyl>. Believe me, Philonous, you can only distinguish between your own ideas. That yellowness, that weight, and other sensible qualities, think you they are really in the gold? They are only relative to the senses, and have no absolute existence in nature. And in pretending to distinguish the species of real things, by the appearances in your mind, you may perhaps act as wisely as he that should conclude two men were of a different species, because their clothes were not of the same colour.

<Phil>. It seems, then, we are altogether put off with the appearances of things, and those false ones too. The very meat I eat, and the cloth I wear, have nothing in them like what I see and feel.

<Hyl>. Even so.

<Phil>. But is it not strange the whole world should be thus imposed on, and so foolish as to believe their senses? And yet I know not how it is, but men eat, and drink, and sleep, and perform all the offices of life, as comfortably and conveniently as if they really knew the things they are conversant about.

<Hyl>. They do so: but you know ordinary practice does not require a nicety of speculative knowledge. Hence the vulgar retain their mistakes, and for all that make a shift to bustle through the affairs of life. But philosophers know better things.

<Phil>. You mean, they <know> that they <know nothing>.

<Hyl>. That is the very top and perfection of human knowledge.

<Phil>. But are you all this while in earnest, Hylas; and are you seriously persuaded that you know nothing real in the world? Suppose you are going to write, would you not call for pen, ink, and paper, like another man; and do you not know what it is you call for?

<Hyl>. How often must I tell you, that I know not the real nature of any one thing in the universe? I may indeed upon occasion make use of pen, ink, and paper. But what any one of them is in its own true nature, I declare positively I know not. And the same is true with regard to every, other corporeal thing. And, what is more, we are not only ignorant of the true and real nature of things, but even of their existence. It cannot be denied that we perceive such certain appearances or ideas; but it cannot be concluded from thence that bodies really exist. {229} Nay, now I think on it, I must, agreeably to my former concessions, farther declare that it is impossible any <real>

corporeal thing should exist in nature.

<Phil>. You amaze me. Was ever anything more wild and extravagant than the notions you now maintain: and is it not evident you are led into all these extravagances by the belief of <material substance>? This makes you dream of those unknown natures in everything. It is this occasions your distinguishing between the reality and sensible appearances of things. It is to this you are indebted for being ignorant of what everybody else knows perfectly well. Nor is this all: you are not only ignorant of the true nature of everything, but you know not whether anything really exists, or whether there are any true natures at all; forasmuch as you attribute to your material beings an absolute or external existence, wherein you suppose their reality consists. And, as you are forced in the end to acknowledge such an existence means either a direct repugnancy, or nothing at all, it follows that you are obliged to pull down your own hypothesis of material Substance, and positively to deny the real existence of any part of the universe. And so you are plunged into the deepest and most deplorable scepticism that ever man was. Tell me, Hylas, is it not as I say?

<Hyl>. I agree with you. <Material substance> was no more than an hypothesis; and a false and groundless one too. I will no longer spend my breath in defence of it. But whatever hypothesis you advance, or whatsoever scheme of things you introduce in its stead, I doubt not it will appear every whit as false: let me but be allowed to question you upon it. That is, suffer me to serve you in your own kind, and I warrant it shall conduct you through as many perplexities and contradictions, to the very same state of scepticism that I myself am in at present.

<Phil>. I assure you, Hylas, I do not pretend to frame any hypothesis at all. I am of a vulgar cast, simple enough to believe my senses, and leave things as I find them. To be plain, it is my opinion that the real things are those very things I see, and feel, and perceive by my senses. These I know; and, finding they answer all the necessities and purposes of life, have no reason to be solicitous about any other unknown beings. A piece of sensible bread, for instance, would stay my stomach better than ten thousand times as much of that insensible, unintelligible, real bread you speak of. It is likewise my opinion that colours and other sensible qualities are on the {230} objects. I cannot for my life help thinking that snow is white, and fire hot. You indeed, who by <snow> and fire mean certain external, unperceived, unperceiving substances, are in the right to deny whiteness or heat to be affections inherent in <them>. But I, who understand by those words the things I see and feel, am obliged to think like other folks. And, as I am no sceptic with regard to the nature of things, so neither am I as to their existence. That a thing should be really perceived by my senses, and at the same time not really exist, is to me a plain contradiction; since I cannot prescind or abstract, even in thought, the existence of a sensible thing from its being perceived. Wood, stones, fire, water, flesh, iron, and the like things, which I name and discourse of, are things that I know. And I should not have known them but that I perceived them by my senses; and things perceived by the senses are immediately perceived; and things immediately perceived are ideas; and ideas cannot exist without the mind; their existence therefore consists in being perceived; when, therefore, they are actually perceived

there can be no doubt of their existence. Away then with all that scepticism, all those ridiculous philosophical doubts. What a jest is it for a philosopher to question the existence of sensible things, till he hath it proved to him from the veracity of God; or to pretend our knowledge in this point falls short of intuition or demonstration! I might as well doubt of my own being, as of the being of those things I actually see and feel.

<Hyl>. Not so fast, Philonous: you say you cannot conceive how sensible things should exist without the mind. Do you not?

<Phil>. I do.

<Hyl>. Supposing you were annihilated, cannot you conceive it possible that things perceivable by sense may still exist?

<Phil>. <I> can; but then it must be in another mind. When I deny sensible things an existence out of the mind, I do not mean my mind in particular, but all minds. Now, it is plain they have an existence exterior to my mind; since I find them by experience to be independent of it. There is therefore some other Mind wherein they exist, during the intervals between the times of {231} my perceiving them: as likewise they did before my birth, and would do after my supposed annihilation. And, as the same is true with regard to all other finite created spirits, it necessarily follows there is an <omnipresent eternal Mind>, which knows and comprehends all things, and exhibits them to our view in such a manner, and according to such rules, as He Himself hath ordained, and are by us termed the <laws of nature>.

<Hyl>. Answer me, Philonous. Are all our ideas perfectly inert beings? Or have they any agency included in them?

<Phil>. They are altogether passive and inert.

<Hyl>. And is not God an agent, a being purely active?

<Phil>. I acknowledge it.

<Hyl>. No idea therefore can be like unto, or represent the nature of God?

<Phil>. It cannot.

<Hyl>. Since therefore you have no <idea> of the mind of God, how can you conceive it possible that things should exist in His mind? Or, if you can conceive the mind of God, without having an idea of it, why may not I be allowed to conceive the existence of Matter, notwithstanding I have no idea of it?

<Phil>. As to your first question: I own I have properly no <idea>, either of God or any other spirit; for these being active, cannot be represented by things perfectly inert, as our ideas are. I do nevertheless know that 1, who am a spirit or thinking substance, exist as certainly a s I know my ideas exist. Farther, I know what I mean by the terms I <and myself>; and I know this immediately or intuitively, though I do not perceive it as I perceive a triangle, a colour, or a sound. The Mind, Spirit, or Soul is that indivisible unextended thing which thinks, acts, and perceives. I say <indivisible>, because unextended; and <unextended>, because extended, figured, moveable things are

ideas; and that which perceives ideas, which thinks and wills, is plainly itself no idea, nor like an idea. Ideas are things inactive, and perceived. And Spirits a sort of beings altogether different from them. I do not therefore say my soul is an idea, or like an idea. However, taking the word <idea> in a large sense, my soul may be said to furnish me with an idea, that is, an image or likeness of God -- though indeed extremely inadequate. For, all the notion I have of God is obtained by reflecting on my own soul, heightening its powers, and removing its {232} imperfections. I have, therefore, though not an inactive idea, yet in <myself> some sort of an active thinking image of the Deity. And, though I perceive Him not by sense, yet I have a notion of Him, or know Him by reflexion and reasoning. My own mind and my own ideas I have an immediate knowledge of; and, by the help of these, do mediately apprehend the possibility of the existence of other spirits and ideas. Farther, from my own being, and from the dependency I find in myself and my ideas, I do, by an act of reason, necessarily infer the existence of a God, and of all created things in the mind of God. So much for your first question. For the second: I suppose by this time you can answer it yourself. For you neither perceive Matter objectively, as you do an inactive being or idea; nor know it, as you do yourself, by a reflex act, neither do you mediately apprehend it by similitude of the one or the other; nor yet collect it by reasoning from that which you know immediately. All which makes the case of <Matter> widely different from that of the <Deity>.

[<Hyl>. You say your own soul supplies you with some sort of an idea or image of God. But, at the same time, you acknowledge you have, properly speaking, no <idea> of your own soul. You even affirm that spirits are a sort of beings altogether different from ideas. Consequently that no idea can be like a spirit. We have therefore no idea of any spirit. You admit nevertheless that there is spiritual Substance, although you have no idea of it; while you deny there can be such a thing as material Substance, because you have no notion or idea of it. Is this fair dealing? To act consistently, you must either admit Matter or reject Spirit. What say you to this?

<Phil>. <I> say, in the first place, that I do not deny the existence of material substance, merely because I have no notion of it' but because the notion of it is inconsistent; or, in other words, because it is repugnant that there should be a notion of it. Many things, for aught I know, may exist, whereof neither I nor any other man hath or can have any idea or notion whatsoever. But then those things must be possible, that is, nothing {233} inconsistent must be included in their definition. I say, secondly, that, although we believe things to exist which we do not perceive, yet we may not believe that any particular thing exists, without some reason for such belief: but I have no reason for believing the existence of Matter. I have no immediate intuition thereof: neither can I immediately from my sensations, ideas, notions, actions, or passions, infer an unthinking, unperceiving, inactive Substance -- either by probable deduction, or necessary consequence. Whereas the being of my Self, that is, my own soul, mind, or thinking principle, I evidently know by reflexion. You will forgive me if I repeat the same things in answer to the same objections. In the very notion or definition of <material Substance>, there is included a manifest repugnance and inconsistency. But this cannot be said of the notion of

Spirit. That ideas should exist in what doth not perceive, or be produced by what doth not act, is repugnant. But, it is no repugnancy to say that a perceiving thing should be the subject of ideas, or an active thing the cause of them. It is granted we have neither an immediate evidence nor a demonstrative knowledge of the existence of other finite spirits; but it will not thence follow that such spirits are on a foot with material substances: if to suppose the one be inconsistent, and it be not inconsistent to suppose the other; if the one can be inferred by no argument, and there is a probability for the other; if we see signs and effects indicating distinct finite agents like ourselves, and see no sign or symptom whatever that leads to a rational belief of Matter. I say, lastly, that I have a notion of Spirit, though I have not, strictly speaking, an idea of it. I do not perceive it as an idea, or by means of an idea, but know it by reflexion.

<Hyl>. Notwithstanding all you have said, to me it seems that, according to your own way of thinking, and in consequence of your own principles, it should follow that <you> are only a system of floating ideas, without any substance to support them. Words are not to be used without a meaning. And, as there is no more meaning in <spiritual Substance> than in <material Substance>, the one is to be exploded as well as the other.

<Phil>. How often must I repeat, that I know or am conscious of my own being; and that <I myself> am not my ideas, but somewhat else, a thinking, active principle that perceives, knows, wifls, and operates about ideas. I know that I, one {234} and the same self, perceive both colours and sounds: that a colour cannot perceive a sound, nor a sound a colour: that I am therefore one individual principle, distinct from colour and sound; and, for the same reason, from aft other sensible things and inert ideas. But, I am not in like manner conscious either of the existence or essence of Matter. On the contrary, I know that nothing inconsistent can exist, and that the existence of Matter implies an inconsistency. Farther, I know what I mean when I affirm that there is a spiritual substance or support of ideas, that is, that a spirit knows and perceives ideas. But, I do not know what is meant when it is said that an unperceiving substance hath inherent in it and supports either ideas or the archetypes of ideas. There is therefore upon the whole no parity of case between Spirit and Matter.][8]

<Hyl>. I own myself satisfied in this point. But, do you in earnest think the real existence of sensible things consists in their being actually perceived? If so; how comes it that all mankind distinguish between them? Ask the first man you meet, and he shall tell you, <to be perceived> is one thing, and <to exist> is another.

<Phil>. <I> am content, Hylas, to appeal to the common sense of the world for the truth of my notion. Ask the gardener why he thinks yonder cherry-tree exists in the garden, and he shall tell you, because he sees and feels it; in a word, because he perceives it by his senses. Ask him why he thinks an orange-tree not to be there, and he shall tell you, because he does not perceive it. What he perceives by sense, that he terms a real, being, and saith it <is or exists>; but, that which is not perceivable, the same, he saith, hath no being.

<Hyl>. Yes, Philonous, I grant the existence of a sensible

thing consists in being perceivable, but not in being actually perceived.

<Phil>. And what is perceivable but an idea? And can an idea exist without being actually perceived? These are points long since agreed between us.

<Hyl>. But, be your opinion never so true, yet surely you will not deny it is shocking, and contrary to the common sense of men. {235} Ask the fellow whether yonder tree hath an existence out of his mind: what answer think you he would make?

<Phil>. The same that I should myself, to wit, that it doth exist out of his mind. But then to a Christian it cannot surely be shocking to say, the real tree, existing without his mind, is truly known and comprehended by (that is <exists in>) the infinite mind of God. Probably he may not at first glance be aware of the direct and immediate proof there is of this; inasmuch as the very being of a tree, or any other sensible thing, implies a mind wherein it is. But the point itself he cannot deny. The question between the Materialists and me is not, whether things have a <real> existence out of the mind of this or that person, but whether they have an <absolute> existence, distinct from being perceived by God, and exterior to all minds. This indeed some heathens and philosophers have affirmed, but whoever entertains notions of the Deity suitable to the Holy Scriptures will be of another opinion.

<Hyl>. But, according to your notions, what difference is there between real things, and chimeras formed by the imagination, or the visions of a dream -- since they are all equally in the mind?

<Phil>. The ideas formed by the imagination are faint and indistinct; they have, besides, an entire dependence on the will. But the ideas perceived by sense, that is, real things, are more vivid and clear; and, being imprinted on the mind by a spirit distinct from us, have not the like dependence on our will. There is therefore no danger of confounding these with the foregoing: and there is as little of confounding them with the visions of a dream, which are dim, irregular, and confused. And, though they should happen to be never so lively and natural, yet, by their not being connected, and of a piece with the preceding and subsequent transactions of our lives, they might easily be distinguished from realities. In short, by whatever method you distinguish <things from chimeras> on your scheme, the same, it is evident, will hold also upon mine. For, it must be, I presume, by some perceived difference; and I am not for depriving you of any one thing that you perceive.

<Hyl>. But still, Philonous, you hold, there is nothing in the world but spirits and ideas. And this, you must needs acknowledge, sounds very oddly.

<Phil>. I own the word <idea>, not being commonly used for <thing>, sounds something out of the way. My reason for using it was, because a necessary relation to the mind is understood to {236} be implied by that term; and it is now commonly used by philosophers to denote the immediate objects of the understanding. But, however oddly the proposition may sound in words, yet it includes nothing so very strange or shocking in its

sense; which in effect amounts to no more than this, to wit, that there are only things perceiving, and things perceived; or that every unthinking being is necessarily, and from -the very nature of its existence, perceived by some mind; if not by a finite created mind, yet certainly by the infinite mind of God, in whom "we five, and move, and have our being." Is this as strange as to say, the sensible qualities are not on the objects: or that we cannot be sure of the existence of things, or know any thing of their real natures -- though we both see and feel them, and perceive them by all our senses?

<Hyl>. And, in consequence of this, must we not think there are no such things as physical or corporeal causes; but that a Spirit is the immediate cause of all the phenomena in nature? Can there be anything more extravagant than this?

<Phil>. Yes, it is infinitely more extravagant to say -- a thing which is inert operates on the mind, and which is unperceiving is the cause of our perceptions, [without any regard either to consistency, or the old known axiom, <Nothing can give to another that which it hath not itself>].[9] Besides, that which to you, I know not for what reason, seems so extravagant is no more than the Holy Scriptures assert in a hundred places. In them God is represented as the sole and immediate Author of all those effects which some heathens and philosophers are wont to ascribe to Nature, Matter, Fate, or the like unthinking principle. This is so much the constant language of Scripture that it were needless to confirm it by citations.

<Hyl>. You are not aware, Philonous, that in making God the immediate Author of all the motions in nature, you make Him the Author of murder, sacrilege, adultery, and the like heinous sins.

<Phil>. In answer to that, I observe, first, that the imputation of guilt is the same, whether a person commits an action with or without an instrument. In case therefore you suppose God to act by the mediation of an instrument or occasion, called <Matter>, you as truly make Him the author of sin as I, who think Him the immediate agent in all those operations vulgarly ascribed to Nature. I farther observe that sin or moral turpitude {237} doth not consist in the outward physical action or motion, but in the internal deviation of the will from the laws of reason and religion. This is plain, in that the killing an enemy in a battle, or putting a criminal legally to death, is not thought sinful; though the outward act be the very same with that in the case of murder. Since, therefore, sin doth not consist in the physical action, the making God an immediate cause of all such actions is not making Him the Author of sin. Lastly, I have nowhere said that God is the only agent who produces all the motions in bodies. It is true I have denied there are any other agents besides spirits; but this is very consistent with allowing to thinking rational beings, in the production of motions, the use of limited powers, ultimately indeed derived from God, but immediately under the direction of their own wills, which is sufficient to entitle them to all the guilt of their actions.

<Hyl>. But the denying Matter, Philonous, or corporeal Substance; there is the point. You can never persuade me that this is not repugnant to the universal sense of mankind. Were our dispute to be determined by most voices, I am confident you would

give up the point, without gathering the votes.

<Phil>. I wish both our opinions were fairly stated and submitted to the judgment of men who had plain common sense, without the prejudices of a learned education. Let me be represented as one who trusts his senses, who thinks he knows the things he sees and feels, and entertains no doubts of their existence; and you fairly set forth with all your doubts, your paradoxes, and your scepticism about you, and I shall willingly acquiesce in the determination of any indifferent person. That there is no substance wherein ideas can exist beside spirit is to me evident. And that the objects immediately perceived are ideas, is on all hands agreed. And that sensible qualities are objects immediately perceived no one can deny. It is therefore evident there can be no <substratum> of those qualities but spirit; in which they exist, not by way of mode or property, but as a thing perceived in that which perceives it. I deny therefore that there is <any unthinking>-<substratum> of the objects of sense, and <in that acceptation> that there is any material substance. But if by <material substance> is meant only <sensible body>, <that> which is seen and felt (and the unphilosophical part of the world, I dare say, mean no more) -- then I am more certain of matter's existence than you or any other philosopher pretend to be. If there be anything which makes ,die generality of mankind {238} averse from the notions I espouse, it is a misapprehension that I deny the reality of sensible things. But, as it is you who are guilty of that, and not 1, it follows that in truth their aversion is against your notions and not mine. I do therefore assert that I am as certain as of my own being, that there are bodies or corporeal substances (meaning the things I perceive by my senses); and that, granting this, the bulk of mankind will take no thought about, nor think themselves at all concerned in the fate of those unknown natures, and philosophical quiddities, which some men are so fond of.

<Hyl>. What say you to this? Since, according to you, men judge of the reality of things by their senses, how can a man be mistaken in thinking the moon a plain lucid surface, about a foot in diameter; or a square tower, seen at a distance, round; or an oar, with one end in the water, crooked?

<Phil>. He is not mistaken with regard to the ideas he actually perceives, but in the inference he makes from his present perceptions. Thus, in the case of the oar, what he immediately perceives by sight is certainly crooked; and so far he is in the right. But if he thence conclude that upon taking the oar out of the water he shall perceive the same crookedness; or that it would affect his touch as crooked things are wont to do: in that he is mistaken. In like manner, if he shall conclude from what he perceives in one station, that, in case he advances towards the moon or tower, he should still be affected with the like ideas, he is mistaken. But his mistake lies not in what he perceives immediately, and at present, (it being a manifest contradiction to suppose he should err in respect of that) but in the wrong judgment he makes concerning the ideas he apprehends to be connected with those immediately perceived: or, concerning the ideas that, from what he perceives at present, he imagines would be perceived in other circumstances. The case is the same with regard to the Copernican system. We do not here perceive any motion of the earth: but it were erroneous thence to conclude, that, in case we were placed at as great a distance from that as

we are now from the other planets, we should not then perceive its motion.

<Hyl>. I understand you; and must needs own you say things plausible enough. But, give me leave to put you in mind of {239} one thing. Pray, Philonous, were you not formerly as positive that Matter existed, as you are now that it does not?

<Phil>. I was. But here lies the difference. Before, my positiveness was founded, without examination, upon prejudice; but now, after inquiry, upon evidence.

<Hyl>. After all, it seems our dispute is rather about words than things. We agree in the thing, but differ in the name. That we are affected with ideas <from without> is evident; and it is no less evident that there must be (I will not say archetypes, but) Powers without the mind, corresponding to those ideas. And, as these Powers cannot subsist by themselves, there is some subject of them necessarily to be admitted; which I call <Matter>, and you call <Spirit>. This is all the difference.

<Phil>. Pray, Hylas, is that powerful Being, or subject of powers, extended?

<Hyl>. It hath not extension; but it hath the power to raise in you the idea of extension.

<Phil>. It is therefore itself unextended?

<Hyl>. I grant it.

<Phil>. Is it not also active?

<Hyl>. Without doubt. Otherwise, how could we attribute powers to it?

<Phil>. Now let me ask you two questions: <First>, Whether it be agreeable to the usage either of philosophers or others to give the name <Matter> to an unextended active being? And, <Secondly>, Whether it be not ridiculously absurd to misapply names contrary to the common use of language?

<Hyl>. Well then, let it not be called Matter, since you will have it so, but some <Third Nature> distinct from Matter and Spirit. For what reason is there why you should call it Spirit? Does not the notion of spirit imply that it is thinking, as well as active and unextended?

<Phil>. My reason is this: because I have a mind to have some notion of meaning in what I say: but I have no notion of any action distinct from volition, neither. can I conceive volition to be anywhere but in a spirit: therefore, when I speak of an active being, I am obliged to mean a Spirit. Beside, what can be plainer than that a thing which hath no ideas in itself cannot impart them to me; and, if it hath ideas, surely it must be a Spirit. To make you comprehend the point still more {240} clearly if it be possible, I assert as well as you that, since we are affected from without, we must allow Powers to be without, in a Being distinct from ourselves. So far we are agreed. But then we differ as to the kind of this powerful Being. I will have it to be Spirit, you Matter, or I know not what (I may add too, you

know not what) Third Nature. Thus, I prove it to be Spirit. From the effects I see produced, I conclude there are actions; and, because actions, volitions; and, because there are volitions, there must be a <will>. Again, the things I perceive must have an existence, they or their archetypes, out of <my> mind: but, being ideas, neither they nor their archetypes can exist otherwise than in an understanding; there is therefore an <understanding>. But will and understanding constitute in the strictest sense a mind or spirit. The powerful cause, therefore, of my ideas is in strict propriety of speech a <Spirit>.

<Hyl>. And now I warrant you think you have made the point very clear, little suspecting that what you advance leads directly to a contradiction. Is it not an absurdity to imagine any imperfection in God?

<Phil>. Without a doubt.

<Hyl>. To suffer pain is an imperfection?

<Phil>. It is.

<Hyl>. Are we not sometimes affected with pain and uneasiness by some other Being?

<Phil>. We are.

<Hyl>. And have you not said that Being is a Spirit, and is not that Spirit God?

<Phil>. I grant it.

<Hyl>. But you have asserted that whatever ideas we perceive from without are in the mind which affects us. The ideas, therefore, of pain and uneasiness are in God; or, in other words, God suffers pain: that is to say, there is an imperfection in the Divine nature: which, you acknowledged, was absurd. So you are caught in a plain contradiction.

<Phil>. That God knows or understands all things, and that He knows, among other things, what pain is, even every sort of painful sensation, and what it is for His creatures to suffer pain, I make no question. But, that God, though He knows and sometimes causes painful sensations in us, can Himself suffer pain, I positively deny. We, who are limited and dependent spirits, are liable to impressions of sense, the effects of an {241} external Agent, which, being produced against our wills, are sometimes painful and uneasy. But God, whom no external being can affect, who perceives nothing by sense as we do; whose will is absolute and independent, causing all things, and liable to be thwarted or resisted by nothing: it is evident, such a Being as this can suffer nothing, nor be affected with any painful sensation, or indeed any sensation at all. We are chained to a body: that is to say, our perceptions are connected with corporeal motions. By the law of our nature, we are affected upon every alteration in the nervous parts of our sensible body; which sensible body, rightly considered, is nothing but a complexion of such qualities or ideas as have no existence distinct from being perceived by a mind. So that this connexion of sensations with corporeal motions means no more than a correspondence in the order of nature, between two sets of ideas, or things immediately

perceivable. But God is a Pure Spirit, disengaged from all such sympathy, or natural ties. No corporeal motions are attended with the sensations of pain or pleasure in His mind. To know everything knowable, is certainly a perfection; but to endure, or suffer, or feel anything by sense, is an imperfection. The former, I say, agrees to God, but not the latter. God knows, or hath ideas; but His ideas are not conveyed to Him by sense, as ours are. Your not distinguishing, where there is so manifest a difference, makes you fancy you see an absurdity where there is none.

<Hyl>. But, all this while you have not considered that the quantity of Matter has been demonstrated to be proportioned to the gravity of bodies. And what can withstand demonstration?

<Phil>. Let me see how you demonstrate that point.

<Hyl>. I lay it down for a principle, that the moments or quantities of motion in bodies are in a direct compounded reason of the velocities and quantities of Matter contained in them. Hence, where the velocities are equal, it follows the moments are directly as the quantity of Matter in each. But it is found by experience that all bodies (bating the small inequalities, arising from the resistance of the air) descend with an equal velocity; the motion therefore of descending bodies, and consequently their gravity, which is the cause or principle of that motion, is proportional to the quantity of Matter; which was to be demonstrated.

<Phil>. You lay it down as a self-evident principle that the quantity of motion in any body is proportional to the velocity {242} and <Matter> taken together; and this is made use of to prove a proposition from whence the existence of <Carter> is inferred. Pray is not this arguing in a circle?

<Hyl>. In the premise I only mean that the motion is proportional to the velocity, jointly with the extension and solidity.

<Phil>. But, allowing this to be true, yet it will not thence follow that gravity is proportional to <Matter>, in your philosophic sense of the word; except you take it for granted that unknown <substratum>, or whatever else you call it, is proportional to those sensible qualities; which to suppose is plainly begging the question. That there is magnitude and solidity, or resistance, perceived by sense, I readily grant; as likewise, that gravity may be proportional to those qualities I will not dispute. But that either these qualities as perceived by us, or the powers producing them, do exist in a <material substratum>; this is what I deny, and you indeed affirm, but, notwithstanding your demonstration, have not yet proved.

<Hyl>. I shall insist no longer on that point. Do you think, however, you shall persuade me that the natural philosophers have been dreaming all this while? Pray what becomes of all their hypotheses and explications of the phenomena, which suppose the existence of Matter?

<Phil>. What mean you, Hylas, by the <phenomena>?

<Hyl>. I mean the appearances which I perceive by my senses.

<Phil>. And the appearances perceived by sense, are they not ideas?

<Hyl>. I have told you so a hundred times.

<Phil>. Therefore, to explain the phenomena, is, to shew how we come to be affected with ideas, in that manner and order wherein they are imprinted on our senses. Is it not?

<Hyl>. It is.

<Phil>. Now, if you can prove that any philosopher has explained the production of any one idea in our minds by the help of <Matter>, I shall for ever acquiesce, and look on all that hath been said against it as nothing; but, if you cannot, it is vain to urge the explication of phenomena. That a Being endowed with knowledge and will should produce or exhibit ideas is easily understood. But that a Being which is utterly destitute of these faculties should be able to produce ideas, or in any sort to affect an intelligence, this I can never understand. This I say, though {243} we had some positive conception of Matter, though we knew its qualities, and could comprehend its existence, would yet be so far from explaining things, that it is itself the most inexplicable thing in the world. And yet, for all this, it will not follow that philosophers have been doing nothing; for, by observing and reasoning upon the connexion of ideas, they discover the laws and methods of nature, which is a part of knowledge both useful and entertaining.

<Hyl>. After all, can it be supposed God would deceive all mankind? Do you imagine He would have induced the whole world to believe the being of Matter, if there was no such thing?

<Phil>. That every epidemical opinion, arising from prejudice, or passion, or thoughtlessness, may be imputed to God, as the Author of it, I believe you will not affirm. Whatsoever opinion we father ' on Him, it must be either because He has discovered it to us by supernatural revelation; or because it is so evident to our natural faculties, which were framed and given us by God, that it is impossible we should withhold our assent from it. But where is the revelation? or where is the evidence that extorts the belief of Matter? Nay, how does it appear, that Matter, <taken for something distinct from what we perceive by our senses>, is thought to exist by all mankind; or indeed, by any except a few philosophers, who do not know what they would be at? Your question supposes these points are clear; and, when you have cleared them, I shall think myself obliged to give you another answer. In the meantime, let it suffice that I tell you, I do not suppose God has deceived mankind at all.

<Hyl>. But the novelty, Philonous, the novelty! There lies the danger. New notions should always be discountenanced; they unsettle men's minds, and nobody knows where they will end.

<Phil>. Why the rejecting a notion that has no foundation, either in sense, or in reason, or in Divine authority, should be thought to unsettle the belief of such opinions as are grounded on all or any of these, I cannot imagine. That innovations in government and religion are dangerous, and ought to be discountenanced, I freely own. But is there the like reason why

they should be discouraged in philosophy? The making anything known which was unknown before is an innovation in knowledge: and, if all such innovations had been forbidden, {244} men would have made a notable progress in the arts and sciences. But it is none of my business to plead for novelties and paradoxes. That the qualities we perceive are not on the objects: that we must not believe our senses: that we know nothing of the real nature of things, and can never be assured even of their existence: that real colours and sounds are nothing but certain unknown figures and motions: that motions are in themselves neither swift nor slow: that there are in bodies absolute extensions, without any particular magnitude or figure: that a thing stupid, thoughtless, and inactive, operates on a spirit: that the least particle of a body contains innumerable extended parts: -- these are the novelties, these are the strange notions which shock the genuine uncorrupted judgment of all mankind; and being once admitted, embarrass the mind with endless doubts and difficulties. And it is against these and the like innovations I endeavour to vindicate Common Sense. It is true, in doing this, I may perhaps be obliged to use some <ambages>, and ways of speech not common. But, if my notions are once thoroughly understood, that which is most singular in them will, in effect, be found to amount to no more than this. -- that it is absolutely impossible, and a plain contradiction, to suppose any unthinking Being should exist without being perceived by a Mind. And, if this notion be singular, it is a shame it should be so, at this time of day, and in a Christian country.

<Hyl>. As for the difficulties other opinions may be liable to,. those are out of the question. It is your business to defend your own opinion. Can anything be plainer than that you are for changing all things into ideas? You, I say, who are not ashamed to charge me <with scepticism>. This is so plain, there is no denying it.

<Phil>. You mistake me. I am not for changing things into ideas, but rather ideas into things; since those immediate objects of perception, which, according to you, are only appearances of things, I take to be the real things themselves.

<Hyl>. Things! You may pretend what you please; but it is certain you leave us nothing but the empty forms of things, the outside only which strikes the senses.

<Phil>. What you call the empty forms and outside of things seem to me the very things themselves. Nor are they empty or incomplete, otherwise than upon your supposition -- that Matter {245} is an essential part of all corporeal things. We both, therefore, agree in this, that we perceive only sensible forms: but herein we differ -- you will have them to be empty appearances, I, real beings. In short, you do not trust your senses, I do.

<Hyl>. You say you believe your senses; and seem to applaud yourself that in this you agree with the vulgar. According to you, therefore, the true nature of a thing is discovered by the senses. If so, whence comes that disagreement? Why is not the same figure, and other sensible qualities, perceived all manner of ways? and why should we use a microscope the better to discover the true nature of a body, if it were discoverable to the naked eye?

<Phil>. Strictly speaking, Hylas, we do not see the same object that we feel; neither is the same object perceived by the microscope which was by the naked eye. But, in case every variation was thought sufficient to constitute a new kind of individual, the endless number of confusion of names would render language impracticable. Therefore, to avoid this, as well as other inconveniences which are obvious upon a little thought, men combine together several ideas, apprehended by divers senses, or by the same sense at different times, or in different circumstances, but observed, however, to have some connexion in nature, either with respect to co-existence or succession; all which they refer to one name, and consider as one thing. Hence it follows that when I examine, by my other senses, a thing I have seen, it is not in order to understand better the same object which I had perceived by sight, the object of one sense not being perceived by the other senses. And, when I look through a microscope, it is not that I may perceive more clearly what I perceived already with my bare eyes; the object perceived by the glass being quite different from the former. But, in both cases, my aim is only to know what ideas are connected together; and the more a man knows of the connexion of ideas, the more he is said to know of the nature of things. What, therefore, if our ideas are variable; what if our senses are not in all circumstances affected with the same appearances. It will not thence follow they are not to be trusted; or that they are inconsistent either with themselves or anything else: except it be with your preconceived notion of (I know not what) one single, unchanged, unperceivable, real Nature, marked by each name. Which prejudice seems to have taken its rise from not rightly {246} understanding the common language of men, speaking of several distinct ideas as united into one thing by the mind. And, indeed, there is cause to suspect several erroneous conceits of the philosophers are owing to the same original: while they began to build their schemes not so much on notions as on words, which were framed by the vulgar, merely for conveniency and dispatch in the common actions of life, without any regard to speculation.

<Hyl>. Methinks I apprehend your meaning.

<Phil>. It is your opinion the ideas we perceive by our senses are not real things, but images or copies of them. Our knowledge, therefore, is no farther real than as our ideas are the true <representations> of those <originals>. But, as these supposed originals are in themselves unknown, it is impossible to know how far our ideas resemble them; or whether they resemble them at all. We cannot, therefore, be sure we have any real knowledge. Farther, as our ideas are perpetually varied, without any change in the supposed real things, it necessarily follows they cannot all be true copies of them: or, if some are and others are not, it is impossible to distinguish the former from the latter. And this plunges us yet deeper in uncertainty. Again, when we consider the point, we cannot conceive how any idea, or anything like an idea, should have an absolute existence out of a mind: nor consequently, according to you, how there should be any real thing in nature. The result of ;all which is that we are thrown into the most hopeless and abandoned scepticism. Now, give me leave to ask you, First, Whether your referring ideas to certain absolutely existing unperceived substances, as their originals, be not the source of all this scepticism? Secondly, whether you are informed, either by sense or reason, of the

existence of those unknown originals? And, in case you are not, whether it be not absurd to suppose them? Thirdly, Whether, upon inquiry, you find there is anything distinctly conceived or meant by the <absolute or external existence of unperceiving substances>? Lastly, Whether, the premises considered, it be not the wisest way to follow nature, trust your senses, and, laying aside all anxious thought about unknown natures or substances, admit with the vulgar those for real things which are perceived by the senses?

<Hyl>. For the present, I have no inclination to the answering part. I would much rather see how you can get over what follows. Pray are not the objects perceived by the {247} <senses> of one, likewise perceivable to others present? If there were a hundred more here, they would all see the garden, the trees, and flowers, as I see them. But they are not in the same manner affected with the ideas I frame in my <imagination>. Does not this make a difference between the former sort of objects and the latter?

<Phil>. I grant it does. Nor have I ever denied a difference between the objects of sense and those of imagination. But what would you infer from thence? You cannot say that sensible objects exist unperceived, because they are perceived by many.

<Hyl>. I own I can make nothing of that objection: but it hath led me into another. Is it not your opinion that by our senses we perceive only the ideas existing in our minds?

<Phil>. It is.

<Hyl>. But the <same> idea which is in my mind cannot be in yours, or in any other mind. Doth it not therefore follow, from your principles, that no two can see the same thing? And is not this highly, absurd?

<Phil>. If the term <same> be taken in the vulgar acceptation, it is certain (and not at all repugnant to the principles I maintain) that different persons may perceive the same thing; or the same thing or idea exist in different minds. Words are of arbitrary imposition; and, since men are used to apply the word <same> where no distinction or variety is perceived, and I do not pretend to alter their perceptions, it follows that, as men have said before, <several saw the same thing>, so they may, upon like occasions, still continue to use the same phrase, without any deviation either from propriety of language, or the truth of things. But, if the term <same> be used in the acceptation of philosophers, who pretend to an abstracted notion of identity, then, according to their sundry definitions of this notion (for it is not yet agreed wherein that philosophic identity consists), it may or may not be possible for divers persons to perceive the same thing. But whether philosophers shall think fit to <call> a thing the <same or> no, is, I conceive, of small importance. Let us suppose several men together, all endued with the same faculties, and consequently affected in like sort by their senses, and who had yet never known the use of language; they would, without question, agree in their perceptions. Though perhaps, when they came to the use of speech, some regarding the uniformness of what was perceived, might call it the <same> thing: others, especially {248} regarding the diversity of persons who perceived, might choose

the denomination of <different> things. But who sees not that all the dispute is about a word? to wit, whether. what is perceived by different persons may yet have the term <same> applied to it? Or, suppose a house, whose walls or outward shell remaining unaltered, the chambers are all pulled down, and new ones built in their place; and that you should call this the <same>, and I should say it was not the <same> house. -- would we not, for all this, perfectly agree in our thoughts of the house, considered in itself? And would not all the difference consist in a sound? If you should say, We differed in our notions; for that you super-added to your idea of the house the simple abstracted idea of identity, whereas I did not; I would tell you, I know not what you mean by <the abstracted idea of identity>; and should desire you to look into your own thoughts, and be sure you understood yourself. -- Why so silent, Hylas? Are you not yet satisfied men may dispute about identity and diversity, without any real difference in their thoughts and opinions, abstracted from names? Take this farther reflexion with you: that whether Matter be allowed to exist or no, the case is exactly the same as to the point in hand. For the Materialists themselves acknowledge what we immediately perceive by our senses to be our own ideas. Your difficulty, therefore, that no two see the same thing, makes equally against the Materialists and me.

<Hyl>. [Ay, Philonous,][10] But they suppose an external archetype, to which referring their several ideas they may truly be said to perceive the same thing.

<Phil>. And (not to mention your having discarded those archetypes) so may you suppose an external archetype on my principles; -- <external>, <I mean>, <to your own mind>: though indeed it must be' supposed to exist in that Mind which comprehends all things; but then, this serves all the ends of <identity>, as well as if it existed out of a mind. And I am sure you yourself will not say it is less intelligible.

<Hyl>. You have indeed clearly satisfied me -- either that there is no difficulty at bottom in this point; or, if there be, that it makes equally against both opinions.

<Phil>. But that which makes equally against two contradictory opinions can be a proof against neither.

<Hyl>. I acknowledge it. But, after all, Philonous, when I consider {249} the substance of what you advance against <Scepticism>, it amounts to no more than this: We are sure that we really see, hear, feel; in a word, that we are affected with sensible impressions.

<Phil>. And how are <we> concerned any farther? I see this cherry, I feel it, I taste it: and I am sure <nothing> cannot be seen, or felt, or. tasted: it is therefore red. Take away the sensations of softness, moisture, redness, tartness, and you take away the cherry, since it is not a being distinct from sensations. A cherry, I say, is nothing but a congeries of sensible impressions, or ideas perceived by various senses: which ideas are united into one thing (or have one name given them) by the mind, because they are observed to attend each other. Thus, when the palate is affected with such a particular taste, the sight is affected with a red colour, the touch with roundness, softness, &c. Hence, when I see, and feel, and taste, in such

sundry certain manners, I am sure the cherry exists, or is real; its reality being in my opinion nothing abstracted from those sensations. But if by the word <cherry> you, mean an unknown nature, distinct from all those sensible qualities, and by its <existence> something distinct from its being perceived; then, indeed, I own, neither you nor I, nor any one else, can be sure it exists.

<Hyl>. But, what would you say, Philonous, if I should bring the very same reasons against the existence of sensible things <in a mind>, which you have offered against their existing <in a material substratum>?

<Phil>. When I see your reasons, you shall hear what I have to say ,to them.

<Hyl>. Is the mind extended or unextended?

<Phil>. Unextended, without doubt.

<Hyl>. Do you say the things you perceive are in your mind?

<Phil>. They are.

<Hyl>. Again, have I not heard you speak of sensible impressions?

<Phil>. I believe you may.

<Hyl>. Explain to me now, 0 Philonous! how it is possible there should be room for all those trees and houses to exist in your mind. Can extended things be contained in that which is unextended? Or, are we to imagine impressions made on a thing void of all solidity? You cannot say objects are in your mind, as books in your study: or that things are imprinted on it, as the figure of a seal upon wax. In what sense, therefore, are we to understand those expressions? Explain me this if you can: and I shall then be able to answer all those queries you formerly put to me about my <substratum>.

<Phil>. Look you, Hylas, when I speak of objects as existing in the mind, or imprinted on the senses, I would not be understood in the gross literal sense; as when bodies are said to exist in a place, or a seal to make an impression upon wax. My meaning is only that the mind comprehends or perceives them; and that it is affected from without, or by some being distinct from itself. This is my explication of your difficulty; and how it can serve to make your tenet of an unperceiving material <substratum> intelligible, I would fain know.

<Hyl>. Nay, if that be all, I confess I do not see what use can be made of it. But are you not guilty of some abuse of language in this?

<Phil>. None at all. It is no more than common custom, which you know is the rule of language, hath authorised: nothing being more usual, than for philosophers to speak of the immediate objects of the understanding as things existing in the mind. 'Nor is there anything in this but what is conformable to the general analogy of language; most part of the mental operations being signified by words borrowed from sensible things; as is plain in

the terms <comprehend>, reflect, <discourse>, &<c>., which, being applied to the mind, must not be taken in their gross, original sense.

<Hyl>. You have, I own, satisfied me in this point. But there still remains one great difficulty, which I know not how you will get over. And, indeed, it is of such importance that if you could solve all others, without being able to find a solution for this, you must never expect to make me a proselyte to your principles.

<Phil>. Let me know this mighty difficulty.

<Hyl>. The Scripture account of the creation is what appears to me utterly irreconcilable with your notions. Moses tells us of a creation: a creation of what? of ideas? No, certainly, but of things, of real things, solid corporeal substances. Bring your principles to agree with this, and I shall perhaps agree with you.

<Phil>. Moses mentions the sun, moon, and stars, earth and sea, plants and animals. That all these do really exist, and were in the beginning created by God, I make no question. {251} If by <ideas> you mean fictions and fancies of the mind, then these are no ideas. If by <ideas> you mean immediate objects of the understanding, or sensible things, which cannot exist unperceived, or out of a mind, then these things are ideas. But whether you do or do not call them <ideas>, <it> matters little. The difference is only about a name. And, whether that name be retained or rejected, the sense, the truth, and reality of things continues the same. In common talk, the objects of our senses are not termed <ideas>, but <things>. Call them so still: provided you do not attribute to them any absolute external existence, and I shall never quarrel with you for a word. The creation, therefore, I allow to have been a creation of things, of <red> things. Neither is this in the least inconsistent with my principles, as is evident from what I have now said; and would have been evident to you without this, if you had not forgotten what had been so often said before. But as for solid corporeal substances, I desire you to show where Moses makes any mention of them; and, if they should be mentioned by him, or any other inspired writer, it would still be incumbent on you to shew those words were not taken in the vulgar acceptation, for things falling under our senses, but in the philosophic acceptation, for Matter, or <an unknown quiddity>, <with an absolute existence>. When you have proved these points, then (and not till then) may you bring the authority of Moses into our dispute.

<Hyl>. It is in vain to dispute about a point so clear. I am content to refer it to your own conscience. Are you not satisfied there is some peculiar repugnancy between the Mosaic account of the creation and your notions?

<Phil>. If all possible sense which can be put on the first chapter of Genesis may be conceived as consistently with my principles as any other, then it has no peculiar repugnancy with them. But there is no sense you may not as well conceive, believing as I do. Since, besides spirits, all you conceive are ideas; and the existence of these I do not deny. Neither do you pretend they exist without the mind.

<Hyl>. Pray let me see any sense you can understand it in.

<Phil>. Why, I imagine that if I had been present at the creation, I should have seen things produced into being -- that is become perceptible -- in the order prescribed by the sacred historian. I ever before believed the Mosaic account of the creation, and now find no alteration in my manner of believing it. When things are said to begin or end their existence, we {252} do not mean this with regard to God, but His creatures. All objects are eternally known by God, or, which is the same thing, have an eternal existence in His mind: but when things, before imperceptible to creatures, are, by a decree of God, perceptible to them, then are they said to begin a relative existence, with respect to created minds. Upon reading therefore the Mosaic account of the creation, I understand that the several parts of the world became gradually perceivable to finite spirits, endowed with proper faculties; so that, whoever such were present, they were in truth perceived by them. This is the literal obvious sense suggested to me by the words of the Holy Scripture: in which is included no mention, or no thought, either of <substratum>, <instrument, occasion, or absolute existence. And, upon inquiry, I doubt not it will be found that most plain honest men, who believe the creation, never think of those things any more than I. What metaphysical sense you may understand it in, you only can tell.

<Hyl>. But, Philonous, you do not seem to be aware that you allow created things, in the beginning, only a relative, and consequently hypothetical being: that is to say, upon supposition there were <men> to perceive them; without which they have no actuality of absolute existence, wherein creation might terminate. Is it not, therefore, according to you, plainly impossible the creation of any inanimate creatures should precede that of man? And is not this directly contrary to the Mosaic account?

<Phil>. In answer to that, I say, first, created beings might begin to exist in the mind of other created intelligences, beside men. You will not therefore be able to prove any contradiction between Moses and my notions, unless you first shew there was no other order of finite created spirits in being, before man. I say farther, in case we conceive the creation, as we should at this time, a parcel of plants or vegetables of all sorts produced, by an invisible Power, in a desert where nobody was present -- that this way of explaining or conceiving it is consistent with my principles, since they deprive you of nothing, either sensible or imaginable; that it exactly suits with the common, natural, and undebauched notions of mankind; that it manifests the dependence of all things on God; and consequently hath all the good effect or influence, which it is possible that important article of our faith should have in making men humble, thankful, and resigned to their [great][11] Creator. I say, moreover, that, in this naked {253} conception of things, divested of words, there will not be found any notion of what you call the <actuality of absolute existence>. You may indeed raise a dust with those terms, and so lengthen our dispute to no purpose. But I entreat you calmly to look into your own thoughts, and then tell me if they are not a useless and unintelligible jargon.

<Hyl>. I own I have no very clear notion annexed to them.

But what say you to this? Do you not make the existence of sensible things consist in their being in a mind? And were not all things eternally in the mind of God? Did they not therefore exist from all eternity, according to you? And how could that which was eternal be created in time? Can anything be clearer or better connected than this?

<Phil>. And are not you too of opinion, that God knew all things from eternity?

<Hyl>. I am.

<Phil>. Consequently they always had a being in the Divine intellect.

<Hyl>. This I acknowledge.

<Phil>. By your own confession, therefore, nothing is new, or begins to be, in respect of the mind of God. So we are agreed in that point.

<Hyl>. What shall we make then of the creation?

<Phil>. May we not understand it to have been entirely in respect of finite spirits; so that things, with regard to us, may properly be said to begin their existence, or be created, when God decreed they should become perceptible to intelligent creatures, in that order and manner which He then established, and we now call the laws of nature? You may call this a <relative>, <or hypothetical existence> if you please. But, so long as it supplies us with the most natural, obvious, and literal sense of the Mosaic history of the creation; so long as it answers all the religious ends of that great article; in a word, so long as you can assign no other sense or meaning in its stead; why should we reject this? Is it to comply with a ridiculous sceptical humour of making everything nonsense and unintelligible? I am sure you cannot say it is for the glory of God. For, allowing it to be a thing possible and conceivable that the corporeal world should have an absolute existence extrinsical to the mind of God, as well as to the minds of all created spirits; yet how could this set forth either the immensity or omniscience of the Deity, or the necessary and immediate dependence of all {254} things on Him? Nay, would it not rather seem to derogate from those attributes?

<Hyl>. Well, but as to this decree of God's, for making things perceptible, what say you, Philonous? Is it not plain, God did either execute that decree from all eternity, or at some certain time began to will what He had not actually willed before, but only designed to will? If the former, then there could be no creation, or beginning of existence, in finite things. If the latter, then we must acknowledge something new to befall the Deity; which implies a sort of change: and all change argues imperfection.

<Phil>. Pray consider what you are doing. Is it not evident this objection concludes equally against a creation in any sense; nay, against every other act of the Deity, discoverable by the light of nature? None of which can <we> conceive, otherwise than as performed in time, and having a beginning. God is a Being of transcerident and unlimited perfections: His nature, therefore,

is incomprehensible to finite spirits. It is not, therefore, to be expected, that any man, whether Materialist or Immaterialist, should have exactly just notions of the Deity, His attributes, and ways of operation. If then you would infer anything against me, your difficulty must not be drawn from the inadequateness of our conceptions of the Divine nature, which is unavoidable on any scheme; but from the denial of Matter, of which there is not one word, directly or indirectly, in what you have now objected.

<Hyl>. I must acknowledge the difficulties you are concerned to clear are such only as arise from the non-existence of Matter, and are peculiar to that notion. So far you are in the right. But I cannot by any means bring myself to think there is no such peculiar repugnancy between the creation and your opinion; though indeed where to fix it, I do not distinctly know.

<Phil>. What would you have? Do I not acknowledge a twofold state of things -- the one ectypal or natural, the other archetypal and eternal? The former was created in time; the latter existed from everlasting in the mind of God. Is not this agreeable to the common notions of divines? or, is any more than this necessary in order to conceive the creation? But you suspect some peculiar repugnancy, though you know not where it lies. To take away all possibility of scruple in the case, do but consider this one point. Either you are not able to conceive {255} the Creation on any hypothesis whatsoever; and, if so, there is no ground for dislike or complaint against any particular opinion on that score: or you are able to conceive it; and, if so, why not on my Principles, since thereby nothing conceivable is taken away? You have all along been allowed the full scope of sense, imagination, and reason. Whatever, therefore, you could before apprehend, either immediately or mediately by your senses, or by ratiocination from your senses; whatever you could perceive, imagine, or understand, remains still with you. If, therefore, the notion you have of the creation by other Principles be intelligible, you have it still upon mine; if it be not intelligible, I conceive it to be no notion at all; and so there is no loss of it. And indeed it seems to me very plain that the supposition of Matter, that is a thing perfectly unknown and inconceivable, cannot serve to make us conceive anything. And, I hope it need not be proved to you that if the existence of Matter doth not make the creation conceivable, the creation's being without it inconceivable can be no objection against its non-existence.

<Hyl>. I confess, Philonous, you have almost satisfied me in this point of the creation.

<Phil>. I would fain know why you are not quite satisfied. You tell me indeed of a repugnancy between the Mosaic history and Immaterialism: but you know not where it lies. Is this reasonable, Hylas? Can you expect I should solve a difficulty without knowing what it is? But, to pass by all that, would not a man think you were assured there is no repugnancy between the received notions of Materialists and the inspired writings?

<Hyl>. And so I am.

<Phil>. Ought the historical part of Scripture to be understood in a plain obvious sense, or in a sense which is metaphysical and out of the way?

<Hyl>. In the plain sense, doubtless.

<Phil>. When Moses speaks of herbs, earth, water, &c. as having been created by God; think you not the sensible things commonly signified by those words are suggested to every unphilosophical reader?

<Hyl>. I cannot help thinking so.

<Phil>. And are not all ideas, or things perceived by sense, to be denied a real existence by the doctrine of the Materialist?

<Hyl>. This I have already acknowledged.

<Phil>. The creation, therefore, according to them, was not {256} the creation of things sensible, which have only a relative being, but of certain unknown natures, which have an absolute being, wherein creation might terminate?

<Hyl>. True.

<Phil>. Is it not therefore evident the assertors of Matter destroy the plain obvious sense of Moses, with which their notions are utterly inconsistent; and instead of it obtrude on us I know not what; something equally unintelligible to themselves and me?

<Hyl>. I cannot contradict you.

<Phil>. Moses tells us of a creation. A creation of what? of unknown quiddities, of occasions, or <substratum>? No, certainly; but of things obvious to the senses. You must first reconcile this with your notions, if you expect I should be reconciled to them.

<Hyl>. I see you can assault me with my own weapons.

<Phil>. Then as to <absolute existence>; was there ever known a more jejune notion than that? Something it is so abstracted and unintelligible that you have frankly owned you could not conceive it, much less explain anything by it. But allowing Matter to exist, and the notion of absolute existence to be clear as light; yet, was this ever known to make the creation more credible? Nay, hath it not furnished the atheists and infidels of all ages with the most plausible arguments against a creation? That a corporeal substance, which hath an absolute existence without the minds of spirits, should be produced out of nothing, by the mere will of a Spirit, hath been looked upon as a thing so contrary to all reason, so impossible and absurd! that not only the most celebrated among the ancients, but even divers modern and Christian philosophers have thought Matter co-eternal with the Deity. Lay these things together, and then judge you whether Materialism disposes men to believe the creation of things.

<Hyl>. I own, Philonous, I think it does not. This of the <creation> is the last objection I can think of; and I must needs own it hath been sufficiently answered as well as the rest. Nothing now remains to be overcome but a sort of unaccountable backwardness that I find in myself towards your notions.

<Phil>. When a man is swayed, he knows not why, to one side of' the question, can this, think you, be anything else but the effect of prejudice, which never fails to attend old and rooted {257} notions? And indeed in this respect I cannot deny the belief of Matter to have very much the advantage over the contrary opinion, with men of a learned, education.

<Hyl>. I confess it seems to be as you say.

<Phil>. As a balance, therefore, to this weight of prejudice, let us throw into the scale the great advantages that arise from the belief of Immaterialism, both in regard to religion and human learning. The being of a God, and incorruptibility of the soul, those great articles of religion, are they not proved with the clearest and most immediate evidence? When I say the being of a God, I do not mean an obscure general Cause of things, whereof we have no conception, but God, in the strict and proper sense of the word. A Being whose spirituality, omnipresence, providence, omniscience, infinite power and goodness, are as conspicuous as the existence of sensible things, of which (notwithstanding the fallacious pretences and affected scruples of Sceptics) there is no more reason to doubt than of our own being. -- Then, with relation to human sciences. In Natural Philosophy, what intricacies, what obscurities, what contradictions hath the belief of Matter led men into! To say nothing of the numberless disputes about its extent, continuity, homogeneity, gravity, divisibility, &c. -- do they not pretend to explain all things by bodies operating on bodies, according to the laws of motion? and yet, are they able to comprehend how one body should move another? Nay, admitting there was no difficulty in reconciling the notion of an inert being with a cause, or in conceiving how an accident might pass from one body to another; yet, by all their strained thoughts and extravagant suppositions, have they been able to reach the <mechanical> production of any one animal or vegetable body? Can they account, by the laws of motion, for sounds, tastes, smells, or colours; or for the regular course of things? Have they accounted, by physical principles, for the aptitude and contrivance even of the most inconsiderable parts of the universe? But, laying aside Matter and corporeal, causes, and admitting only the efficiency of an All-perfect Mind, are not all the effects of nature easy and intelligible? If the <phenomena> are nothing else but <ideas>; God is a <spirit>, but Matter an unintelligent, unperceiving being. If they demonstrate an unlimited power in their cause; God is active and omnipotent, but Matter an inert mass. If the order, regularity, and usefulness of them can {258} never be sufficiently admired; God is infinitely wise and provident, but Matter destitute of all contrivance and design. These surely are great advantages in <Physics>. Not to mention that the apprehension of a distant Deity naturally disposes men to a negligence in their moral actions; which they would be more cautious of, in case they thought Him immediately present, and acting on their minds, without the interposition of Matter, or unthinking second causes. -- Then in <Metaphysics>: what difficulties concerning entity in abstract, substantial forms, hylarchic principles, plastic natures, substance and accident, principle of individuation, possibility of Matter's thinking, origin of ideas, the manner how two independent substances so widely different as <Spirit and Matter>, should mutually operate on each other? what difficulties, I say, and

endless disquisitions, concerning these and innumerable other the like points, do we escape, by supposing only Spirits and ideas? -- Even the <Mathematics> themselves, if we take away the absolute existence of extended things, become much more clear and easy; the most shocking paradoxes and intricate speculations in those sciences depending on the. infinite divisibility of finite extension; which depends on that supposition -- But what need is there to insist on the particular sciences? Is not that opposition to all science whatsoever, that frenzy of the ancient and modern Sceptics, built on the same foundation? Or can you produce so much as one argument against the reality of corporeal things, or in behalf of that avowed utter ignorance of their natures, which doth not suppose their reality to consist in an external absolute existence? Upon this supposition, indeed, the objections from the change of colours in a pigeon's neck, or the appearance of the broken oar in the water, must be allowed to have weight. But these and the like objections vanish, if we do not maintain the being of absolute external originals, but place the reality of things in ideas,. fleeting indeed, and changeable; -- however, not changed at random, but according to the fixed order of nature. For, herein consists that constancy and truth of things which secures all the concerns of life, and distinguishes that which is real from the <irregular visions of> the fancy. {259}

<Hyl>. I agree to all you have now said., and must own that nothing can incline me to embrace your opinion more than the advantages I see it is attended with. I am by nature lazy; and this would be a mighty abridgment in knowledge. What doubts, what hypotheses, what labyrinths of amusement, what fields of disputation, what an ocean of false learning, may be avoided by that single notion of <Immaterialism>!

<Phil>. After all, is there anything farther remaining to be done? You may remember you promised to embrace that opinion which upon examination should appear most agreeable to Common Sense and remote from Scepticism. This, by your own confession, is that which denies Matter, or the <absolute> existence of corporeal things. Nor is this all; the same notion has been proved several ways, viewed in different lights, pursued in its consequences, and all objections against it cleared. Can there be a greater evidence of its truth? or is it possible it should have all the marks of a true opinion and yet be false?

<Hyl>. I own myself entirely satisfied for the present in all respects. But, what security can I have that I shall still continue the same full assent to your opinion, and that no unthought-of objection or difficulty will occur hereafter?

<Phil>. Pray, Hylas, do you in other cases, when a point is once evidently proved, withhold your consent on account of objections or difficulties it may be liable to? Are the difficulties that attend the doctrine of incommensurable quantities, of the angle of contact, of the asymptotes to curves, or the like, sufficient to make you hold out against mathematical demonstration? Or will you disbelieve the Providence of God, because there may be some particular things which you know not how to reconcile with it? If there are difficulties <attending Immaterialism>, there are at the same time direct and evident proofs of it. But for the existence of Matter there is not one proof, and far more numerous and insurmountable objections lie

against it. But where are those mighty difficulties you insist on? Alas! you know not where or what they are; something which may possibly occur hereafter. If this be a sufficient pretence for withholding your full assent, you should never yield it to any proposition, how free soever from exceptions, how clearly and solidly soever demonstrated.

<Hyl>. You have satisfied me, Philonous.

<Phil>. But, to arm you against all future objections, do but consider: That which bears equally hard on two contradictory {260} opinions can be proof against neither. Whenever, therefore, any difficulty occurs, try if you can find a solution for it on the hypothesis of the <Materialists>. Be not deceived by words; but sound your own thoughts. And in case you cannot conceive it easier by the help of <Materialism>, it is plain it can be no objection against <Immaterialism>. Had you proceeded all along by this rule, you would probably have spared yourself abundance of trouble in objecting; since of all your difficulties I challenge you to shew one that is explained by Matter: nay, which is not more unintelligible with than without that supposition; and consequently makes rather <against than> for it. You should consider, in each particular, whether the difficulty arises from the <non>-<existence of Matter>. If it doth not, you might as well argue from the infinite divisibility of extension against the Divine prescience, as from such a difficulty against <Immaterialism>. And yet, upon recollection, I believe you will find this to have been often, if not always, the case. You should likewise take heed not to argue on a <petitio principii>. One is apt to say -- The unknown substances ought to be esteemed real things, rather than the ideas in our minds: and who can tell but the unthinking external substance may concur, as a cause or instrument, in the productions of our ideas? But is not this proceeding on a supposition that there are such external substances? And to suppose this, is it not begging the question? But, above all things, you should beware of imposing on yourself by that vulgar sophism which is called <ignoratio elenchi>. You talked often as if you thought I maintained the non-existence of Sensible Things. Whereas in truth no one can be more thoroughly assured of their existence than I am. And it is you who doubt; I should have said, positively deny it. Everything that is seen, felt, heard, or any way perceived by the senses, is, on the principles I embrace, a real being; but not on yours. Remember, the Matter you contend for is an Unknown Somewhat (if indeed it may be termed <somewhat>), which is quite stripped of all sensible qualities, and can neither be perceived by sense, nor apprehended by the mind. Remember I say, that it is not any object which is hard or soft, hot or cold, blue or white, round or square, &c. For all these things I affirm do exist. Though indeed I deny they have an existence distinct from being perceived; or that they exist out of all minds whatsoever. Think on these points; let them be attentively considered and still kept in view. Otherwise you will not comprehend the state of the question; without which your objections {261} will always be wide of the mark, and, instead of mine, may possibly be directed (as more than once they have been) against your own notions.

<Hyl>. I must needs own, Philonous, nothing seems to have kept me from agreeing with you more than this same <mistaking the question>. In denying Matter,. at first, glimpse I am tempted to imagine you deny the things we see and feel: but, upon reflexion,

find there is no ground for it. What think you, therefore, of retaining the name <Matter>, and applying it to <sensible things>? This may be done without any change in your sentiments: and, believe me, it would be a means of reconciling them to some persons who may be more shocked at an innovation in words than in opinion.

<Phil>. With all my heart: retain the word <Matter>, and apply it to the objects of sense, if you please; provided you do not attribute to them any subsistence distinct from their being perceived. I shall never quarrel with you for an expression. <Matter>, or <material substance>, are terms introduced by philosophers; and, as used by them, imply a sort of independency, or a subsistence distinct from being perceived by a mind: but are never used by common people; or, if ever, it is to signify the immediate objects of sense. One would think, therefore, so long as the names of all particular things, with the <terms sensible>, <substance>, <body>, <stuff>, and the like, are retained, the word <Matter> should be never missed in common talk. And in philosophical discourses it seems the best way to leave it quite out: since there is not, perhaps, any one thing that hath more favoured and strengthened the depraved bent of the mind towards Atheism than the use of that general confused term.

<Hyl>. Well but, Philonous, since I am content to give up the notion of an unthinking substance exterior to the mind, I think you ought not to deny me the privilege of using the word <Matter> as I please, and annexing it to a collection of sensible qualities subsisting only in the mind. I freely own there is no other substance, in a strict sense, than <Spirit>. But I have been so long accustomed to the <term Matter> that I know not how to part with it: to say, there is no <Matter> in the world, is still shocking to me. Whereas to say -- There is no <Matter>, if by that term be meant an unthinking substance existing without the mind; but if by <Matter> is meant some sensible thing, whose existence consists in being perceived, then there is <Matter>: -- <this> distinction gives it quite another turn; and men will come into your notions with {262} small difficulty, when they are proposed in that manner. For, after all, the controversy about <Matter> in the strict acceptation of it, lies altogether between you and the philosophers: whose principles, I acknowledge, are not near so natural, or so agreeable to the common sense of mankind, and Holy Scripture, as yours. There is nothing we either desire or shun but as it makes, or is apprehended to make, some part of our happiness or misery. But what hath happiness or misery, joy or grief, pleasure or pain, to do with Absolute Existence; or with unknown entities, <abstracted from dl relation to us>? It is evident, things regard us only as they are pleasing or displeasing: and they can please or displease only so far forth as they are perceived. Farther, therefore, we are not concerned; and thus far you leave things as you found them. Yet still there is something new in this doctrine. It is plain, I do not now think with the Philosophers; nor yet altogether with the vulgar. I would know how the case stands in that respect; precisely, what you have added to, or altered in my former notions.

<Phil>. I do not pretend to be a setter-up of new notions. My endeavours tend only to unite, and place in a clearer light, that truth which was before shared between the vulgar and the philosophers: -- the former being of opinion, that <those things

they immediately perceive are the real things>; and the latter, that <the things immediately perceived are ideas>, <which exist only in the mind>. Which two notions put together, do, in effect, constitute the substance of what I advance.

<Hyl>. I have been a long time distrusting my senses: methought I saw things by a dim light and through false glasses. Now the glasses are removed and a new light breaks in upon my under standing. I am clearly convinced that I see things in their native forms, and am no longer in pain about their <unknown natures or absolute existence>. This is the state I find myself in at present; though, indeed, the course that brought me to it I do not yet thoroughly comprehend. You set out upon the same principles that Academics, Cartesians, and the like sects usually do; and for a long time it looked as if you were advancing their philosophical Scepticism: but, in the end, your conclusions are directly opposite to theirs.

<Phil>. You see, Hylas, the water of yonder fountain, how it is forced upwards, in a round column, to a certain height; at {263} which it breaks, and falls back into the basin from whence it rose: its ascent, as well as descent, proceeding from the same uniform law or principle of gravitation. just so, the same Principles which, at first view, lead to Scepticism, pursued to a certain point, bring men back to Common Sense.

Dedication to *The Revolutions of the Heavenly Bodies*

Nicolaus Copernicus

1543

To Pope Paul III

I can easily conceive, most Holy Father, that as soon as some people learn that in this book which I have written concerning the revolutions of the heavenly bodies, I ascribe certain motions to the Earth, they will cry out at once that I and my theory should be rejected. For I am not so much in love with my conclusions as not to weigh what others will think about them, and although I know that the meditations of a philosopher are far removed from the judgment of the laity, because his endeavor is to seek out the truth in all things, so far as this is permitted by God to the human reason, I still believe that one must avoid theories altogether foreign to orthodoxy. Accordingly, when I consider in my own mind how absurd a performance it must seem to those who know that the judgment of many centuries has approved the view that the Earth remains fixed as center in the midst of the heavens, if I should on the contrary, assert that the Earth moves; I was for a long time at a loss to know whether I should publish the commentaries which I have written in proof of its motion, or whether it were not better to follow the example of the Pythagoreans and of some others, who were accustomed to test the secrets of Philosophy not in writing but orally, and only to their relatives and friends, as the letter from Lysis to Hipparchus bears witness.

They did this, it seems to me, not as some think, because of a certain selfish reluctance to give their views to the world, but in order that the noblest truths, worked out by the careful study of great men, should not be despised by those who are vexed at the idea of taking great pains with any forms of literature except such as would be profitable, or by those who, if they are driven to the study of Philosophy for its own sake by the admonitions and the example of others, nevertheless, on account of their stupidity, hold a place among philosophers similar to that of drones among bees. Therefore, when I considered this carefully, the contempt which I had to fear because of the novelty and apparent absurdity of my view, nearly induced me to abandon utterly the work I had began.

My friends, however, in spite of long delay and even resistance on my part, withheld me from this decision. First among these was Nicolaus Schonberg, Cardinal of Capua, distinguished in all branches of learning. Next to him comes my very dear friend, Tidemann Giese, Bishop of Culm, a most earnest student, as he is, of sacred and, indeed, of all good learning. The latter has often urged me, at times even spurring me on with reproaches, to publish and at last bring to the light the book which had lain in my study not nine years merely, but already going on four times nine.

Not a few other very eminent and scholarly men made the same request, urging that I should no longer through fear refuse to give out my work for the common benefit of students of Mathematics.

They said I should find that the more absurd most men now thought this theory of mine concerning the motion of the Earth, the more admiration and gratitude it would command after they saw in the publication of my commentaries the mist of absurdity cleared away by most transparent proofs. So, influenced by these advisors and this hope, I have at length allowed my friends to publish the work, as they had long besought me to do.

But perhaps Your Holiness will not so much wonder that I have ventured to publish these studies of mine, after having taken such pains in elaborating them that I have not hesitated to commit to writing my views of the motion of the Earth, as you will be curious to hear how it occurred to me to venture, contrary to the accepted view of mathematicians, and well-nigh contrary to common sense, to form a conception of any terrestrial motion whatsoever.

Therefore I would not have it unknown to Your Holiness, that the only thing which induced me to look for another way of reckoning the movements of the heavenly bodies was that I knew that mathematicians by no means agree in their investigations thereof. For, in the first place, they are so much in doubt concerning the motion of the sun and the moon, that they can not even demonstrate and prove by observation the constant length of a complete year; and in the second place, in determining the motions both of these and of the five other planets, they fail to employ consistently one set of first principles and hypotheses, but use methods of proof based only upon the apparent revolutions and motions. For some employ concentric circles only; others eccentric circles and epicycles; and even by these means they do not completely attain the desired end. For, although those who have depended upon concentric circles have shown that certain diverse motions can be deduced from these, yet they have not succeeded thereby in laying down any sure principle, corresponding indisputably to the phenomena. These, on the other hand, who have devised systems of' eccentric circles, although they seem in great part to have solved the apparent movements by calculations which by these eccentrics are made to fit, have nevertheless introduced many things which seem to contradict the first principles of the uniformity of motion. Nor have they been able to discover or calculate from these the main point, which is the shape of the world and the fixed symmetry of its parts; but their procedure has been as if someone were to collect hands, feet, a head, and other members from various places, all very fine in themselves, but not proportionate to one body, and no single one corresponding in its turn to the others, so that a monster rather than a man would be formed from them. Thus in their process of demonstration which they term a "method," they are found to have omitted something essential, or to have included something foreign and not pertaining to the matter in hand. This certainly would never have happened to them if they had followed fixed principles; for if the hypotheses they assumed were not false, all that resulted therefrom would be verified indubitably. Those things which I am saying now may be obscure, yet they will be made clearer in their proper place.

Therefore, having turned over in my mind for a long time this uncertainty of the traditional mathematical methods of calculating the motions of the celestial bodies, I began to grow disgusted that no more consistent scheme of the movements of the mechanism of the universe, set up for our benefit by that best and most law abiding Architect of all things, was agreed upon by philosophers who otherwise investigate so carefully the most minute details of this world. Wherefore I undertook the task of re-reading the books of all the philosophers I could get access to, to see whether any one ever was of the opinion that the motions of the celestial bodies were other than those postulated by the men who taught mathematics in the schools. And I found first, indeed, in

Cicero, that Niceta perceived that the Earth moved; and afterward in Plutarch I found that some others were of this opinion, whose words I have seen fit to quote here, that they may be accessible to all: --

> **"Some maintain that the Earth is stationary, but Philolaus the Pythagorean says that it revolves in a circle about the fire of the ecliptic, like the sun and moon. Heraklides of Pontus and Ekphantus the Pythagorean make the Earth move, not changing its position, however, confined in its falling and rising around its own center in the manner of a wheel.**

Taking this as a starting point, I began to consider the mobility of the Earth; and although the idea seemed absurd, yet because I knew that the liberty had been granted to others before me to postulate all sorts of little circles for explaining the phenomena of the stars, I thought I also might easily be permitted to try whether by postulating some motions of the Earth, more reliable conclusions could be reached regarding the revolution of the heavenly bodies, than those of my predecessors.

And so, after postulating movements, which, farther on In the book, I ascribe to the Earth, I have found by many and long observations that if the movements of the other planets are assumed for the circular motion of the Earth and are substituted for the revolution of each star, not only do their phenomena follow logically therefrom, but the relative positions and magnitudes both of the stars and all their orbits, and of the heavens themselves, become so closely related that in none of its parts can anything be changed without causing confusion in the other parts and in the whole universe.

Therefore, in the course of the work I have followed this plan: I describe in the first book all the positions of the orbits together with the movements which I ascribe to the Earth, in order that this book might contain, as it were, the general scheme of the universe. Thereafter in the remaining books, I set forth the motions of the other stars and of all their orbits together with the movement of the Earth, in order that one may son, from this to what extent the movements and appearances of the other stars and their orbits can be saved, if they are transferred to the movement of the Earth. Nor do I doubt that ingenious and learned mathematicians will sustain me, if they are willing to recognize and weigh, not superficially, but with that thoroughness which Philosophy demands above all things, those matters which have been adduced by me in this work to demonstrate these theories.

In order, however, that both the learned and the unlearned equally may see that I do not avoid anyone's judgment, I have preferred to dedicate these lucubrations of mine to Your Holiness rather than to any other, because, even in this remote corner of the world where I live, you are considered to be the most eminent man in dignity of rank and in love of all learning and even of mathematics, so that by your authority and judgment you can easily suppress the bites of slanderers, albeit the proverb has it that there is no remedy for the bite of a sycophant. If perchance there shall be idle talkers, who, though they are ignorant of all mathematical sciences, nevertheless assume the right to pass judgment on these things, and if they should dare to criticize and attack this I theory of mine because of some passage of scripture which they have falsely distorted for their own purpose, I care not at all; I will even despise their judgment as foolish. For it is not unknown that Lactantius, otherwise a famous writer but a poor mathematicians, speaks most childishly of the shape of the Earth when he makes fun of those who said that the Earth has the form of a sphere. It should not seem strange then to zealous students, if some such people shall

ridicule us also. Mathematics are written for mathematicians, to whom, if my opinion does not deceive me, our labors will seem to contribute something to the ecclesiastical state whose chief office Your Holiness now occupies; for when not so very long ago, under Leo X, in the Lateran Council the question of revising the ecclesiastical calendar was discussed, it then remained unsettled, simply because the length of the years and months, and the motions of the sun and moon were held to have been not yet sufficiently determined. Since that time, I have given my attention to observing these more accurately, urged on by a very distinguished man, Paul, Bishop of Fossombrone, who at that time had charge of the matter. But what I may have accomplished herein I leave to the judgment of Your Holiness in particular, and to that of all other learned mathematicians; and lest I seem to Your Holiness to promise. more regarding the usefulness of the work than I can perform, I now pass to the work itself.

Discourse on the Method
Rene Descartes
1637

* * * *

Introductory Note

The Discourse on the Method and Essays was originally published anonymously in 1637 by Jan Maire of Leiden, in somewhat shabby form. It was Descartes' first published work, the much talked of "World" or "Cosmos" having been suppressed or destroyed on his bearing of the condemnation of Galileo in 1632. In 1636, however, when forty years of age, he felt that it was time to bring his views before the public and publish them abroad. The Elzevirs naturally suggested themselves as the publishers to be selected, especially as they had once before made advances and as the original member of the firm resided in Leiden, where Descartes probably was at the time. They, however, had become less friendly, evidently doubting the success of an anonymous book of the kind, and consequently the author went elsewhere. Descartes endeavored to preserve the anonymity of his work with scrupulous care, and was annoyed by his zealous but fussy friend Mersenne showing the work to others, and announcing the author's name, with the ostensible object of obtaining from the King of France permission for its publication. In the end he found himself compelled to avow his authorship.

The book was written in French "the language of my country," as Descartes says, "in the hope that those who avail themselves of their natural reason alone, may be better judges of my opinions than those who give heed only to the writings of the ancients." Four hundred copies were given him for distribution to his friends and this was probably all the remuneration that he expected; none other seems in any case to have come to him.

The Latin version is the work of Etienne de Courcelles, a Protestant minister at Amsterdam, and was published in 1644 by Louis Elzevir at the same time as the "Principles." The Essays (the Dioptric, the Meteors and the Geometry) which are termed "Essays on this Method" have not been translated here.

Elizabeth. S. Haldane, 1911

Discourse on the Method
Of Rightly Conducting the Reason
And Seeking for Truth in the Sciences.

If this Discourse appears too long to be read all at once, it may be separated into six portions. And in the

first these will be found various considerations respecting the sciences; in the second, the principal rules regarding the method which the author has sought out; while in the third are some of the rules of morality which he has derived from this Method. In the fourth are the reasons by which he proves the existence of God and of the human soul, which farm the foundation of his Metaphysic. In the fifth, the order of the questions regarding physics which he has investigated, and particularly the explanation of the movement of the heart, and of some other difficulties which pertain to medicine, as also the deference between the soul of man and that of the brutes. And in the last part the questions raised relate to those matters which the author believes to be requisite in order to advance further in the investigation of nature, in addition to the reasons that caused him to write.

PART I.

Good sense is of all things in the world the most equally distributed, for everybody thinks himself so abundantly provided with it, that even those most difficult to please in all other matters do not commonly desire more of it than they already possess. It is unlikely that this is an error on their part; it seems rather to be evidence in support of the view that the power of forming a good judgment and of distinguishing the true from the false, which is properly speaking what is called Good sense or Reason, is by nature equal in all men. Hence too it will show that the diversity of our opinions does not proceed from some men being more rational than others, but solely from the fact that our thoughts pass through {82}diverse channels and the same objects are not considered by an. For to be possessed of good mental powers is not sufficient; the principal matter is to apply them well. The greatest minds are capable of the greatest vices as well as of the greatest virtues, and those who proceed very slowly may, provided they always follow the straight road, really advance much faster than those who, though they run, forsake it.

For myself I have never ventured to presume that my mind was in any way more perfect than that of the ordinary man; I have even longed to possess thought as quick, or an imagination as accurate and distinct, or a memory as comprehensive or ready, as some others. And besides these I do not know any other qualities that make for the perfection of the human mind. For as to reason or sense, inasmuch as it is the only thing that constitutes us men and distinguishes us from the brutes, I would fain believe that it is to be found complete in each individual, and in this I follow the common opinion of the philosophers, who say that the question of more or less occurs only in the sphere of the <accidents> and does not affect the <forms> or natures of the <individuals> in the same <species>.

But I shall not hesitate to say that I have had great good fortune from my youth up, in lighting upon and pursuing certain paths which have conducted me to considerations and maxims from which I have formed a Method, by whose assistance it appears to me I have the means of gradually increasing my knowledge and of little by little raising it

to the highest possible point which the mediocrity of my talents and the brief duration of my life call permit me to reach. For I have already reaped from it fruits of such a nature that, even though I always try in the judgments I make on myself to lean to the side of self-depreciation rather than to that of arrogance, and though, looking with the eye of a philosopher on the diverse actions and enterprises of all mankind, I find scarcely any which do not seem to me vain and useless, I do not cease to receive extreme satisfaction in the progress which I seem to have already made in the search after truth, and to form such hopes for the future as to venture to believe that, if amongst the occupations of men, simply as men, there is some one in particular that is excellent and important, that is the one which I have selected.

It must always be recollected, however, that possibly I deceive myself, and that what I take to be gold and diamonds is perhaps no {83} more than copper and glass. I know how subject we are to delusion in whatever touches ourselves, and also how much the judgments of our friends ought to be suspected when they are in our favor. But in this Discourse I shall be very happy to show the paths I have followed, and to set forth my life as in a picture, so that everyone may judge of it for himself; and thus in learning from the common talk what are the opinions which are held of it, a new means of obtaining self-instruction will be reached, which I shall add to those which I have been in the habit of using.

Thus my design is not here to teach the Method which everyone should follow in order to promote the good conduct of his Reason, but only to show in what manner I have endeavored to conduct my own. Those who set about giving precepts must esteem themselves more skillful than those to whom they advance them, and if they fall short in the smallest matter they must of course take the blame for it. But regarding this Treatise simply as a history, or, if you prefer it, a fable in which, amongst certain things which may be imitated, there are possibly others also which it would not be right to follow, I hope that it will be of use to some without being hurtful to any, and that all will thank me for my frankness.

I have been nourished on letters since my childhood, and since I was given to believe that by their means a clear and certain knowledge could be obtained of all that is useful in life, I had an extreme desire to acquire instruction. But so soon as I had achieved the entire course of study at the close of which one is usually received into the ranks of the learned, I entirely changed my opinion. For I found myself embarrassed with so many doubts and errors that it seemed to me that the effort to instruct myself had no effect other than the increasing discovery of my own ignorance. And yet I was studying at one of the most celebrated Schools in Europe, where I thought that there must be men of learning if they were to be found anywhere in the world. I learned there all that others learned; and not being satisfied with the sciences that we were taught, I even read through all the books which fell into my hands, treating of what is considered most curious and rare. Along

with this I knew the judgments that others had formed of me, and I did not feel that I was esteemed inferior to my fellow-students, although there were amongst them some destined to fill the places of our masters. And finally our century seemed to me as flourishing, and as fertile in great minds, as any which had preceded. And this made me take the liberty of judging all {84} others by myself and of coming to the conclusion that there was no learning in the world such as I was formerly led to believe it to be.

I did not omit, however, always to hold in esteem those exercises which are the occupation of the Schools. I knew that the Languages which one learns there are essential for the understanding of all ancient literature; that fables with their charm stimulate the mind and histories of memorable deeds exalt it; and that, when read with discretion, these books assist in forming a sound judgment. I was aware that the reading of all good books is indeed like a conversation with the noblest men of past centuries who were the authors of them, nay a carefully studied conversation, in which they reveal to us none but the best of their thoughts. I deemed Eloquence to have a power and beauty beyond compare; that Poesy has most ravishing delicacy and sweetness; that in Mathematics there are the subtlest discoveries and inventions which may accomplish much, both in satisfying the curious, and in furthering all the arts, and in diminishing man's labor; that those writings that deal with Morals contain much that is instructive, and many exhortations to virtue which are most useful; that Theology points out the way to Heaven; that Philosophy teaches us to speak with an appearance of truth on all things, and causes us to be admired by the less learned; that Jurisprudence, Medicine and all other sciences bring honor and riches to those who cultivate them; and finally that it is good to have examined all things, even those most full of superstition and falsehood, in order that we may know their just value, and avoid being deceived by them.

But I considered that I had already given sufficient time to languages and likewise even to the reading of the literature of the ancients, both their histories and their fables. For to converse with those of other centuries is almost the same thing as to travel. It is good to know something of the customs of different peoples in order to judge more sanely of our own, and not to think that everything of a fashion not ours is absurd and contrary to reason, as do those who have seen nothing. But when one employs too much time in traveling, one becomes a stranger in one's own country, and when one is too curious about things which were practiced in past centuries, one is usually very ignorant about those which are practiced in our own time. Besides, fables make one imagine many events possible which in reality are not so, and even the most accurate of histories, if they do not exactly misrepresent {85} or exaggerate the value of things in order to render them more worthy of being read, at least omit in them all the circumstances which are basest and least notable; and from this fact it follows that what is retained is not portrayed as it really is, and that those who regulate their conduct by examples which they derive from such a source,

are liable to fall into the extravagances of the knights-errant of Romance, and form projects beyond their power of performance.

I esteemed Eloquence most highly and I was enamored of Poesy, but I thought that both were gifts of the mind rather than fruits of study. Those who have the strongest power of reasoning, and who most skillfully arrange their thoughts in order to render them clear and intelligible, have the best power of persuasion even if they can bat speak the language of Lower Brittany and have never learned Rhetoric. And those who have the most delightful original ideas and who know how to express them with the maximum of style and suavity, would not fail to be the beat poets even if the art of Poetry were unknown to them.

Most of all was I delighted with Mathematics because of the certainty of its demonstrations and the evidence of its reasoning; but I did not yet understand its true use, and, believing that it was of service only in the mechanical arts, I was astonished that, seeing how firm and solid was its basis, no loftier edifice had been reared thereupon. On the other hand I compared the works of the ancient pagans which deal with Morals to palaces most superb and magnificent, which are yet built on sand and mud alone. They praise the virtues most highly and show them to be more worthy of being prized than anything else in the world, but they do not sufficiently teach us to become acquainted with them, and often that which is called by a fine name is nothing but insensibility, or pride, or despair, or parricide.

I honored our Theology and aspired as much as anyone to reach to heaven, but having learned to regard it as a most highly assured fact that the road is not less open to the most ignorant than to the most learned, and that the revealed truths which conduct thither are quite above our intelligence, I should not have dared to submit them to the feebleness of my reasonings; and I thought that, in order to undertake to examine them and succeed in so doing, it was necessary to have some extraordinary assistance from above and to be more than a mere man.

I shall not say anything about Philosophy, but that seeing that {86} it has been cultivated for many centuries by the best minds that have ever lived, and that nevertheless no single thing is to be found in it which is not subject of dispute, and in consequence which is not dubious, I had not enough presumption to hope to fare better there than other men had done. And also, considering how many conflicting opinions there may be regarding the self-same matter, all supported by learned people, while there can never be more than one which is true, I esteemed as well-nigh false all that only went as far as being probable.

Then as to the other sciences, inasmuch as they derive their principles from Philosophy, I judged that one could have built nothing solid on foundations so far from firm. And neither the honor nor the promised gain was sufficient to persuade me to cultivate them, for, thanks be to God, I did not find myself in a condition which obliged me to make

a merchandise of science for the improvement of my fortune; and, although I did not pretend to scorn all glory like the Cynics, I yet had very small esteem for what I could not hope to acquire, excepting through fictitious titles. And, finally, as to false doctrines, I thought that I already knew well enough what they were worth to be subject to deception neither by the promises of an alchemist, the predictions of an astrologer, the impostures of a magician, the artifices or the empty boastings of any of those who make a profession of knowing that of which they are ignorant.

This is why, as soon as age permitted me to emerge from the control of my tutors, I entirely quitted the study of letters. And resolving to seek no other science than that which could be found in myself, or at least in the great book of the world, I employed the rest of my youth in travel, in seeing courts and armies, in intercourse with men of diverse temperaments and conditions, in collecting varied experiences, in proving myself in the various predicaments in which I was placed by fortune, and under all circumstances bringing my mind to bear on the things which came before it, so that I might derive some profit from my experience. For it seemed to me that I might meet with much more truth in the reasonings that each man makes on the matters that specially concern him, and the issue of which would very soon punish him if he made a wrong judgment, than in the case of those made by a man of letters in his study touching speculations which lead to no result, and which bring about no other consequences to himself excepting that he will be all the more vain the more they are removed from common sense, {87} since in this case it Proves him to have employed so much the more ingenuity and skill in trying to make them seem probable. And I always had an excessive desire to learn to distinguish the true from the false, in order to see clearly in my actions and to walk with confidence in this life.

It is true that while I only considered the manners of other men I found in them nothing to give me settled convictions; and I remarked in them almost as much diversity as I had formerly seen in the opinions of philosophers. So much was this the case that the greatest profit which I derived from their study was that, in seeing many things which, although they seem to us very extravagant and ridiculous, were yet commonly received and approved by other great nations, I learned to believe nothing too certainly of which I had only been convinced by example and custom. Thus little by little I was delivered from many errors which might have obscured our natural vision and rendered us less capable of listening to Reason. But after I had employed several years in thus studying the book of the world and trying to acquire some experience, I one day formed the resolution of also making myself an object of study and of employing all the strength of my mind in choosing the road I should follow. This succeeded much better, it appeared to me, than if I had never departed either from my country or my books.

PART II.

I was then in Germany, to which country I had been attracted by the wars which are not yet at an end. And as I was returning from the coronation of the Emperor to join the army, the setting in of winter detained me in a quarter where, since I found no society to divert me, while fortunately I had also no cares or passions to trouble me, I remained the whole day shut up alone in a stove-heated room, where I had complete leisure to occupy myself with my own thoughts. One of the first of the considerations that occurred to me was that there is very often less perfection in works composed of several portions, and carried out by the hands of various masters, than in those on which one individual alone has worked. Thus we see that buildings planned and carried out by one architect alone are usually more beautiful and better proportioned than those which many have tried to put in order and improve, making use of old walls which were built with other ends in view. In the game way also, those ancient cities which, originally mere villages, have become in the process of time great towns, are usually {88} badly constructed in comparison with those which are regularly laid out on a plain by a surveyor who is free to follow his own ideas. Even though, considering their buildings each one apart, there is often as much or more display of skill in the one case than in the other, the former have large buildings and small buildings indiscriminately placed together, thus rendering the streets crooked and irregular, so that it might be said that it was chance rather than the will of men guided by reason that led to such an arrangement. And if we consider that this happens despite the fact that from all time there have been certain officials who have had the special duty of looking after the buildings of private individuals in order that they may be public ornaments, we shall understand how difficult it is to bring about much that is satisfactory in operating only upon the works of others. Thus I imagined that those people who were once half-ravage, and who have become civilized only by slow degrees, merely forming their laws as the disagreeable necessities of their crimes and quarrels constrained them, could not succeed in establishing so good a system of government as those who, from the time they first came together as communities, carried into effect the constitution laid down by some prudent legislator. Thus it is quite certain that the constitution of the true Religion whose ordinances are of God alone is incomparably better regulated than any other. And, to come down to human affairs, I believe that if Sparta was very flourishing in former times, this was not because of the excellence of each and every one of its laws, seeing that many were very strange and even contrary to good morals, but because, being drawn up by one individual, they all tended towards the same end. And similarly I thought that the sciences found in books-in those at least whose reasonings are only probable and which have no demonstrations, composed as they are of the gradually accumulated opinions of many different individuals-do not approach so near to the truth as the simple reasoning which a man of common sense can quite naturally carry out respecting the things which come immediately before him. Again I thought that since we have all been children before being men, and since it has for long fallen to us to be governed by our appetites and by our teachers (who often enough contradicted one another, and

none of whom perhaps counseled us always for the best), it is almost impossible that our judgments should be so excellent or solid as they should have been had we had complete use of our reason since our birth, and had we been guided by its means alone. {89}

It is true that we do not find that all the houses in a town are razed to the ground for the sole reason that the town is to be rebuilt in another fashion, with streets made more beautiful; but at the same time we see that many people cause their own houses to be knocked down in order to rebuild them, and that sometimes they are forced so to do where there is danger of the houses falling of themselves, and when the foundations are not secure. From such examples I argued to myself that there was no plausibility in the claim of any private individual to reform a state by altering everything, and by overturning it throughout, in order to set it right again. Nor is it likewise probable that the whole body of the Sciences, or the order of teaching established by the Schools, should be reformed. But as regards all the opinions which up to this time I had embraced, I thought I could not do better than endeavor once for all to sweep them completely away, so that they might later on be replaced, either by others which were better, or by the same, when I had made them conform to the uniformity of a rational scheme. And I firmly believed that by this means I should succeed in directing my life much better than if I had only built on old foundations, and relied on principles of which I allowed myself to be in youth persuaded without having inquired into their truth. For although in so doing I recognized various difficulties, these were at the same time not insurmountable, nor comparable to those which are found in reformation of the most insignificant kind in matters which concern the public. In the case of great bodies it is too difficult a task to raise them again when they are once thrown down, or even to keep them in their places when once thoroughly shaken; and their fall cannot be otherwise than very violent. Then as to any imperfections that they may possess (and the very diversity that is found between them is sufficient to tell us that these in many cases exist) custom has doubtless greatly mitigated them, while it has also helped us to avoid, or insensibly corrected a number against which mere foresight would have found it difficult to guard. And finally the imperfections are almost always more supportable than would be the process of removing them, just as the great roads which wind about amongst the mountains become, because of being frequented, little by little so well-beaten and easy that it is much better to follow them than to try to go more directly by climbing over rocks and descending to the foot of precipices.

This is the reason why I cannot in any way approve of those turbulent and unrestful spirits who, being called neither by birth {90} nor fortune to the management of public affairs, never fail to have always iii their minds some new reforms. And if I thought that in this treatise there was contained the smallest justification for this folly, I should be very sorry to allow it to be published. My design has never extended beyond trying to reform my own opinion and to build on a foundation which is entirely my

own. If my work has given me a certain satisfaction, so that I here present to you a draft of it, I do not so do because I wish to advise anybody to imitate it. Those to whom God has been most beneficent in the bestowal of His graces will perhaps form designs which are more elevated; but I fear much that this particular one will seem too venturesome for many. The simple resolve to strip oneself of all opinions and beliefs formerly received is not to be regarded as an example that each man should follow, and the world may be said to be mainly composed of two classes of minds neither of which could prudently adopt it. There are those who, believing themselves to be cleverer than they are, cannot restrain themselves from being precipitate in judgment and have not sufficient patience to arrange their thoughts in proper order; hence, once a man of this description had taken the liberty of doubting the principles he formerly accepted, and had deviated from the beaten track, he would never be able to maintain the path which must be followed to reach the appointed end more quickly, and he would hence remain wandering astray all through his life. Secondly, there are those who having reason or modesty enough to judge that they are less capable of distinguishing truth from falsehood than some others from whom instruction might be obtained, are right in contenting themselves with following the opinions of these others rather than in searching better ones for themselves.

For myself I should doubtless have been of these last if I had never had more than a single master, or had I never known the diversities which have from all time existed between the opinions of men of the greatest learning. But I had been taught, even in my College days, that there is nothing imaginable so strange or so little credible that it has not been maintained by one philosopher or other, and I further recognized in the course of my travels that all those whose sentiments are very contrary to ours are yet not necessarily barbarians or savages, but may be possessed of reason in as great or even a greater degree than ourselves. I also considered how very different the self-same man, identical in mind and spirit, may become, according as he is brought up from childhood amongst the French or Germans, or has passed his whole life amongst Chinese or {91} cannibals. I likewise noticed how even in the fashions of one's clothing the same thing that pleased us ten years ago, and which will perhaps please us once again before ten years are passed, seems at the present time extravagant and ridiculous. I thus concluded that it is much more custom and example that persuade us than any certain knowledge, and yet in spite of this the voice of the majority does not afford a proof of any value in truths a little difficult to discover, because such truths are much more likely to have been discovered by one man than by a nation. I could not, however, put my finger on a single person whose opinions seemed preferable to those of others, and I found that I was, so to speak, constrained myself to undertake the direction of my procedure.

But like one who walks alone and in the twilight I resolved to go so slowly, and to use so much circumspection in all things, that if my advance was but very small, at least I guarded myself well from falling. I did not wish to

set about the final rejection of any single opinion which might formerly have crept into my beliefs without having been introduced there by means of Reason, until I had first of all employed sufficient time in planning out the task which I had undertaken, and in seeking the true Method of arriving at a knowledge of all the things of which my mind was capable.

Among the different branches of Philosophy, I had in my younger days to a certain extent studied Logic; and in those of Mathematics, Geometrical Analysis and Algebra-three arts or sciences which seemed as though they ought to contribute something to the design I had in view. But in examining them I observed in respect to Logic that the syllogisms and the greater part of the other teaching served better in explaining to others those things that one knows (or like the art of Lully, in enabling one to speak without judgment of those things of which one is ignorant) than in learning what is new. And although in reality Logic contains many precepts which are very true and very good, there are at the same time mingled with them so many others which are hurtful or superfluous, that it is almost as difficult to separate the two as to draw a Diana or a Minerva out of a block of marble which is not yet roughly hewn. And as to the Analysis of the ancients and the Algebra of the moderns, besides the fact that they embrace only matters the most abstract, such as appear to have no actual use, the former is always so restricted to the consideration of symbols that it cannot exercise the Understanding without greatly fatiguing the imagination; and in the latter one is so subjected to certain rules and formulas that {92} the result is the construction of an art which is confused and obscure, and which embarrasses the mind, instead of a science which contributes to its cultivation. This made me feel that some other Method must be found, which, comprising the advantages of the three, is yet exempt from their faults. And as a multiplicity of laws often furnishes excuses for evil-doing, and as a State is hence much better ruled when, having but very few laws, these are most strictly observed; so, instead of the great number of precepts of which Logic is composed, I believed that I should find the four which I shall state quite sufficient, provided that I adhered to a firm and constant resolve never on any single occasion to fail in their observance.

The first of these was to accept nothing as true which I did not clearly recognize to be so: that is to say, carefully to avoid precipitation and prejudice in judgments, and to accept in them nothing more than what was presented to my mind so clearly and distinctly that I could have no occasion to doubt it.

The second was to divide up each of the difficulties which I examined into as many parts as possible, and as seemed requisite in order that it might be resolved in the best manner possible.

The third was to carry on my reflections in due order, commencing with objects that were the most simple and easy to understand, in order to rise little by little, or by degrees, to knowledge of the most complex, assuming an

order, even if a fictitious one, among those which do not follow a natural sequence relatively to one another.

The last was in all cases to make enumerations so complete and reviews so general that I should be certain of having omitted nothing.

Those long chains of reasoning, simple and easy as they are, of which geometricians make use in order to arrive at the most difficult demonstrations, had caused me to imagine that all those things which fall under the cognizance of man might very likely be mutually related in the same fashion; and that, provided only that we abstain from receiving anything a8 true which is not so, and always retain the order which is necessary in order to deduce the one conclusion from the other, there can be nothing so remote that we cannot reach to it, nor so recondite that we cannot discover it. And I had not much trouble in discovering which objects it was necessary to begin with, for I already knew that it was with the most simple and those most easy to apprehend. Considering also that, of all those who have hitherto sought for the truth in the {93} Sciences, it has been the mathematicians alone who have been able to succeed in making any demonstrations, that is to say producing reasons which are evident and certain, I did not doubt that it had been by means of a similar kind that they carried on their investigations. I did not at the same time hope for any practical result in so doing, except that my mind would become accustomed to the nourishment of truth and would not content itself with false reasoning. But for all that I had no intention of trying to master all those particular sciences that receive in common the name of Mathematics; but observing that, although their objects are different, they do not fail to agree in this, that they take nothing under consideration but the various relationships or proportions which are present in these objects, I thought that it would be better if I only examined these proportions in their general aspect, and without viewing them otherwise than in the objects which would serve most to facilitate a knowledge of them. Not that I should in any way restrict them to these objects, for I might later on all the more easily apply them to all other objects to which they were applicable. Then, having carefully noted that in order to comprehend the proportions I should sometimes require to consider each one in particular, and sometimes merely keep them in mind, or take them in groups, I thought that, in order the better to consider them in detail, I should picture them in the form of lines, because I could find no method more simple nor more capable of being distinctly represented to my imagination and senses. I considered, however, that in order to keep them in my memory or to embrace several at once, it would be essential that I should explain them by means of certain formulas, the shorter the better. And for this purpose it was requisite that I should borrow all that is best in Geometrical Analysis and Algebra, and correct the errors of the one by the other.

As a matter of fact, I can venture to say that the exact observation of the few precepts which I had chosen gave me so much facility in sifting out all the questions embraced in these two sciences, that in the two or three

months which I employed in examining them -- commencing with the most simple and general, and making each truth that I discovered a rule for helping me to find others -- not only did I arrive at the solution of many questions which I had hitherto regarded as most difficult, but, towards the end, it seemed to me that I was able to determine in the case of those of which I was still ignorant, by what means, and in how far, it was possible to {94} solve them. In this I might perhaps appear to you to be very vain if you did not remember that having but one truth to discover in respect to each matter, whoever succeeds in finding it knows in its regard as much as can be known. It is the same as with a child, for instance, who has been instructed in Arithmetic and has made an addition according to the rule prescribed; he may be sure of having found as regards the sum of figures given to him all that the human mind can know. For, in conclusion, the Method which teaches us to follow the true order and enumerate exactly every term in the matter under investigation contains everything which gives certainty to the rules of Arithmetic.

But what pleased me most in this Method was that I was certain by its means of exercising my reason in all things, if not perfectly, at least as well as was in my power. And besides this, I felt in making use of it that my mind gradually accustomed itself to conceive of its objects more accurately and distinctly; and not having restricted this Method to any particular matter, I promised myself to apply it as usefully to the difficulties of other sciences as I had done to those of Algebra. Not that on this account I dared undertake to examine just at once all those that might present themselves; for that would itself have been contrary to the order which the Method prescribes. But having noticed that the knowledge of these difficulties must be dependent on principles derived from Philosophy in which I yet found nothing to be certain, I thought that it was requisite above all to try to establish certainty in it. I considered also that since this endeavor is the most important in all the world, and that in which precipitation and prejudice were most to be feared, I should not try to grapple with it till I had attained to a much riper age than that of three and twenty, which was the age I had reached. I thought, too, that I should first of all employ much time in preparing myself for the work by eradicating from my mind all the wrong opinions which I had up to this time accepted, and accumulating a variety of experiences fitted later on to afford matter for my reasonings, and by ever exercising myself in the Method which I had prescribed, in order more and more to fortify myself in the power of using it. {95}

PART III.

And finally, as it is not sufficient, before commencing to rebuild the house which we inhabit, to pull it down and provide materials and an architect (or to act in this capacity ourselves, and make a careful drawing of its design), unless we have also provided ourselves with some other house where we can be comfortably lodged during the time of rebuilding, so in order that I should not remain irresolute in my actions while reason obliged me to be so in my judgments, and that I might not omit to carry on my life

as happily as I could, I formed for myself a code of morals for the time being which did not consist of more than three or four maxims, which maxims I should like to enumerate to you.

The first was to obey the laws and customs of my country, adhering constantly to the religion in which by God's grace I had been instructed since my childhood, and in all other things directing my conduct by opinions the most moderate in nature, and the farthest removed from excess in all those which are commonly received and acted on by the most judicious of those with whom I might come in contact. For since I began to count my own opinions as naught, because I desired to place all under examination, I was convinced that I could not do better than follow those held by people on whose judgment reliance could be placed. And although such persons may possibly exist amongst the Persians and Chinese as well as amongst ourselves, it seemed to me that it was most expedient to bring my conduct into harmony with the ideas of those with whom I should have to live; and that, in order to ascertain that these were their real opinions, I should observe what they did rather than what they said, not only because in the corrupt state of our manners there are few people who desire to say all that they believe, but also because many are themselves ignorant of their beliefs. For since the act of thought by which we believe a thing is different from that by which we know that we believe it, the one often exists without the other. And amongst many opinions all equally received, I chose only the most moderate, both because these are always most suited for putting into practice, and probably the best (for all excess has a tendency to be bad), and also because I should have in a less degree turned aside from the right path, supposing that I was wrong, than if, having chosen an extreme course, I found that I had chosen amiss. I also made a point of counting as excess all the engagements by means of which we limit {96} in some degree our liberty. Not that I hold in low esteem those laws which, in order to remedy the inconstancy of feeble souls, permit, when we have a good object in our view, that certain vows be taken, or contracts made, which oblige us to carry out that object. This sanction is even given for security in commerce where designs are wholly indifferent. But because I saw nothing in all the world remaining constant, and because for my own part I promised myself gradually to get my judgments to grow better and never to grow worse, I should have thought that I had committed a serious sin against commonsense if, because I approved of something at one time, I was obliged to regard it similarly at a later time, after it had possibly ceased to meet my approval, or after I had ceased to regard it in a favorable light.

My second maxim was that of being as firm and resolute in my actions as I could be, and not to follow less faithfully opinions the most dubious, when my mind was once made up regarding them, than if these had been beyond doubt. In this I should be following the example of travelers, who, finding themselves lost in a forest, know that they ought not to wander first to one side and then to the other, nor, still less, to stop in one place, but understand that they should continue to walk as straight as they can in one

direction, not diverging for any slight reason, even though it was possibly chance alone that first determined them in their choice. By this means if they do not go exactly where they wish, they will at least arrive somewhere at the end, where probably they will be better off than in the middle of a forest. And thus since often enough in the actions of life no delay is permissible, it is very certain that, when it is beyond our power to discern the opinions which carry most truth, we should follow the most probable; and even although we notice no greater probability in the one opinion than in the other, we at least should make up our minds to follow a particular one and afterwards consider it as no longer doubtful in its relationship to practice, but as very true and very certain, inasmuch as the reason,which caused us to determine upon it is known to be so. And henceforward this principle was sufficient to deliver me from all the penitence and remorse which usually affect the mind and agitate the conscience of those weak and vacillating creatures who allow themselves to keep changing their procedure, and practice as good, things which they afterwards judge to be evil.

My third maxim was to try always to conquer myself rather than fortune, and to alter my desires rather than change the order {97} of the world, and generally to accustom myself to believe that there is nothing entirely within our power but our own thoughts: so that after we have done our best in regard to the things that are without us, our ill-success cannot possibly be failure on our part.[2] And this alone seemed to me sufficient to prevent my desiring anything in the future beyond what I could actually obtain, hence rendering me content; for since our will does not naturally induce us to desire anything but what our understanding represents to it as in some way possible of attainment, it is certain that if we consider all good things which are outside of us as equally outside of our power, we should not have more regret in resigning those goods which appear to pertain to our birth, when we are deprived of them for no fault of our own, than we have in not possessing the kingdoms of China or Mexico. In the same way, making what is called a virtue out of a necessity, we should no more desire to be well if ill, or free, if in prison, than we now do to have our bodies formed of a substance as little corruptible as diamonds, or to have Wings to fly with like birds. I allow, however, that to accustom oneself to regard all things from this point of view requires long exercise and meditation often repeated; and I believe that it is principally in this that is to be found the secret of those philosophers who, in ancient times, were able to free themselves from the empire of fortune, or, despite suffering or poverty, to rival their gods in their happiness. For, ceaselessly occupying themselves in considering the limits which were prescribed to them by nature, they persuaded themselves so completely that nothing was within their own power but their thoughts, that this conviction alone was sufficient to prevent their leaving any longing for other things. And they had so absolute a mastery over their thoughts that they had some reason for esteeming themselves as more rich and more powerful, and more free and more happy than other men, who, however favored by nature or fortune they might be, if

devoid of this philosophy, never could arrive a& all at which they aim.

And last of all, to conclude this moral code, I felt it incumbent on me to make a review of the various occupations of men in this life in order to try to choose out the best; and without wishing to say anything of the employment of others I thought that I could I "So that whatever does not eventuate after we have done all in our power that it should happen is to be accounted by us as among the things which evidently cannot be done and which in philosophical phrase are called impossible." Latin Version. {98} not do better than continue in the one in which I found myself engaged, that is to say, in occupying my whole life in cultivating my Reason, and in advancing myself as much as possible in the knowledge of the truth in accordance with the method which I had prescribed myself. I had experienced so much satisfaction since beginning to use this method, that I did not believe that any sweeter or more innocent could in this life be found,-every day discovering by its means some truths which seemed to me sufficiently important, although commonly ignored by other men. The,satisfaction which I had so filled my mind that all else- seemed of no account. And, besides, the three preceding maxims were founded solely on the plan which I had formed of continuing to instruct myself. For since God has given to each of us some light with which to distinguish truth from error, I could not believe that I ought for a single moment to content myself with accepting the opinions held by others unless I had in view the employment of my own judgment in examining them at the proper time; and I could not have held myself free of scruple in following such opinions, if nevertheless I had not intended to lose no occasion of finding superior opinions, supposing them to exist; and finally, I should not have been able to restrain my desires nor to remain content, if I had not followed a road by which, thinking that I should be certain to be able to acquire all the knowledge of which I was capable, I also thought I should likewise be certain of obtaining all the best things which could ever come within my power. And inasmuch as our will impels us neither to follow after nor to flee from anything, excepting as our understanding represents it as good or evil, it is sufficient to judge wisely in order to act well, and the best judgment brings the best action-that is to say, the acquisition of all the virtues and all the other good things that it is possible to obtain. When one is certain that this point is reached, one cannot fail to be contented.

Having thus assured myself of these maxims, and having set them on one side along with the truths of religion which have always taken the first place in my creed, I judged that as far as the rest of my opinions were concerned, I could safely undertake to rid myself of them. And inasmuch as I hoped to be able to reach my end more successfully in converse with man than in living longer shut up in the warm room where these reflections had come to me, I hardly awaited the end of winter before I once more set myself to travel. And in all the nine following years I did naught but roam {99} hither and thither, trying to be a spectator rather than an actor in all the comedies the world displays. More especially did I reflect in each matter that came

before me as to anything which could make it subject to suspicion or doubt, and give occasion for mistake, and I rooted out of my mind all the errors which might have formerly crept in. Not that indeed I imitated the skeptics, who only doubt for the sake of doubting, and pretend to be always uncertain; for, on the contrary, my design was only to provide myself with good ground for assurance, and to reject the quicksand and mud in order to find the rock or clay. In this task it seems to me, I succeeded pretty well, since in trying to discover the error or uncertainty of the propositions which I examined, not by feeble conjectures, but by clear and assured reasonings, I encountered nothing so dubious that I could not draw from it some conclusion that was tolerably secure, if this were no more than the inference that it contained in it nothing that was certain. And just as in pulling down an old house we usually preserve the debris to serve in building up another, so in destroying all those opinions which I considered to be ill-founded, I made various observations and acquired many experiences, which have since been of use to me in establishing those which are more certain. And more than this, I continued to exercise myself in the method which I had laid down for my use; for besides the fact that I was careful as a rule to conduct all my thoughts according to its maxims, I set aside some hours from time to time which I more especially employed in practicing myself in the solution of mathematical problems according to the Method, or in the solution of other problems which though pertaining to other sciences, I was able to make almost similar to those of mathematics, by detaching them from all principles of other sciences which I found to be not sufficiently secure. You will see the result in many examples which are expounded in this volume.[3] And hence, without living to all appearance in any way differently from those who, having no occupation beyond spending their lives in ease and innocence, study to separate pleasure from vice, and who, in order to enjoy their leisure without weariness, make use of all distractions that are innocent and good, I did not cease to prosecute my design, and to profit perhaps even more in my study of truth than if I had done nothing but read books or associate with literary people. {100}

These nine years thus passed away before I had taken any definite part in regard to the difficulties as to which the learned are in the habit of disputing, or had commenced to seek the foundation of any philosophy more certain than the vulgar. And the example of many excellent men who had tried to do the same before me, but, as it appears to me, without success, made me imagine it to be so hard that possibly I should not have dared to undertake the task, had I not discovered that someone had spread abroad the report that I had already reached its conclusion. I cannot tell on what they based this opinion; if my conversation has contributed anything to it, this must have arisen from my confessing my ignorance more ingenuously than those who have studied a little usually do. And perhaps it was also due to my having shown forth my reasons for doubting many things which were held by others to be certain, rather than from having boasted of any special philosophic system. But being at heart honest enough not to desire to be esteemed as different from what I am, I thought that I must try by every

means in my power to render myself worthy of the reputation which I had gained. And it is just eight years ago that this desire made me resolve to remove myself from all places where any acquaintances were possible, and to retire to a country such as this,4 where the long-continued war has caused such order to be established that the armies which are maintained seem only to be of use in allowing the inhabitants to enjoy the fruits of peace with so much the more security; and where, in the crowded throng of a great and very active nation, which is more concerned with its own affairs than curious about those of others, without missing ally of the conveniences of the most populous towns, I can live as solitary and retired as in deserts the most remote.

PART IV.

I do not know that I ought to tell you of the first meditations there made by me, for they are so metaphysical and so unusual that they may perhaps not be acceptable to everyone. And yet at the same time, in order that one may judge whether the foundations which I have laid are sufficiently secure, I find myself constrained in some measure to refer to them. For a long time I had remarked that it is sometimes requisite in common life to follow opinions which one knows to be most uncertain, exactly as though they were indisputable, as has been said above. But because in this case {101} I wished to give myself entirely to the search after Truth, I thought that it was necessary for me to take an apparently opposite course, and to reject as absolutely false everything as to which I could imagine the least ground of doubt, in order to see if afterwards there remained anything in my belief that was entirely certain. Thus, because our senses sometimes deceive us, I wished to suppose that nothing is just as they cause us to imagine it to be; and because there are men who deceive themselves in their reasoning and fall into paralogisms, even concerning the simplest matters of geometry, and judging that I was as subject to error as was any other, I rejected as false all the reasons formerly accepted by me as demonstrations. And since all the same thoughts and conceptions which we have while awake may also come to us in sleep, without any of them being at that time true, I resolved to assume that everything that ever entered into my mind was no more true than the illusions of my dreams. But immediately afterwards I noticed that whilst I thus wished to think all things false, it was absolutely essential that the "I" who thought this should be somewhat, and remarking that this truth "<I think, therefore I am>" was so certain and so assured that all the most extravagant suppositions brought forward by the skeptics were incapable of shaking it, I came to the conclusion that I could receive it without scruple as the first principle of the Philosophy for which I was seeking.

And then, examining attentively that which I was, I saw that I could conceive that I had no body, and that there was no world nor place where I might be; but yet that I could not for all that conceive that I was not. On the contrary, I saw from the very fact that I thought of doubting the truth of other things, it very evidently and certainly followed that I was; on the other hand if I had only ceased from

thinking, even if all the rest of what I had ever imagined had really existed, I should have no reason for thinking that I had existed. From that I knew that I was a substance the whole essence or nature of which is to think, and that for its existence there is no need of any place, nor does it depend on any material thing; so that this "me," that is to say, the soul by which I am what I am, is entirely distinct from body, and is even more easy to know than is the latter; and even if body were not, the soul would not cease to be what it is.

After this I considered generally what in a proposition is requisite in order to be true and certain; for since I had just discovered one which I knew to be such, I thought that I ought {102} also to know in what this certainty consisted. And having remarked that there was nothing at all in the statement "<I think, therefore I am>" which assures me of having thereby made a true assertion, excepting that I see very clearly that to think it is necessary to be, I came to the conclusion that I might assume, as a general rule, that the things which we conceive very clearly and distinctly are all true-remembering, however, that there is some difficulty in ascertaining which are those that we distinctly conceive.

Following upon this, and reflecting on the fact that I doubted, and that consequently my existence was not quite perfect (for I saw clearly that it was a greater perfection to know than to doubt), I resolved to inquire whence I had learnt to think of anything more perfect than I myself was; and I recognized very clearly that this conception must proceed from some nature which was really more perfect. As to the thoughts which I had of many other things outside of me, like the heavens, the earth, light, heat, and a thousand others, I had not so much difficulty in knowing whence they came, because, remarking nothing in them which seemed to render them superior to me, I could believe that, if they were true, they were dependencies upon my nature, in so far as it possessed some perfection; and if they were not true, that I held them from naught, that is to say, that they were in me because I had something lacking in my nature. But this could not apply to the idea of a Being more perfect than my own, for to hold it from naught would be manifestly impossible; and because it is no less contradictory to say of the more perfect that it is what results from and depends on the less perfect, than to say that there is something which proceeds from nothing, it was equally impossible that I should hold it from myself. In this way it could but follow that it had been placed in me by a Nature which was really more perfect than mine could be, and which even had within itself all the perfections of which I could form any idea -- that is to say, to put it in a word, which was God. To which I added that since I knew some perfections which I did not possess, I was not the only being in existence (I shall here use freely, if you will allow, the terms of the School); but that there was necessarily some other more perfect Being on which I depended, or from which I acquired all that I had. For if I had existed alone and independent of any others, so that I should have had from myself all that perfection of being in which I participated to however small an extent, I should have been able for the same reason

to have had all the remainder which {103} I knew that I lacked; and thus I myself should have been infinite, eternal, immutable, omniscient, all-powerful, and, finally, I should have all the perfections which I could discern in God. For, in pursuance of the reasonings which I have just carried on, in order to know the nature of God as far as my nature is capable of knowing it, I had only to consider in reference to all these things of which I found some idea in myself, whether it was a perfection to possess them or not. And I was assured that none of those which indicated some imperfection were in Him, but that all else was present; and I saw that doubt, inconstancy, sadness, and such things, could not be in Him considering that I myself should have been glad to be without them. In addition to this, I had ideas of many things which are sensible and corporeal, for, although I might suppose that I was dreaming, and that all that I saw or imagined was false, I could not at the same time deny that the ideas were really in my thoughts. But because I had already recognized very clearly in myself that the nature of the intelligence is distinct from that of the body, and observing that all composition gives evidence of dependency, and that dependency is manifestly an imperfection, I came to the conclusion that it could not be a perfection in God to be composed of these two natures, and that consequently He was not so composed. I judged, however, that if there were any bodies in the world, or even any intelligences or other natures which were not wholly perfect, their existence must depend on His power in such a way that they could not subsist without Him for a single moment.

After that I desired to seek for other truths, and having put before myself the object of the geometricians, which I conceived to be a continuous body, or a space indefinitely extended in length, breadth, height or depth, which was divisible into various parts, and which might have various figures and sizes, and might be moved or transposed in all sorts of ways (for all this the geometricians suppose to be in the object of their contemplation), I went through some of their simplest demonstrations, and having noticed that this great certainty which everyone attributes to these demonstrations is founded solely on the fact that they are conceived of with clearness, in accordance with the rule which I have just laid down, I also noticed that there was nothing at all in them to assure me of the existence of their object. For, to take an example, I saw very well that if we suppose a triangle to be given, the three angles must certainly be equal to two right angles; but for all that I saw no {104} reason to be assured that there was any such triangle in existence, while on the contrary, on reverting to the examination of the idea which I had of a Perfect Being, I found that in this case existence was implied in it in the same manner in which the equality of its three angles to two right angles is implied in the idea of a triangle; or in the idea of a sphere, that all the points on its surface are equidistant from its center, or even more evidently still. Consequently it is at least as certain that God, who is a Being, so perfect, is, or exists, as any demonstration of geometry can possibly be.

What causes many, however, to persuade themselves that

there is difficulty in knowing this truth, and even in knowing the nature of their soul, is the fact that they never raise their minds above the things of sense, or that they are so accustomed to consider nothing excepting by imagining it, which is a mode of thought specially adapted to material objects, that all that is not capable of being imagined appears to them not to be intelligible at all. This is manifest enough from the fact that even the philosophers in the Schools hold it as a maxim that there is -nothing in the understanding which has not first of all been in the senses, in which there is certainly no doubt that the ideas of God and of the soul have never been. And it seems to me that those who desire to make use of their imagination in order to understand these ideas, act in the same way as if, to hear sounds or smell odors, they should wish to make use of their eyes: excepting that there is indeed this difference, that the sense of sight does not give us less assurance of the truth of its objects, than do those of seeing or of hearing, while neither our imagination nor our senses can ever assure us of anything, if our understanding does not intervene.

If there are finally any persons who are not sufficiently persuaded of the existence of God and of their soul by the reasons which I have brought forward, I wish that they should know that all other things of which they perhaps think themselves more assured (such as possessing a body, and that there are stars and an earth and so on) are less certain. For, although we have a moral assurance of these things which is such that it seems that it would be extravagant in us to doubt them, at the same time no one, unless he is devoid of reason, can deny, when a metaphysical certainty is in question, that there is sufficient cause for our not having complete assurance, by observing the fact that when asleep we may similarly imagine that we have another body, and that we see other stars and another earth, without there being anything of the kind. {105} For how do we know that the thoughts that come in dreams are more false than those that we have when we are awake, seeing that often enough the former are not less lively and vivid than the latter? And though the wisest minds may study the matter as much as they will, I do not believe that they will be able to give any sufficient reason for removing this doubt, unless they presuppose the existence of God. For to begin with, that which I have just taken as a rule, that is to say, that all the things that we very clearly and very distinctly conceive of are true, is certain only because God is or exists, and that He is a Perfect Being, and that all that is in us issues from Him. From this it follows that our ideas or notions, which to the extent of their being clear or distinct are ideas of real things issuing from God, cannot but to that extent be true. So that though we often enough have ideas which have an element of falsity, this can only be the case in regard to those which have in them somewhat that is confused or obscure, because in so far as they have this character they participate in negation -that is, they exist in us as confused only because we are not quite perfect. And it is evident that there is no less repugnance in the idea that error or imperfection, inasmuch as it is imperfection, proceeds from God, than there is in the idea of truth or perfection proceeding from naught. But

if we did not know that all that is in us of reality and truth proceeds from a perfect and infinite Being, however clear and distinct were our ideas, we should not have any reason to assure ourselves that they had the perfection of being true.

But after the knowledge of God and of the soul has thus rendered us certain of this rule, it is very easy to understand that the dreams which we imagine in our sleep should not make us in any way doubt the truth of the thoughts which we have when awake. For even if in sleep we had some very distinct idea such as a geometrician might have who discovered some new demonstration, the fact of being asleep would not militate against its truth. And as to the most ordinary error in our dreams, which consists in their representing to us various objects in the same way as do our external senses, it does not matter that this should give us occasion to suspect the truth of such ideas, because we may be likewise often enough deceived in them without our sleeping at all, just as when those who have the jaundice see everything as yellow, or when stars or other bodies which are very remote appear much smaller than they really are. For, finally, whether we are awake or asleep, we {106} should never allow ourselves to be persuaded excepting by the evidence of our Reason. And it must be remarked that I speak of our Reason and not of our imagination nor of our senses; just as though we see the sun very clearly, we should not for that reason judge that it is of the size of which it appears to be; likewise we could quite well distinctly imagine the head of a lion on the body of a goat, without necessarily concluding that a chimera exists. For Reason does not insist that whatever we see or imagine thus is a truth, but it tells us clearly that all our ideas or notions must have some foundation of truth. For otherwise it could not be possible that God, who is all perfection and truth, should have placed them within us. And because our reasonings are never so evident nor so complete during sleep as during wakefulness, although sometimes our imaginations are then just as lively and acute, or even more so, Reason tells us that since our thoughts cannot possibly be all true, because we are not altogether perfect, that which they have of truth must infallibly be met with in our waking experience rather than in that of our dreams.

PART V.

I should be very glad to proceed to show forth the complete chain of truths which I have deduced from these first, but because to do this it would have been necessary now to speak of many matters of dispute among the learned, with whom I have no desire to embroil myself, I think that it will be better to abstain. I shall only state generally what these truths are, so that it may be left to the decision of those best able to judge whether it would be of use for the public to be more particularly informed of them or not. I always remained firm in the resolution which I had made, Dot to assume any other principle than that of which I have just made use, in order to demonstrate the existence of God and of the Soul, and to accept nothing as true which did not appear to be more clear and more certain than the demonstrations of the geometricians had formerly seemed. And

nevertheless I venture to say that not only have I found the means of satisfying myself in a short time as to the more important of those difficulties usually dealt with iii philosophy, but I have also observed certain laws which God has so established in Nature, and of which He has imprinted such ideas on our minds, that,, after having reflected sufficiently upon the matter, we cannot doubt their being accurately observed in all that exists or is done in the world. Further, in considering the sequence {107} of these laws, it seems to me that I leave discovered many truth,-, more useful and more important than all that I had formerly learned or even hoped to learn.

But because I tried to explain the most important of these in a Treatise[5] which certain considerations prevented me from publishing, I cannot do better, in making them known, than here summarize briefly what that Treatise contains. I had planned to comprise in it all that I believed myself to know regarding the nature of material objects, before I set myself to write. However, just as the painters who cannot represent equally well on a plain surface all the various sides of a solid body, make selection of one of the most important, which alone is set in the light, while the others are put in shadow and made to appear only as they may be seen in looking at the former, so, fearing that I could not put in my Treatise all that I had in my mind, I undertook only to show very fully my conceptions of light, Later on, when occasion occurred, I resolved to add something about the sun and fixed stars, because light proceeds almost entirely from them; the heavens would be dealt with because they transmit light, the planets, the comets and the earth because they reflect it, and more particularly would all bodies which are on the earth, because they are either colored or transparent, or else luminous; and finally I should deal with man because he is the spectator of all. For the very purpose of putting all these topics somewhat in shadow, and being able to express myself freely about them, without being obliged to adopt or to refute the opinions which are accepted by the learned, I resolved to leave all this world to their disputes, and to speak only of what would happen in a new world if God now created, somewhere in an imaginary space, matter sufficient where-with to form it, and if He agitated in diverse ways, and without any order, the diverse portions of this matter, so that there resulted a chaos as confused as the poets ever feigned, and concluded His work by merely lending His concurrence to Nature in the usual way, leaving her to act in accordance with the laws which He had established. So, to begin with, I described this matter and tried to represent it in such a way, that it seems to me that nothing in the world could be more clear or intelligible, excepting what has just been said of God and the Soul. For I even went so far as expressly to assume that there was in it none of these forms or qualities which are so debated in the Schools, nor anything at all the {108} knowledge of which is not so natural to our minds that none could even pretend to be ignorant of it. Further I pointed out what are the laws of Nature, and, without resting my reasons on any other principle than the infinite perfections of God, I tried to demonstrate all those of which one could have any doubt, and to show that they are of such a nature that even if God had

created other worlds, He could not have created any in which these laws would fail to be. observed. After that, I showed how the greatest part of the matter of which this chaos is constituted, must, in accordance with these laws, dispose and arrange itself in such a fashion as to render it similar to our heavens; and how meantime some of its parts must form an earth, some planets and comets, and some others a sun and fixed stars. And, enlarging on the subject of light, I here explained at length the nature of the light which would be found in the sun and stars, and how from these it crossed in an instant the immense space of the heavens, and how it was reflected from the planets and comets to the earth. To this I also added many things touching the substance, situation, movements, and all the different qualities of these heavens and stars, so that I thought I had said enough to make it clear that there is nothing to be seen in the heavens and stars pertaining to our system which must not, or at least may not, appear exactly the same in those of the system which I described. From this point I came to speak more particularly of the earth, showing how, though I had expressly presupposed that God had not placed any weight in the matter of which it is composed, its parts did not fail all to gravitate exactly to its center; and how, having water and air on its surface, the disposition of the heavens and of the stars, more particularly of the moon, must cause a flux or reflux, which in all its circumstances is similar to that which is observed in our seas, and besides that, a certain current both of water and air from east to west, such as may also be observed in the tropics. I also showed how the mountains, seas, fountains and rivers, could naturally be formed in it, how the metals came to be in the mines and the plants to grow in the fields; and generally how all bodies, called mixed or composite, might arise. And because I knew nothing but fire which could produce light, excepting the stars, I studied amongst other things to make very clear all that pertains to its nature, how it is formed, how nourished, how there is sometimes only heat without light, and sometimes light without heat; I showed, too, how different colors might by it be induced upon different bodies and qualities of diverse kinds, how {109} some of these were liquefied and others solidified, bow nearly all can be consumed or converted into ashes and smoke by its means, and finally how of these ashes, by the intensity of its action alone, it forms glass. Since this transformation of ashes into glass seemed to me as wonderful as any other process in nature, I took particular pleasure in describing it.

I did not at the same time wish to infer from all these facts that this world has been created in the manner which I described; for it is much more probable that at the beginning God made it such as it was to be. But it is certain, and it is an opinion commonly received by the theologians, that the action by which He now preserves it is just the same as that by which He at first created it. In this way, although He had not, to begin with, given this world any other form than that of chaos, provided that the laws of nature had once been established and that He had lent His aid in order that its action should be according to its wont, we may well believe, without doing outrage to the miracle of creation, that by this means alone all things

which are purely material might in course of time have become such as we observe them to be at present; and their nature is much easier to understand when we see them coming to pass little by little in this manner, than were we to consider them as all complete to begin with.

From a description of inanimate bodies and plants I passed on to that of animals, and particularly to that of men. But since I had not yet sufficient knowledge to speak of them in the same style as of the rest, that is to say, demonstrating the effects from the causes, and showing from what beginnings and in what fashion Nature must produce them, I contented myself with supposing that God formed the body of man altogether like one of ours, in the outward figure of its members as well as in the interior conformation of its organs, without making use of any matter other than that which I had described, and without at the first placing in it a rational soul, or any other thing which might serve as a vegetative or as a sensitive soul; excepting that He kindled in the heart one of these fires without light, which I have already described, and which I did not conceive of as in any way different from that which makes the hay heat when shut up before it is dry, and which makes new wine grow frothy when it is left to ferment over the fruit. For, examining the functions which might in accordance with this supposition exist in this body, I found precisely all those which might exist in us without our having the power of thought, and consequently {110} without our soul-that is to say, this part of us, distinct from the body, of which it has just been said that its nature is to think-contributing to it, functions which are identically the same as those in which animals lacking reason may be said to resemble us. For all that, I could not find in these functions any which, being dependent on thought, pertain to us alone, inasmuch as we are men; while I found all of them afterwards, when I assumed that God had created a rational soul and that He had united it to this body in a particular manner which I described.

But in order to show how I there treated of this matter, I wish here to set forth the explanation of the movement of heart and arteries which, being the first and most general movement that is observed in animals, will give us the means of easily judging as to what we ought to think about all the rest. And so that there may be less difficulty in understanding what I shall say on this matter, I should like that those not versed in anatomy should take the trouble, before reading this, of having out up before their eyes the heart of some large animal which has lungs (for it is in all respects sufficiently similar to the heart of a man), and cause that there be demonstrated to them the two chambers or cavities which are within it. There is first of all that which is on the right side, with which two very large tubes or channels correspond, viz. the <vena cava>, which is the principal receptacle of the blood, and so to speak the trunk of a tree of which all the other veins of the body are the branches; and there is the arterial vein which has been badly named because it is nothing but an artery which, taking its origin from the heart, divides, after having issued from it, into many branches which proceed to disperse themselves all through the lungs. Then

there is secondly the cavity on the left side with which there again correspond two tubes which are as large or larger than the preceding, viz. the venous artery, which has also been badly named, because it is nothing but a vein which comes from the lungs, where it is divided into many branches, interlaced with those of the arterial vein, and with those of the tube which is called the windpipe, through which enters the air which we breathe; and the great artery which, issuing from the heart, sends its branches throughout the body. I should also wish that the eleven little membranes, which, like so many doors, open and shut the four entrances which are in these two cavities, should be carefully shown. There are of these three at the entrance of the <vena cava>, where they are so arranged that they can in nowise prevent the blood which it contains {111} from flowing into the right cavity of the heart and yet exactly prevent its issuing out; there are three at the entrance to the arterial vein, which, being arranged quite the other way, easily allow the blood which is in this cavity to pass into the lungs, but not that which is already in the lungs to return to this cavity. There are also two others at the entrance of the venous artery, which allow the blood in the lungs to flow towards the left cavity of the heart, but do not permit its return; and three at the entrance of the great artery, which allow the blood to flow from the heart, but prevent its return. There is then no cause to seek for any other reason for the number of these membranes, except that the opening of the venous artery being oval, because of the situation where it is met with, may be conveniently closed with two membranes, while the others, being round, can be better closed with three. Further, I should have my readers consider that the grand artery and the arterial vein are much harder and firmer than are the venous artery and the <vena cava>; and that these two last expand before entering the heart, and there form so to speak two pockets called the auricles of the heart, which are composed of a tissue similar to its own; and also that there is always more heat in the heart than in any other part of the body; and finally that this heat is capable of causing any drop of blood that enters into its cavities promptly to expand and dilate, as liquids usually do when they are allowed to fall drop by drop into some very hot vessel.

After this I do not need to say anything with a view to explaining the movement of the heart, except that when its cavities are not full of blood there necessarily flows from the <vena cava> into the right cavity, and from the venous artery into the left, enough blood to keep these two vessels always full, and being full, that their orifices, which are turned towards the heart, cannot then be closed. But as soon as two drops of blood have thus entered, one into each of the cavities, these drops, which cannot be otherwise than very large, because the openings by which they enter are very wide and the vessels from whence they come are very full of blood, rarefy and dilate because of the heat which they find there. By this means, causing the whole heart to expand, they force home and close the five little doors which are at the entrances of the two vessels whence they flow, thus preventing any more blood from coming down into the heart and becoming more and more rarefied, they push open the six doors which are in the entrances of the two

other vessels through which they make their exit, by this means causing {112} all the branches of the arterial vein and of the great artery to expand almost at the same instant as the heart. This last immediately afterward contracts as do also the arteries, because the blood which has entered them has cooled; and the six little doors close up again, and the five doors of the <vena cava> and of the venous artery re-open and make a way for two other drops of blood which cause the heart and the arteries once more to expand, just as we saw before. And because the blood which then enters the heart passes through these two pouches which are called auricles, it comes to pass that their movement is contrary to the movement of the heart, and that they contract when it expands. For the rest, in order that those who do not know the force of mathematical demonstration and are unaccustomed to distinguish true reasons from merely probable reasons, should not venture to deny what has been said without examination, I wish to acquaint them with the fact that this movement which I have just explained follows as necessarily from the very disposition of the organs, as can be seen by looking at the heart, and from the heat which can be felt with the fingers, and from the nature of the blood of which we can learn by experience, as does that of a clock from the power, the situation, and the form, of its counterpoise and of its wheels.

But if we ask how the blood in the veins does not exhaust itself in thus flowing continually into the heart, and how the arteries do not become too full of blood, since all that passes through the heart flows into them, I need only reply by stating what has already been written by an English physician,[6] to whom the credit of having broken the ice in this matter must be ascribed, as also of being the first to teach that there are many little tubes at the extremities of the arteries whereby the blood that they receive from the heart enters the little branches of the veins, whence it returns once more to the heart; in this way its course is just a perpetual circulation. He proves this very clearly by the common experience of surgeons, who, by binding the arm moderately firmly above the place where they open the vein, cause the blood to issue more abundantly than it would have done if they had not bound it at all; while quite a contrary result would occur if they bound it below, between the hand and the opening, or if they bound it very firmly above. For it is clear that when the bandage is moderately tight, though it may prevent the blood already in the arm from {113} returning to the heart by the Veins, it cannot for all that prevent more blood from coming anew by the arteries, because these are situated below the veins, and their walls, being stronger, are less easy to compress; and also that the blood which comes from the heart tends to pass by means of the arteries to the band with greater force than it does to return from the band to the heart by the veins. And because this blood escapes from the arm by the opening which is made in one of the veins, there must necessarily be some passages below the ligature, that is to say, towards the extremities of the arm, through which it can come thither from the arteries. This physician likewise proves very clearly the truth of that which he says of the course of the blood, by the existence of certain little membranes or valves which are so arranged in different

places along the course of the veins, that they do not permit the blood to pass from the middle of the body towards the extremities, but only to return from the extremities to the heart; and further by the experiment which shows that all the blood which is in the body may issue from it in a very short time by means of one single artery that has been cut, and this is so even when it is very tightly bound very near the heart, and cut between it and the ligature, so that there could be no ground for supposing that the blood which flowed out of it could proceed from any other place but the heart.

But there are many other things which demonstrate that the true cause of this motion of the blood is that which I have stated. To begin with, the difference which is seen between the blood which issues from the veins, and that which issues from the arteries, can only proceed from the fact, that, being rarefied, and so to speak distilled by passing through the heart, it is more subtle and lively, and warmer immediately after leaving the heart (that is to say, when in the arteries) than it is a little while before entering it (that is, when in the veins). And if attention be paid, we shall find that this difference does not appear clearly, excepting in the vicinity of the heart, and is not so clear in those parts which are further removed from it. Further, the consistency of,he coverings of which the arterial vein and the great artery are composed, shows clearly enough that the blood beats against them with more force than it does in the case of the veins. And why should the left cavity of the heart and the great artery be larger and wider than the right cavity and the arterial vein, if it is not that the blood of the venous artery having only been in the lungs since it had passed through the heart, is more subtle and rarefies more effectively and {114} easily than that which proceeds immediately from the <vena cava>? And what is it that the physicians can discover in feeling the pulse, unless they know that, according as the blood changes its nature, it may be rarefied by the warmth of the heart in a greater or less degree, and more or less quickly than before ? And if we inquire how this heat is communicated to the other members, must it not be allowed that it is by means of the blood which, passing through the heart, is heated once again and thence is spread throughout all the body? From this it happens that if we take away the blood from any particular part, by that same means we take away from it the heat; even if the heart were as ardent as a red hot iron it would not suffice to heat up the feet and hands as it actually does, unless it continually sent out to them new blood. We further understand from this that the true use of respiration is to carry sufficient fresh air into the lungs to cause the blood, which comes there from the right cavity of the heart, where it has been rarefied and so to speak transformed into vapors, to thicken, and become anew converted into blood before falling into the left cavity, without which process it would not be fit to serve as fuel for the fire which there exists. We are confirmed in this statement by seeing that the animals which have no lungs have also but one cavity in their hearts, and that in children, who cannot use them while still within their mother's wombs, there is an opening by which the blood flows from the <vena cava> into the left cavity of the heart, and

a conduit through which it passes from the arterial vein into the great artery without passing through the lung. Again, how could digestion be carried on in the stomach if the heart did not send heat there by the arteries, and along with this some of the more fluid parts of the blood which aid in dissolving the foods which have been there placed? And is not the action which converts the juice of foods into blood easy to understand if we consider that it is distilled by passing and repassing through the heart possibly more than one or two hundred times in a day? What further need is there to explain the process of nutrition and the production of the different humors which are in the body, if we can say that the force with which the blood, in being rarefied, passes from the heart towards the extremities of the arteries, causes some of its parts to remain among those of the members where they are found and there to take the place of others which they oust; and that according to the situation or form or smallness of the little pores which they encounter, certain ones proceed to certain parts rather than others, just as {115} a number of different sieves variously perforated, as everyone has probably seen, are capable of separating different species of grain? And finally what in all this is most remarkable of all, is the generation of the animal spirits, which resemble a very subtle wind, or rather a flame which is very pure and very vivid, and which, continually rising Up in great abundance from the heart to the brain, thence proceeds through the nerves to the muscles, thereby giving the power of motion to all the members. And it is Dot necessary to suppose any other cause to explain how the particles of blood, which, being most agitated and most penetrating, are the most proper to constitute these spirits, proceed towards the brain rather than elsewhere, than that the arteries which carry them thither are those which proceed from the heart in the most direct lines, and that according to the laws of Mechanics, which are identical with those of Nature, when many objects tend to move together to the same point, where there is not room for all (as is the case with the particles of blood which issue from the left cavity of the heart and tend to go towards the brain), the weakest and least agitated parts must necessarily be turned aside by those that are stronger, which by this means are the only ones to reach it.

I had explained all these matters in some detail in the Treatise which I formerly intended to publish. And afterwards I had shown there, what must be the fabric of the nerves and muscles of the human body in order that the animal spirits therein contained should have the power to move the members, just as the heads of animals, a little while after decapitation, are still observed to move and bite the earth, notwithstanding that they are no longer animate; what changes are necessary in the brain to cause wakefulness, sleep and dreams; how light, sounds, smells, tastes, heat and all other qualities pertaining to external objects are able to imprint on it various ideas by the intervention of the senses; how hunger, thirst and other internal affections can also convey their impressions upon it; what should be regarded as the "common sense" by which these ideas are received, and what is meant by the memory which retains them, by the fancy which can change them in

diverse ways and out of them constitute new ideas, and which, by the same means, distributing the animal spirits through the muscles, can cause the members of such a body to move in as many diverse ways, and in a manner as suitable to the objects which present themselves to its senses and to its internal passions, as can happen in our own case apart from the direction of our free will. And this will not seem strange {116} to those, who, knowing how many different automata or moving machines can be made by the industry of man, without employing in so doing more than a very few parts in comparison with the great multitude of bones, muscles, nerves, arteries, veins, or other parts that are found in the body of each animal. From this aspect the body is regarded as a machine which, having been made by the hands of God, is incomparably better arranged, and possesses in itself movements which are much more admirable, than any of those which can be invented by man. Here I specially stopped to show that if there had been such machines, possessing the organs and outward form of a monkey or some other animal without reason, we should not have had any means of ascertaining that they were not of the same nature as those animals. On the other hand, if there were machines which bore a resemblance to our body and imitated our actions as far as it was morally possible to do so, we should always have two very certain tests by which to recognize that, for all that, they were not real men. The first is, that they could never use speech or other signs as we do when placing our thoughts on record for the benefit of others. For we can easily understand a machine's being constituted so that it can utter words, and even emit some responses to action on it of a corporeal kind, which brings about a change in its organs; for instance, if it is touched in a particular part it may ask what we wish to say to it; if in another part it may exclaim that it is being hurt, and so on. But it never happens that it arranges its speech in various ways, in order to reply appropriately to everything that may be said in its presence, as even the lowest type of man can do. And the second difference is, that although machines can perform certain things as well as or perhaps better than any of us can do, they infallibly fan short in others, by the which means we may discover that they did not act from knowledge, but only from the disposition of their organs. For while reason is a universal instrument which can serve for all contingencies, these organs have need of some special adaptation for every particular action. From this it follows that it is morally impossible that there should be sufficient diversity in any machine to allow it to act in all the events of life in the same way as our reason causes us to act.

By these two methods we may also recognize the difference that exists between men and brutes. For it is a very remarkable fact that there are none so depraved and stupid, without even excepting idiots, that they cannot arrange different words together, {117} forming of them a statement by which they make known their thoughts; while, on the other hand, there is no other animal, however perfect and fortunately circumstanced it may be, which can do the same. It is not the want of organs that brings this to pass, for it is evident that ma.-Pies and parrots are able to utter words just like ourselves, and yet they cannot speak

as we do, that is, so as to give evidence that they think of what they say. On the other hand, men who, being born deaf and dumb, are in the same degree, or even more than the brutes, destitute of the organs which serve the others for talking, are in the habit of themselves investing certain signs by which they make themselves understood by those who, being usually in their company, have leisure to learn their language. And this does not merely show that the brutes have less reason than men, but that they have none at all, since it is clear that very little is required in order to be able to talk. And when we notice the inequality that exists between animals of the same species, as well as between men, and observe that some are more capable of receiving instruction than others, it is not credible that a monkey or a parrot, selected as the most perfect of its species, should not in these matters equal the stupidest child to be found, or at least a child whose mind is clouded, unless in the case of the brute the soul were of an entirely different nature from ours. And we ought not to confound speech with natural movements which betray passions and may be imitated by machines as well as be manifested by animals; nor must we think, as did some of the ancients, that brutes talk, although we do not understand their language. For if this were true, since they have many organs which are allied to our own, they could communicate their thoughts to us just as easily as to those of their own race. It is also a very remarkable fact that although there are many animals which exhibit more dexterity than we do in some of their actions, we at the same time observe that they do not manifest any dexterity at all in many others. Hence the fact that they do better than we do, does not prove that they are endowed with mind, for in this case they would have more reason than any of us, and would surpass us in all other things. It rather shows that they have no reason at all, and that it is nature which acts in them according to the disposition of their organs, just as a clock, which is only composed of wheels and weights is able to tell the hours and measure the time more correctly than we can do with all our wisdom.

I had described after this the rational soul and shown that it {118} could not be in any way derived from the power of matter, like the other things of which I had spoken, but that it must be expressly created. I showed, too, that it is not sufficient that it should be lodged in the human body like a pilot in his ship, unless perhaps for the moving of its members, but that it is necessary that it should also be joined and united more closely to the body in order to have sensations and appetites similar to our own, and thus to form a true man. In conclusion, I have here enlarged a little on the subject of the soul, because it is one of the greatest importance. For next to the error of those who deny God, which I think I have already sufficiently refuted, there is none which is more effectual in leading feeble spirits from the straight path of virtue, than to imagine that the soul of the brute is of the same nature as our own, and that in consequence, after this life we have nothing to fear or to hope for, any more than the flies and ants. As a matter of fact, when one comes to know how greatly they differ, we understand much better the reasons which go to prove that our soul is in its nature entirely independent of body, and in consequence that it is not liable to die with

it. And then, inasmuch as we observe no other causes capable of destroying it, we are naturally inclined to judge that it is immortal.

PART VI.

It is three years since I arrived at the end of the Treatise which contained all these things; and I was commencing to revise it in order to place it in the hands of a printer, when I learned that certain persons, to whose opinions I defer, and whose authority cannot have less weight with my actions than my own reason has over my thoughts, had disapproved of a physical theory published a little while before by another person.[7] I will not say that I agreed with this opinion, but only that before their censure I observed in it nothing which I could possibly imagine to be prejudicial either to Religion or the State, or consequently which could have prevented me from giving expression to it in writing, if my reason had persuaded me to do so: and this made me fear that among my own opinions one might be found which should be misunderstood, notwithstanding the great care which I have always taken not to accept any new beliefs unless I had very certain proof of their truth, and not to give expression to what could tend to the disadvantage {119} of any person. This sufficed to cause me to alter the resolution which I had made to publish. For, although the reasons for my former resolution were very strong, my inclination, which always made me hate the profession of writing books, caused me immediately to find plenty of other reasons for excusing myself from doing so. And these reasons, on the one side and on the other, are of such a nature that not only have I here some interest in giving expression to them, but possibly the public may also have some interest in knowing them.

I have never made much of those things which proceed from my own mind, and so long as I culled Do other fruits from the Method which I use, beyond that of satisfying myself respecting certain difficulties which pertain to the speculative sciences, or trying to regulate my conduct by the reasons which it has taught me, I never believed myself to be obliged to write anything about it. For as regards that which concerns conduct, everyone is so confident of his own common sense, that there might be found as many reformers as heads, if it were permitted that others than those whom God has established as the sovereigns of his people, or at least to whom He has given sufficient grace and zeal to be prophets, should be allowed to make any changes in that. And, although my speculations give me the greatest pleasure, I believed that others also had speculations which possibly pleased them even more. But so soon as I had acquired some general notions concerning Physics, and as, beginning to make use of them in various special difficulties, I observed to what point they might lead us, and how much they differ from the principles of which we have made use up to the present time, I believed that I could not keep them concealed without greatly sinning against the law which obliges us to procure, as much as in us lies, the general good of all mankind. For they caused me to see that it is possible to attain knowledge which is very useful in life, and that, instead of that speculative

philosophy which is taught in the Schools, we may find a practical philosophy by means of which, knowing the force and the action of fire, water, air, the stars, heavens and all other bodies that environ us, as distinctly as we know the different crafts of our artisans, we can in the same way employ them in all those uses to which they are adapted, and thus render ourselves the masters and possessors of nature. This is not merely to be desired with a view to the invention of an infinity of arts and crafts which enable us to enjoy without any trouble the fruits of the earth and all the good things which are to {120} be found there, but also principally because it brings about the preservation of health, which is without doubt the chief blessing and the foundation of all other blessings in this life. For the mind depends so much on the temperament and disposition of the bodily organs that, if it is possible to find a means of rendering men wiser and cleverer than they have hitherto been, I believe that it is in medicine that it must be sought. It is true that the medicine which is now in vogue contains little of which the utility is remarkable; but, without having any intention of decrying it, I am sure that there is no one, even among those who make its study a profession, who does not confess that all that men know is almost nothing in comparison with what remains to be known; and that we could be free of an infinitude of maladies both of body and mind, and even also possibly of the infirmities of age, if we had sufficient knowledge of their causes, and of all the remedies with which nature has provided us. But, having the intention of devoting all my life to the investigation of a knowledge which is so essential, and having discovered a path which appears to me to be of such a nature that we must by its means infallibly reach our end if we pursue it, unless, indeed, we are prevented by the shortness of life or by lack of experience, I judged that there was no better provision against these two impediments than faithfully to communicate to the public the little which I should myself have discovered, and to beg all well-inclined persons to proceed further by contributing, each one according to his own inclination and ability, to the experiments which must be made, and then to communicate to the public all the things which they might discover, in order that the last should commence where the preceding had left off; and thus, by joining together the lives and labors of many, we should collectively proceed much further than any one in particular could succeed in doing.

I remarked also respecting experiments, that they become so much the more necessary the more one is advanced in knowledge, for to begin with it is better to make use simply of those which present themselves spontaneously to our senses, and of which we could not be ignorant provided that we reflected ever so little, rather than to seek out those which are more rare and recondite; the reason of this is that those which are more rare often mislead us so long as we do not know the causes of the more common, and the fact that the circumstances on which they depend are almost always so particular and so minute that it is very difficult to observe {121} them. But in this the order which I have followed is as follows: I have first tried to discover generally the principles or first causes of everything that is or that can be in the world, without considering anything

that might accomplish this end but God Himself who has created the world, or deriving them from any source excepting from certain germs of truths which are naturally existent in our souls. After that I considered which were the primary and most ordinary effects which might be deduced from these causes, and it seems to me that in this way I discovered the heavens, the stars, an earth, and even on the earth, water, air, fire, the minerals and some other such things, which are the most common and simple of any that exist, and consequently the easiest to know. Then, when I wished to descend to those which were more particular, so many objects of various kinds presented themselves to me, that I did not think it was possible for the human mind to distinguish the forms or species of bodies which are on the earth from an infinitude of others which might have been so if it had been the will of God to place them there, or consequently to apply them to our use, if it were not that we arrive at the causes by the effects, and avail ourselves of many particular experiments. In subsequently passing over in my mind all the objects which have ever been presented to my senses, I can truly venture to say that I have not there observed anything which I could not easily explain by the principles which I had discovered. But I must also confess that the power of nature is so ample and so vast, and these principles are so simple and general, that I observed hardly any particular effect as to which I could not at once recognize that it might be deduced from the principles in many different ways; and my greatest difficulty is usually to discover in which of these ways the effect does depend upon them. As to that, I do not know any other plan but again to try to find experiments of such a nature that their result is not the same if it has to be explained by one of the methods, as it would be if explained by the other. For the rest, I have now reached a position in which I discern, as it seems to me, sufficiently clearly what course must be adopted in order to make the majority of the experiments which may conduce to carry out this end. But I also perceive that they are of such a nature, and of so great a number, that neither my hands nor my income, though the latter were a thousand times larger than it is, could suffice for the whole; so that just in proportion as henceforth I shall have the power of carrying out more of them or less, shall I make more or less progress in arriving at a knowledge {122} of nature. This is what I had promised myself to make known by the Treatise which I had written, and to demonstrate in it so clearly the advantage which the public might receive from it, that I should induce all those who have the good of mankind at heart-that is to say, all those who are really virtuous in fact, and not only by a false semblance or by opinion-both to communicate to me those experiments that they have already carried out, and to help me in the investigation of those that still remain to be accomplished.

But I have since that time found other reasons which caused me to change my opinion, and consider that I should indeed continue to put in writing all the things which I judged to be of importance whenever I discovered them to be true, and that I should bestow on them the same care as I should have done had I wished to have them printed. I did this because it would give me so much the more occasion to examine them carefully (for there is no doubt that we always

scrutinize more closely what we think will be seen by many, than what is done simply for ourselves, and often the things which have seemed true to me when I began to think about them, seemed false when I tried to place them on paper); and because I did not desire to lose any opportunity of benefiting the public if I were able to do so, and in order that if my works have any value, those into whose hands they will fall after my death, might have the power of making use of them as seems best to them. I, however, resolved that I should not consent to their being published during my lifetime, so that neither the contradictions and controversies to which they might possibly give rise, nor even the reputation, such as it might be, which they would bring to me, should give me any occasion to lose the time which I meant to set apart for my own instruction. For although it is true that each man is obliged to procure, as much as in him lies, the good of others, and that to be useful to nobody is popularly speaking to be worthless, it is at the same time true that our cares should extend further than the present time, and that it is good to set aside those things which may possibly be adapted to bring profit to the living, when we have in view the accomplishment of other ends which will bring much more advantage to our descendants. In the same wry I should much like that men should know that the little which I have learned hitherto is almost nothing in comparison with that of which I am ignorant, and with the knowledge of which I do not despair of being able to attain. For it is much the same with those who little by little discover the truth in the Sciences, as with those who, {123} commencing to become rich, have less trouble in obtaining great acquisitions than they formerly experienced, when poorer, in arriving at those much smaller in amount. Or we might compare them to the Generals of our armies, whose forces usually grow ill proportion to their victories, and who require more leadership in order to hold together their troops after the loss of a battle, than is needed to take towns and provinces after having obtained a success. For he really gives battle who attempts to conquer all the difficulties and errors which prevent him from arriving at a knowledge of the truth, and it is to lose a battle to admit a false opinion touching a matter of any generality and importance. Much more skill is required in order to recover the position that one beforehand held, than is necessary to make great progress when one already possesses principles which are assured. For myself, if I have succeeded in discovering certain truths in the Sciences (and I hope that the matters contained in this volume will show that I have discovered some), I may say that they are resultant from, and dependent on, five or six principal difficulties which I have surmounted, and my encounter with these I look upon as so many battles in which I have had fortune on my side. I will not even hesitate to say that I think I shall have no need to win more than two or three other victories similar in kind in order to reach the accomplishment of my plans. And my age is not so advanced but that, in the ordinary course of nature, I may still have sufficient leisure for this end. But I believe myself to be so much the more bound to make the most of the time which remains, as I have the greater hope of being able to employ it well. And without doubt I should have many chances of being robbed of it, were I to publish the

foundations of my Physics; for though these are nearly all so evident that it is only necessary to understand them in order to accept them, and although there are none of them as to which I do not believe myself capable of giving demonstration, yet because it is impossible that they should accord with all the various opinions of other men, I foresee that I should often be diverted from my main design by the opposition which they would bring to birth.

We may say that these contradictions might be useful both in making me aware of my errors, and, supposing that I had reached some satisfactory conclusion in bringing others to a fuller understanding of my speculations; and, as many can see more than can a single man, they might help in leading others who from the present time may begin to avail themselves of my system, to assist {124} me likewise with their discoveries. But though I recognize that I am extremely liable to err, and though I almost never trust the first reflections that I arrive at, the experience which I have had of the objections which may be made to my system prevents my having any hope of deriving profit from them. For I have often had experience of the judgments both of those whom I have esteemed as my friends, and of some others to whom I believed myself to be indifferent, and even, too, of some whose ill-feeling and envy would, I felt sure, make them endeavor to reveal what affection concealed from the eyes of my friends. But rarely has it happened that any objection has been made which I did not in some sort foresee, unless where it was something very far removed from my subject. In this way hardly ever have I encountered any censor of my opinions who did not appear to me to be either less rigorous or less judicial than myself. And I certainly never remarked that by means of disputations employed by the Schools any truth has been discovered of which we were formerly ignorant. And so long as each side attempts to vanquish his opponent, there is a much more serious attempt to establish probability than to weigh the reasons on either side; and those who have for long been excellent pleaders are not for that reason the best judges.

As to the advantage which others may receive from the communication of my reflections, it could not be very great, inasmuch as I have not yet carried them so far as that it is not necessary to add many things before they can be brought into practice. And I think I can without vanity say that if anyone is capable of doing this, it should be myself rather than another-not indeed that there may not be in the world many minds incomparably superior to my own, but because no one can so well understand a thing and make it his own when learnt from another as when it is discovered for himself. As regards the matter in hand there is so much truth in this, that although I have often explained some of my opinions to persons of very good intelligence, who, while I talked to them appeared to understand them very clearly, yet when they recounted them I remarked that they had almost always altered them in such a manner that I could no longer acknowledge them as mine. On this account I am very glad to have the opportunity here of begging my descendants never to believe that what is told to them proceeded from myself unless I have myself divulged it. And I do not in the least wonder at the extravagances attributed to all the ancient

philosophers whose writings we do not possess, nor do I judge from {125} these that their thoughts were very unreasonable, considering that theirs were the best minds of the time they lived in, but only that they have been imperfectly represented to us. We see, too, that it hardly ever happens that any of their disciples surpassed them, and I am sure that those who most passionately follow Aristotle now-a-days would think themselves happy if they had as much knowledge of nature as he had, even if this were on the condition that they should never attain to any more. They are like the ivy that never tries to mount above the trees which give it support, and which often even descends again after it has reached their summit; for it appears to me that such men also sink again-that is to say, somehow render themselves more ignorant than they would have been had they abstained from study altogether. For, not content with knowing all that is intelligibly explained in their author, they wish in addition to find in him the solution of many difficulties of which he says nothing, and in regard to which he possibly had no thought at all. At the same time their mode of philosophizing is very convenient for those who have abilities of a very mediocre kind, for the obscurity of the distinctions and principles of which they make use, is the reason of their being able to talk of all things as boldly as though they really knew about them, and defend all that they say against the most subtle and acute, without any one having the means of convincing them to the contrary. In this they seem to me like a blind man who, in order to fight on equal terms with one who sees, would have the latter to come into the bottom of a very dark cave. I may say, too, that it is in the interest of such people that I should abstain from publishing the principles of philosophy of which I make use, for, being so simple and evident as they are, I should, in publishing them, do the same as though I threw open the windows and caused daylight to enter the cave into which they have descended in order to fight. But even the best minds have no reason to desire to be acquainted with these principles, for if they wish to be able to talk of everything and acquire a reputation for learning, they will more readily attain their end by contenting themselves with the appearance of truth which may be found in all sorts of things without much trouble, than in seeking for truth which only reveals itself little by little in certain spheres, and which, when others come into question, obliges one to confess one's ignorance. If, however, they prefer the knowledge of some small amount of truth to the vanity of seeming to be ignorant of nothing, which knowledge is {126} doubtless preferable, or if they desire to follow a course similar to my own, it is not necessary that I should say any more than what I have already said in this Discourse. For if they are capable of passing beyond the point I have reached, they will also so much the more be able to find by themselves all that I believe myself to have discovered; since, not having examined anything but in its order, it is certain that what remains for me to discover is in itself more difficult and more recondite than anything that I have hitherto been able to meet with, and they would have much less pleasure in learning from me than from themselves. Besides, the habit which they will acquire of seeking first things that are simple and then little by little and by degrees passing to

others more difficult, will be of more use than could be all my instructions. For, as regards myself, I am persuaded that if from my youth up I had been taught all the truths of which I have since sought the demonstrations, or if I had not had any difficulty in learning them, I should perhaps never have known any others, or at least I should never have acquired the habit or facility which I think I have obtained, of ever finding them anew, in proportion as I set myself to seek for them. And, in a word, if there is any work at all which cannot be so well achieved by another as by him who has begun it, it is that at which I labor.

It is true as regards the experiments which may conduce to this end, that one man could not possibly accomplish all of them. But yet he could not, to good advantage, employ other hands than his own, excepting those of artisans or persons of that kind whom he could pay, and whom the hope of gain-which is a very effectual incentive-might cause to perform with exactitude all the things they were directed to accomplish. As to those who, whether by curiosity or desire to learn, might possibly offer him their voluntary assistance, not only are they usually more ready with promises than with performance, planning out fine sounding projects, none of which are ever realized, but they will also infallibly demand payment for their trouble by requesting the explanation of certain difficulties, or at least by empty compliments and useless talk, which could not occupy any of the student's time without causing it to be lost. And as to the experiments already made by others, even if they desired to communicate these to him-which those who term them secrets would never do-they are for the most part accompanied by so many circumstances or superfluous matter, that it would be very difficult for him to disentangle the truth. In addition to this he {127} would find nearly all so badly explained, or even so false (because those who carried them out were forced to make them appear to be in conformity with their principles), that if there had been some which might have been of use to him, they would hardly be worth the time that would be required in making the selection. So true is this, that if there were anywhere in the world a person whom one knew to be assuredly capable of discovering matters of the highest importance and those of the greatest possible utility to the public, and if for this reason all other men were eager by every means in their power to help him in reaching the end which he set before him, I do not see that they could do anything for him beyond contributing to defray the expenses of the experiments which might be requisite, or, for the rest, seeing that he was not deprived of his leisure by the importunities of anyone. But, in addition to the fact that I neither esteem myself so highly as to be willing to promise anything extraordinary, nor give scope to an imagination so vain as to conceive that the public should interest itself greatly in my designs, I do not yet own a soul so base as to be willing to accept from anyone whatever a favor which it might be supposed I did not merit.

All those considerations taken together were, three years ago, the cause of my not desiring to publish the Treatise which I had on hand, and the reason why I even formed the resolution of not bringing to light during my

life any other of so general a kind, or one by which the foundations of Physics could be understood. But since then two other reasons came into operation which compelled me to bring forward certain attempts, as I have done here, and to render to the public some account of my actions and designs. The first is that if I failed to do so, many who knew the intention I formerly had of publishing certain writings, might imagine that the causes for which I abstained from so doing were more to my disadvantage than they really were; for although I do not care immoderately for glory, or, if I dare say so, although I even hate it, inasmuch as I judge it to be antagonistic to the repose which I esteem above all other things, at the same time I never tried to conceal my actions as though they were crimes, nor have I used many precautions against being known, partly because I should have thought it damaging to myself, and partly because it would have given me a sort of disquietude which would again have militated against the perfect repose of spirit which I seek. And for as much as having in this way always held myself in a condition of indifference as {128} regards whether I was known or was not known, I have not yet been able to prevent myself from acquiring some sort of reputation, I thought that I should do my best at least to prevent myself from acquiring an evil reputation. The other reason which obliged me to put this in writing is that I am becoming every day more and more alive to t-he delay which is being suffered in the design which I have of instructing myself, because of the lack of an infinitude of experiments, which it is impossible that I should perform without the aid of others: and although I do not flatter myself so much as to hope that the public should to any large degree participate in my interest, I yet do not wish to be found wanting, both on my own account, and as one day giving occasion to those who will survive me of reproaching me for the fact that I might have left many matters in a much better condition than I have done, had I not too much neglected to make them understand in what way they could have contributed to the accomplishment of my designs.

And I thought that it was easy for me to select certain matters which would not be the occasion for many controversies, nor yet oblige me to propound more of my principles than I wish, and which yet would suffice to allow a pretty clear manifestation of what I can do and what I cannot do in the sciences. In this I cannot say whether I have succeeded or have not succeeded, and I do not wish to anticipate the judgment of any one by myself speaking of my writings; but I shall be very glad if they will examine them. And in order that they may have the better opportunity of so doing, I beg all those who have any objections to offer to take the trouble of sending them to my publishers, so that, being made aware of them, I may try at the same time to subjoin my reply. By this means, the reader, seeing objections and reply at the same time, will the more easily judge of the truth; for I do not promise in any instance to make lengthy replies, but just to avow my errors very frankly if I am convinced of them; or, if I cannot perceive them, to say simply what I think requisite for the defense of the matters I have written, without adding the exposition of any new matter, so that I may not be endlessly engaged in passing from one side to the other.

If some of the matters of which I spoke in the beginning of the <Dioptrics> and <Meteors> should at first sight give offense because I call them hypotheses and do not appear to care about their proof, let them have the patience to read these in entirety, and I hope that they will find themselves satisfied. For it appears to me that {129} the reasonings are so mutually interwoven, that as the later ones are demonstrated by the earlier, which are their causes, the earlier are reciprocally demonstrated by the later which are their effects. And it must not be imagined that in this I commit the fallacy which logicians name arguing in a circle, for, since experience renders the greater part of these effects very certain, the causes from which I deduce them do not so much serve to prove their existence as to explain them; on the other hand, the causes are explained by the effects. And I have not named them hypotheses with any other object than that it may be known that while I consider myself able to deduce them from the primary truths which I explained above, yet I particularly desired not to do so, in order that certain persons may not for this reason take occasion to build up some extravagant philosophic system on what they take to be my principles, and thus cause the blame to be put on me. I refer to those who imagine that in one day they may discover all that another has arrived at in twenty years of work, so soon as he has merely spoken to them two or three words on the subject; while they are really all the more subject to err, and less capable of perceiving the truth as they are the more subtle and lively. For as regards the opinions that are truly mine I do not apologize for them as being new, inasmuch as if we consider the reasons of them well, I assure myself that they will be found to be so simple and so conformable to common sense, as to appear less extraordinary and less paradoxical than any others which may be held on similar subjects. And I do not even boast of being the first discoverer of any of them, but only state that I have adopted them, not because they have been held by others, nor because they have not been so held, but only because Reason has persuaded me of their truth.

Even if artisans are not at once able to carry out the invention[8] explained in the <Dioptrics>, I do not for that reason think that it can be said that it is to be condemned; for, inasmuch as great address and practice is required to make and adjust the mechanism which I have described without omitting any detail, I should not be less astonished at their succeeding at the first effort than I should be supposing some one were in one day to learn to play the guitar with skill, just because a good sheet of musical notation were set up before him. And if I write in French which is the language of my country, rather than in Latin which is that of my teachers, that is {130} because I hope that those who avail themselves only of their natural reason in its purity may be better judges of my opinions than those who believe only in the writings of the ancients; and as to those who unite good sense with study, whom alone I crave for my judges, they will not, I feel sure, be so partial to Latin as to refuse to follow my reasoning because I expound it in a vulgar tongue.

For the rest, I do not desire to speak here more particularly of the progress which I hope in the future to make in the sciences, nor to bind myself as regards the public with any promise which I shall not with certainty be able to fulfill. But I will just say that I have resolved not to employ the time which remains to me in life in any other matter than in endeavoring to acquire some knowledge of nature, which shall be of such a kind that it will enable us to arrive at rules for Medicine more assured than those which have as yet been attained; and my inclination is so strongly opposed to any other kind of pursuit, more especially to those which can only be useful to some by being harmful to others, that if certain circumstances had constrained me to employ them, I do not think that I should have been capable of succeeding. In so saying I make a declaration that I know very well cannot help me to make myself of consideration in the world, but to this end I have no desire to attain; and I shall always hold myself to be more indebted to those by whose favor I may enjoy my leisure without hindrance, than I shall be to any who may offer me the most honorable position in all the world.

Discourse on the Method

Rene Descartes

1637

Introductory Note

The Discourse on the Method and Essays was originally published anonymously in 1637 by Jan Maire of Leiden, in somewhat shabby form. It was Descartes' first published work, the much talked of "World" or "Cosmos" having been suppressed or destroyed on his bearing of the condemnation of Galileo in 1632. In 1636, however, when forty years of age, he felt that it was time to bring his views before the public and publish them abroad. The Elzevirs naturally suggested themselves as the publishers to be selected, especially as they had once before made advances and as the original member of the firm resided in Leiden, where Descartes probably was at the time. They, however, had become less friendly, evidently doubting the success of an anonymous book of the kind, and consequently the author went elsewhere. Descartes endeavored to preserve the anonymity of his work with scrupulous care, and was annoyed by his zealous but fussy friend Mersenne showing the work to others, and announcing the author's name, with the ostensible object of obtaining from the King of France permission for its publication. In the end he found himself compelled to avow his authorship.

The book was written in French "the language of my country," as Descartes says, "in the hope that those who avail themselves of their natural reason alone, may be better judges of my opinions than those who give heed only to the writings of the ancients." Four hundred copies were given him for distribution to his friends and this was probably all the remuneration that he expected; none other seems in any case to have come to him.

The Latin version is the work of Etienne de Courcelles, a Protestant minister at Amsterdam, and was published in 1644 by Louis Elzevir at the same time as the "Principles." The Essays (the Dioptric, the Meteors and the Geometry) which are termed "Essays on this Method" have not been translated here.

Elizabeth. S. Haldane, 1911

Discourse on the Method
Of Rightly Conducting the Reason
And Seeking for Truth in the Sciences.

If this Discourse appears too long to be read all at once, it may be separated into six portions. And in the first these will be found various considerations respecting the sciences; in the second, the principal rules regarding the method which the author has sought out; while in the third are some of the rules of morality which he has derived from this Method. In the fourth are the reasons by which he proves the existence of God and of the human soul, which farm the foundation of his Metaphysic. In the fifth, the order of the questions regarding physics which he has investigated, and particularly the explanation of the movement of the heart, and of some other difficulties which pertain to medicine, as also the deference between the soul of man and that of the brutes. And in the last part the questions raised relate to those matters which the author believes to be requisite in order to advance further in the investigation of nature, in addition to the reasons that caused him to write.

Part I

Good sense is of all things in the world the most equally distributed, for everybody thinks himself so abundantly provided with it, that even those most difficult to please in all other matters do not commonly desire more of it than they already possess. It is unlikely that this is an error on their part; it seems rather to be evidence in support of the view that the power of forming a good judgment and of distinguishing the true from the false, which is properly speaking what is called Good sense or Reason, is by nature equal in all men. Hence too it will show that the diversity of our opinions does not proceed from some men being more rational than others, but solely from the fact that our thoughts pass through {82}diverse channels and the same objects are not considered by an. For to be possessed of good mental powers is not sufficient; the principal matter is to apply them well. The greatest minds are capable of the greatest vices as well as of the greatest virtues, and those who proceed very slowly may, provided they always follow the straight road, really advance much faster than those who, though they run, forsake it.

For myself I have never ventured to presume that my mind was in any way more perfect than that of the ordinary man; I have even longed to possess thought as quick, or an imagination as accurate and distinct, or a memory as comprehensive or ready, as some others. And besides these I do not know any other qualities that make for the perfection of the human mind. For as to reason or sense, inasmuch as it is the only thing that constitutes us men and distinguishes us from the brutes, I would fain believe that it is to be found complete in each individual, and in this I follow the common opinion of the philosophers, who say that the question of more or less occurs only in the sphere of the *accidents* and does not affect the *forms* or natures of the *individuals* in the same *species*.

But I shall not hesitate to say that I have had great good fortune from my youth up, in lighting upon and pursuing certain paths which have conducted me to considerations and maxims from

which I have formed a Method, by whose assistance it appears to me I have the means of gradually increasing my knowledge and of little by little raising it to the highest possible point which the mediocrity of my talents and the brief duration of my life call permit me to reach. For I have already reaped from it fruits of such a nature that, even though I always try in the judgments I make on myself to lean to the side of self-depreciation rather than to that of arrogance, and though, looking with the eye of a philosopher on the diverse actions and enterprises of all mankind, I find scarcely any which do not seem to me vain and useless, I do not cease to receive extreme satisfaction in the progress which I seem to have already made in the search after truth, and to form such hopes for the future as to venture to believe that, if amongst the occupations of men, simply as men, there is some one in particular that is excellent and important, that is the one which I have selected.

It must always be recollected, however, that possibly I deceive myself, and that what I take to be gold and diamonds is perhaps no {83} more than copper and glass. I know how subject we are to delusion in whatever touches ourselves, and also how much the judgments of our friends ought to be suspected when they are in our favor. But in this Discourse I shall be very happy to show the paths I have followed, and to set forth my life as in a picture, so that everyone may judge of it for himself; and thus in learning from the common talk what are the opinions which are held of it, a new means of obtaining self-instruction will be reached, which I shall add to those which I have been in the habit of using.

Thus my design is not here to teach the Method which everyone should follow in order to promote the good conduct of his Reason, but only to show in what manner I have endeavored to conduct my own. Those who set about giving precepts must esteem themselves more skillful than those to whom they advance them, and if they fall short in the smallest matter they must of course take the blame for it. But regarding this Treatise simply as a history, or, if you prefer it, a fable in which, amongst certain things which may be imitated, there are possibly others also which it would not be right to follow, I hope that it will be of use to some without being hurtful to any, and that all will thank me for my frankness.

I have been nourished on letters since my childhood, and since I was given to believe that by their means a clear and certain knowledge could be obtained of all that is useful in life, I had an extreme desire to acquire instruction. But so soon as I had achieved the entire course of study at the close of which one is usually received into the ranks of the learned, I entirely changed my opinion. For I found myself embarrassed with so many doubts and errors that it seemed to me that the effort to instruct myself had no effect other than the increasing discovery of my own ignorance. And yet I was studying at one of the most celebrated Schools in Europe, where I thought that there must be men of learning if they were to be found anywhere in the world. I learned there all that others learned; and not being satisfied with the sciences that we were taught, I even read through all the books which fell into my hands, treating of what is considered most curious and rare. Along with this I knew the judgments that others had formed of me, and I did not feel that I was esteemed inferior to my fellow-students, although there were amongst them some destined to fill the places of our masters. And finally our century seemed to me as flourishing, and as fertile in great minds, as any which had preceded. And this made me take the liberty of judging all {84} others by myself and of coming to the conclusion that there was no learning in the world such as I was formerly led to believe it to be.

I did not omit, however, always to hold in esteem those exercises which are the occupation of the Schools. I knew that the Languages which one learns there are essential for the understanding of

all ancient literature; that fables with their charm stimulate the mind and histories of memorable deeds exalt it; and that, when read with discretion, these books assist in forming a sound judgment. I was aware that the reading of all good books is indeed like a conversation with the noblest men of past centuries who were the authors of them, nay a carefully studied conversation, in which they reveal to us none but the best of their thoughts. I deemed Eloquence to have a power and beauty beyond compare; that Poesy has most ravishing delicacy and sweetness; that in Mathematics there are the subtlest discoveries and inventions which may accomplish much, both in satisfying the curious, and in furthering all the arts, and in diminishing man's labor; that those writings that deal with Morals contain much that is instructive, and many exhortations to virtue which are most useful; that Theology points out the way to Heaven; that Philosophy teaches us to speak with an appearance of truth on all things, and causes us to be admired by the less learned; that Jurisprudence, Medicine and all other sciences bring honor and riches to those who cultivate them; and finally that it is good to have examined all things, even those most full of superstition and falsehood, in order that we may know their just value, and avoid being deceived by them.

But I considered that I had already given sufficient time to languages and likewise even to the reading of the literature of the ancients, both their histories and their fables. For to converse with those of other centuries is almost the same thing as to travel. It is good to know something of the customs of different peoples in order to judge more sanely of our own, and not to think that everything of a fashion not ours is absurd and contrary to reason, as do those who have seen nothing. But when one employs too much time in traveling, one becomes a stranger in one's own country, and when one is too curious about things which were practiced in past centuries, one is usually very ignorant about those which are practiced in our own time. Besides, fables make one imagine many events possible which in reality are not so, and even the most accurate of histories, if they do not exactly misrepresent {85} or exaggerate the value of things in order to render them more worthy of being read, at least omit in them all the circumstances which are basest and least notable; and from this fact it follows that what is retained is not portrayed as it really is, and that those who regulate their conduct by examples which they derive from such a source, are liable to fall into the extravagances of the knights-errant of Romance, and form projects beyond their power of performance.

I esteemed Eloquence most highly and I was enamored of Poesy, but I thought that both were gifts of the mind rather than fruits of study. Those who have the strongest power of reasoning, and who most skillfully arrange their thoughts in order to render them clear and intelligible, have the best power of persuasion even if they can bat speak the language of Lower Brittany and have never learned Rhetoric. And those who have the most delightful original ideas and who know how to express them with the maximum of style and suavity, would not fail to be the beat poets even if the art of Poetry were unknown to them.

Most of all was I delighted with Mathematics because of the certainty of its demonstrations and the evidence of its reasoning; but I did not yet understand its true use, and, believing that it was of service only in the mechanical arts, I was astonished that, seeing how firm and solid was its basis, no loftier edifice had been reared thereupon. On the other hand I compared the works of the ancient pagans which deal with Morals to palaces most superb and magnificent, which are yet built on sand and mud alone. They praise the virtues most highly and show them to be more worthy of being prized than anything else in the world, but they do not sufficiently teach us to become acquainted with them, and often that which is called by a fine name is nothing but insensibility, or pride, or despair, or parricide.

I honored our Theology and aspired as much as anyone to reach to heaven, but having learned to regard it as a most highly assured fact that the road is not less open to the most ignorant than to the most learned, and that the revealed truths which conduct thither are quite above our intelligence, I should not have dared to submit them to the feebleness of my reasonings; and I thought that, in order to undertake to examine them and succeed in so doing, it was necessary to have some extraordinary assistance from above and to be more than a mere man.

I shall not say anything about Philosophy, but that seeing that {86} it has been cultivated for many centuries by the best minds that have ever lived, and that nevertheless no single thing is to be found in it which is not subject of dispute, and in consequence which is not dubious, I had not enough presumption to hope to fare better there than other men had done. And also, considering how many conflicting opinions there may be regarding the self-same matter, all supported by learned people, while there can never be more than one which is true, I esteemed as well-nigh false all that only went as far as being probable.

Then as to the other sciences, inasmuch as they derive their principles from Philosophy, I judged that one could have built nothing solid on foundations so far from firm. And neither the honor nor the promised gain was sufficient to persuade me to cultivate them, for, thanks be to God, I did not find myself in a condition which obliged me to make a merchandise of science for the improvement of my fortune; and, although I did not pretend to scorn all glory like the Cynics, I yet had very small esteem for what I could not hope to acquire, excepting through fictitious titles. And, finally, as to false doctrines, I thought that I already knew well enough what they were worth to be subject to deception neither by the promises of an alchemist, the predictions of an astrologer, the impostures of a magician, the artifices or the empty boastings of any of those who make a profession of knowing that of which they are ignorant.

This is why, as soon as age permitted me to emerge from the control of my tutors, I entirely quitted the study of letters. And resolving to seek no other science than that which could be found in myself, or at least in the great book of the world, I employed the rest of my youth in travel, in seeing courts and armies, in intercourse with men of diverse temperaments and conditions, in collecting varied experiences, in proving myself in the various predicaments in which I was placed by fortune, and under all circumstances bringing my mind to bear on the things which came before it, so that I might derive some profit from my experience. For it seemed to me that I might meet with much more truth in the reasonings that each man makes on the matters that specially concern him, and the issue of which would very soon punish him if he made a wrong judgment, than in the case of those made by a man of letters in his study touching speculations which lead to no result, and which bring about no other consequences to himself excepting that he will be all the more vain the more they are removed from common sense, {87} since in this case it Proves him to have employed so much the more ingenuity and skill in trying to make them seem probable. And I always had an excessive desire to learn to distinguish the true from the false, in order to see clearly in my actions and to walk with confidence in this life.

It is true that while I only considered the manners of other men I found in them nothing to give me settled convictions; and I remarked in them almost as much diversity as I had formerly seen in the opinions of philosophers. So much was this the case that the greatest profit which I derived from their study was that, in seeing many things which, although they seem to us very extravagant and ridiculous, were yet commonly received and approved by other great nations, I learned to believe nothing too certainly of which I had only been convinced by example and custom. Thus little by

little I was delivered from many errors which might have obscured our natural vision and rendered us less capable of listening to Reason. But after I had employed several years in thus studying the book of the world and trying to acquire some experience, I one day formed the resolution of also making myself an object of study and of employing all the strength of my mind in choosing the road I should follow. This succeeded much better, it appeared to me, than if I had never departed either from my country or my books.

Part II

I was then in Germany, to which country I had been attracted by the wars which are not yet at an end. And as I was returning from the coronation of the Emperor to join the army, the setting in of winter detained me in a quarter where, since I found no society to divert me, while fortunately I had also no cares or passions to trouble me, I remained the whole day shut up alone in a stove-heated room, where I had complete leisure to occupy myself with my own thoughts. One of the first of the considerations that occurred to me was that there is very often less perfection in works composed of several portions, and carried out by the hands of various masters, than in those on which one individual alone has worked. Thus we see that buildings planned and carried out by one architect alone are usually more beautiful and better proportioned than those which many have tried to put in order and improve, making use of old walls which were built with other ends in view. In the game way also, those ancient cities which, originally mere villages, have become in the process of time great towns, are usually {88} badly constructed in comparison with those which are regularly laid out on a plain by a surveyor who is free to follow his own ideas. Even though, considering their buildings each one apart, there is often as much or more display of skill in the one case than in the other, the former have large buildings and small buildings indiscriminately placed together, thus rendering the streets crooked and irregular, so that it might be said that it was chance rather than the will of men guided by reason that led to such an arrangement. And if we consider that this happens despite the fact that from all time there have been certain officials who have had the special duty of looking after the buildings of private individuals in order that they may be public ornaments, we shall understand how difficult it is to bring about much that is satisfactory in operating only upon the works of others. Thus I imagined that those people who were once half-ravage, and who have become civilized only by slow degrees, merely forming their laws as the disagreeable necessities of their crimes and quarrels constrained them, could not succeed in establishing so good a system of government as those who, from the time they first came together as communities, carried into effect the constitution laid down by some prudent legislator. Thus it is quite certain that the constitution of the true Religion whose ordinances are of God alone is incomparably better regulated than any other. And, to come down to human affairs, I believe that if Sparta was very flourishing in former times, this was not because of the excellence of each and every one of its laws, seeing that many were very strange and even contrary to good morals, but because, being drawn up by one individual, they all tended towards the same end. And similarly I thought that the sciences found in books-in those at least whose reasonings are only probable and which have no demonstrations, composed as they are of the gradually accumulated opinions of many different individuals-do not approach so near to the truth as the simple reasoning which a man of common sense can quite naturally carry out respecting the things which come immediately before him. Again I thought that since we have all been children before being men, and since it has for long fallen to us to be governed by our appetites and by our teachers (who often

enough contradicted one another, and none of whom perhaps counseled us always for the best), it is almost impossible that our judgments should be so excellent or solid as they should have been had we had complete use of our reason since our birth, and had we been guided by its means alone. {89}

It is true that we do not find that all the houses in a town are razed to the ground for the sole reason that the town is to be rebuilt in another fashion, with streets made more beautiful; but at the same time we see that many people cause their own houses to be knocked down in order to rebuild them, and that sometimes they are forced so to do where there is danger of the houses falling of themselves, and when the foundations are not secure. From such examples I argued to myself that there was no plausibility in the claim of any private individual to reform a state by altering everything, and by overturning it throughout, in order to set it right again. Nor is it likewise probable that the whole body of the Sciences, or the order of teaching established by the Schools, should be reformed. But as regards all the opinions which up to this time I had embraced, I thought I could not do better than endeavor once for all to sweep them completely away, so that they might later on be replaced, either by others which were better, or by the same, when I had made them conform to the uniformity of a rational scheme. And I firmly believed that by this means I should succeed in directing my life much better than if I had only built on old foundations, and relied on principles of which I allowed myself to be in youth persuaded without having inquired into their truth. For although in so doing I recognized various difficulties, these were at the same time not insurmountable, nor comparable to those which are found in reformation of the most insignificant kind in matters which concern the public. In the case of great bodies it is too difficult a task to raise them again when they are once thrown down, or even to keep them in their places when once thoroughly shaken; and their fall cannot be otherwise than very violent. Then as to any imperfections that they may possess (and the very diversity that is found between them is sufficient to tell us that these in many cases exist) custom has doubtless greatly mitigated them, while it has also helped us to avoid, or insensibly corrected a number against which mere foresight would have found it difficult to guard. And finally the imperfections are almost always more supportable than would be the process of removing them, just as the great roads which wind about amongst the mountains become, because of being frequented, little by little so well-beaten and easy that it is much better to follow them than to try to go more directly by climbing over rocks and descending to the foot of precipices.

This is the reason why I cannot in any way approve of those turbulent and unrestful spirits who, being called neither by birth {90} nor fortune to the management of public affairs, never fail to have always iii their minds some new reforms. And if I thought that in this treatise there was contained the smallest justification for this folly, I should be very sorry to allow it to be published. My design has never extended beyond trying to reform my own opinion and to build on a foundation which is entirely my own. If my work has given me a certain satisfaction, so that I here present to you a draft of it, I do not so do because I wish to advise anybody to imitate it. Those to whom God has been most beneficent in the bestowal of His graces will perhaps form designs which are more elevated; but I fear much that this particular one will seem too venturesome for many. The simple resolve to strip oneself of all opinions and beliefs formerly received is not to be regarded as an example that each man should follow, and the world may be said to be mainly composed of two classes of minds neither of which could prudently adopt it. There are those who, believing themselves to be cleverer than they are, cannot restrain themselves from being precipitate in judgment and have not sufficient patience to arrange their thoughts in proper order;

hence, once a man of this description had taken the liberty of doubting the principles he formerly accepted, and had deviated from the beaten track, he would never be able to maintain the path which must be followed to reach the appointed end more quickly, and he would hence remain wandering astray all through his life. Secondly, there are those who having reason or modesty enough to judge that they are less capable of distinguishing truth from falsehood than some others from whom instruction might be obtained, are right in contenting themselves with following the opinions of these others rather than in searching better ones for themselves.

For myself I should doubtless have been of these last if I had never had more than a single master, or had I never known the diversities which have from all time existed between the opinions of men of the greatest learning. But I had been taught, even in my College days, that there is nothing imaginable so strange or so little credible that it has not been maintained by one philosopher or other, and I further recognized in the course of my travels that all those whose sentiments are very contrary to ours are yet not necessarily barbarians or savages, but may be possessed of reason in as great or even a greater degree than ourselves. I also considered how very different the self-same man, identical in mind and spirit, may become, according as he is brought up from childhood amongst the French or Germans, or has passed his whole life amongst Chinese or {91} cannibals. I likewise noticed how even in the fashions of one's clothing the same thing that pleased us ten years ago, and which will perhaps please us once again before ten years are passed, seems at the present time extravagant and ridiculous. I thus concluded that it is much more custom and example that persuade us than any certain knowledge, and yet in spite of this the voice of the majority does not afford a proof of any value in truths a little difficult to discover, because such truths are much more likely to have been discovered by one man than by a nation. I could not, however, put my finger on a single person whose opinions seemed preferable to those of others, and I found that I was, so to speak, constrained myself to undertake the direction of my procedure.

But like one who walks alone and in the twilight I resolved to go so slowly, and to use so much circumspection in all things, that if my advance was but very small, at least I guarded myself well from falling. I did not wish to set about the final rejection of any single opinion which might formerly have crept into my beliefs without having been introduced there by means of Reason, until I had first of all employed sufficient time in planning out the task which I had undertaken, and in seeking the true Method of arriving at a knowledge of all the things of which my mind was capable.

Among the different branches of Philosophy, I had in my younger days to a certain extent studied Logic; and in those of Mathematics, Geometrical Analysis and Algebra-three arts or sciences which seemed as though they ought to contribute something to the design I had in view. But in examining them I observed in respect to Logic that the syllogisms and the greater part of the other teaching served better in explaining to others those things that one knows (or like the art of Lully, in enabling one to speak without judgment of those things of which one is ignorant) than in learning what is new. And although in reality Logic contains many precepts which are very true and very good, there are at the same time mingled with them so many others which are hurtful or superfluous, that it is almost as difficult to separate the two as to draw a Diana or a Minerva out of a block of marble which is not yet roughly hewn. And as to the Analysis of the ancients and the Algebra of the moderns, besides the fact that they embrace only matters the most abstract, such as appear to have no actual use, the former is always so restricted to the consideration of symbols that it cannot exercise the Understanding without greatly fatiguing the imagination; and in the latter one is so subjected to certain rules and formulas that {92} the result is the construction of an art

which is confused and obscure, and which embarrasses the mind, instead of a science which contributes to its cultivation. This made me feel that some other Method must be found, which, comprising the advantages of the three, is yet exempt from their faults. And as a multiplicity of laws often furnishes excuses for evil-doing, and as a State is hence much better ruled when, having but very few laws, these are most strictly observed; so, instead of the great number of precepts of which Logic is composed, I believed that I should find the four which I shall state quite sufficient, provided that I adhered to a firm and constant resolve never on any single occasion to fail in their observance.

The first of these was to accept nothing as true which I did not clearly recognize to be so: that is to say, carefully to avoid precipitation and prejudice in judgments, and to accept in them nothing more than what was presented to my mind so clearly and distinctly that I could have no occasion to doubt it.

The second was to divide up each of the difficulties which I examined into as many parts as possible, and as seemed requisite in order that it might be resolved in the best manner possible.

The third was to carry on my reflections in due order, commencing with objects that were the most simple and easy to understand, in order to rise little by little, or by degrees, to knowledge of the most complex, assuming an order, even if a fictitious one, among those which do not follow a natural sequence relatively to one another.

The last was in all cases to make enumerations so complete and reviews so general that I should be certain of having omitted nothing.

Those long chains of reasoning, simple and easy as they are, of which geometricians make use in order to arrive at the most difficult demonstrations, had caused me to imagine that all those things which fall under the cognizance of man might very likely be mutually related in the same fashion; and that, provided only that we abstain from receiving anything a8 true which is not so, and always retain the order which is necessary in order to deduce the one conclusion from the other, there can be nothing so remote that we cannot reach to it, nor so recondite that we cannot discover it. And I had not much trouble in discovering which objects it was necessary to begin with, for I already knew that it was with the most simple and those most easy to apprehend. Considering also that, of all those who have hitherto sought for the truth in the {93} Sciences, it has been the mathematicians alone who have been able to succeed in making any demonstrations, that is to say producing reasons which are evident and certain, I did not doubt that it had been by means of a similar kind that they carried on their investigations. I did not at the same time hope for any practical result in so doing, except that my mind would become accustomed to the nourishment of truth and would not content itself with false reasoning. But for all that I had no intention of trying to master all those particular sciences that receive in common the name of Mathematics; but observing that, although their objects are different, they do not fail to agree in this, that they take nothing under consideration but the various relationships or proportions which are present in these objects, I thought that it would be better if I only examined these proportions in their general aspect, and without viewing them otherwise than in the objects which would serve most to facilitate a knowledge of them. Not that I should in any way restrict them to these objects, for I might later on all the more easily apply them to all other objects to which they were applicable. Then, having carefully noted that in order to comprehend the proportions I should sometimes require to consider each one in particular, and sometimes merely keep them in mind, or take them in groups, I thought that, in order the better to consider them in detail, I should picture them in the form of

lines, because I could find no method more simple nor more capable of being distinctly represented to my imagination and senses. I considered, however, that in order to keep them in my memory or to embrace several at once, it would be essential that I should explain them by means of certain formulas, the shorter the better. And for this purpose it was requisite that I should borrow all that is best in Geometrical Analysis and Algebra, and correct the errors of the one by the other.

As a matter of fact, I can venture to say that the exact observation of the few precepts which I had chosen gave me so much facility in sifting out all the questions embraced in these two sciences, that in the two or three months which I employed in examining them -- commencing with the most simple and general, and making each truth that I discovered a rule for helping me to find others -- not only did I arrive at the solution of many questions which I had hitherto regarded as most difficult, but, towards the end, it seemed to me that I was able to determine in the case of those of which I was still ignorant, by what means, and in how far, it was possible to {94} solve them. In this I might perhaps appear to you to be very vain if you did not remember that having but one truth to discover in respect to each matter, whoever succeeds in finding it knows in its regard as much as can be known. It is the same as with a child, for instance, who has been instructed in Arithmetic and has made an addition according to the rule prescribed; he may be sure of having found as regards the sum of figures given to him all that the human mind can know. For, in conclusion, the Method which teaches us to follow the true order and enumerate exactly every term in the matter under investigation contains everything which gives certainty to the rules of Arithmetic.

But what pleased me most in this Method was that I was certain by its means of exercising my reason in all things, if not perfectly, at least as well as was in my power. And besides this, I felt in making use of it that my mind gradually accustomed itself to conceive of its objects more accurately and distinctly; and not having restricted this Method to any particular matter, I promised myself to apply it as usefully to the difficulties of other sciences as I had done to those of Algebra. Not that on this account I dared undertake to examine just at once all those that might present themselves; for that would itself have been contrary to the order which the Method prescribes. But having noticed that the knowledge of these difficulties must be dependent on principles derived from Philosophy in which I yet found nothing to be certain, I thought that it was requisite above all to try to establish certainty in it. I considered also that since this endeavor is the most important in all the world, and that in which precipitation and prejudice were most to be feared, I should not try to grapple with it till I had attained to a much riper age than that of three and twenty, which was the age I had reached. I thought, too, that I should first of all employ much time in preparing myself for the work by eradicating from my mind all the wrong opinions which I had up to this time accepted, and accumulating a variety of experiences fitted later on to afford matter for my reasonings, and by ever exercising myself in the Method which I had prescribed, in order more and more to fortify myself in the power of using it. {95}

Part III

And finally, as it is not sufficient, before commencing to rebuild the house which we inhabit, to pull it down and provide materials and an architect (or to act in this capacity ourselves, and make a careful drawing of its design), unless we have also provided ourselves with some other house where we can be comfortably lodged during the time of rebuilding, so in order that I should not remain irresolute in my actions while reason obliged me to be so in my judgments, and that I might not

omit to carry on my life as happily as I could, I formed for myself a code of morals for the time being which did not consist of more than three or four maxims, which maxims I should like to enumerate to you.

The first was to obey the laws and customs of my country, adhering constantly to the religion in which by God's grace I had been instructed since my childhood, and in all other things directing my conduct by opinions the most moderate in nature, and the farthest removed from excess in all those which are commonly received and acted on by the most judicious of those with whom I might come in contact. For since I began to count my own opinions as naught, because I desired to place all under examination, I was convinced that I could not do better than follow those held by people on whose judgment reliance could be placed. And although such persons may possibly exist amongst the Persians and Chinese as well as amongst ourselves, it seemed to me that it was most expedient to bring my conduct into harmony with the ideas of those with whom I should have to live; and that, in order to ascertain that these were their real opinions, I should observe what they did rather than what they said, not only because in the corrupt state of our manners there are few people who desire to say all that they believe, but also because many are themselves ignorant of their beliefs. For since the act of thought by which we believe a thing is different from that by which we know that we believe it, the one often exists without the other. And amongst many opinions all equally received, I chose only the most moderate, both because these are always most suited for putting into practice, and probably the best (for all excess has a tendency to be bad), and also because I should have in a less degree turned aside from the right path, supposing that I was wrong, than if, having chosen an extreme course, I found that I had chosen amiss. I also made a point of counting as excess all the engagements by means of which we limit {96} in some degree our liberty. Not that I hold in low esteem those laws which, in order to remedy the inconstancy of feeble souls, permit, when we have a good object in our view, that certain vows be taken, or contracts made, which oblige us to carry out that object. This sanction is even given for security in commerce where designs are wholly indifferent. But because I saw nothing in all the world remaining constant, and because for my own part I promised myself gradually to get my judgments to grow better and never to grow worse, I should have thought that I had committed a serious sin against commonsense if, because I approved of something at one time, I was obliged to regard it similarly at a later time, after it had possibly ceased to meet my approval, or after I had ceased to regard it in a favorable light.

My second maxim was that of being as firm and resolute in my actions as I could be, and not to follow less faithfully opinions the most dubious, when my mind was once made up regarding them, than if these had been beyond doubt. In this I should be following the example of travelers, who, finding themselves lost in a forest, know that they ought not to wander first to one side and then to the other, nor, still less, to stop in one place, but understand that they should continue to walk as straight as they can in one direction, not diverging for any slight reason, even though it was possibly chance alone that first determined them in their choice. By this means if they do not go exactly where they wish, they will at least arrive somewhere at the end, where probably they will be better off than in the middle of a forest. And thus since often enough in the actions of life no delay is permissible, it is very certain that, when it is beyond our power to discern the opinions which carry most truth, we should follow the most probable; and even although we notice no greater probability in the one opinion than in the other, we at least should make up our minds to follow a particular one and afterwards consider it as no longer doubtful in its relationship to practice, but as very true and very certain, inasmuch as the reason,which caused us to determine

upon it is known to be so. And henceforward this principle was sufficient to deliver me from all the penitence and remorse which usually affect the mind and agitate the conscience of those weak and vacillating creatures who allow themselves to keep changing their procedure, and practice as good, things which they afterwards judge to be evil.

My third maxim was to try always to conquer myself rather than fortune, and to alter my desires rather than change the order {97} of the world, and generally to accustom myself to believe that there is nothing entirely within our power but our own thoughts: so that after we have done our best in regard to the things that are without us, our ill-success cannot possibly be failure on our part.[2] And this alone seemed to me sufficient to prevent my desiring anything in the future beyond what I could actually obtain, hence rendering me content; for since our will does not naturally induce us to desire anything but what our understanding represents to it as in some way possible of attainment, it is certain that if we consider all good things which are outside of us as equally outside of our power, we should not have more regret in resigning those goods which appear to pertain to our birth, when we are deprived of them for no fault of our own, than we have in not possessing the kingdoms of China or Mexico. In the same way, making what is called a virtue out of a necessity, we should no more desire to be well if ill, or free, if in prison, than we now do to have our bodies formed of a substance as little corruptible as diamonds, or to have Wings to fly with like birds. I allow, however, that to accustom oneself to regard all things from this point of view requires long exercise and meditation often repeated; and I believe that it is principally in this that is to be found the secret of those philosophers who, in ancient times, were able to free themselves from the empire of fortune, or, despite suffering or poverty, to rival their gods in their happiness. For, ceaselessly occupying themselves in considering the limits which were prescribed to them by nature, they persuaded themselves so completely that nothing was within their own power but their thoughts, that this conviction alone was sufficient to prevent their leaving any longing for other things. And they had so absolute a mastery over their thoughts that they had some reason for esteeming themselves as more rich and more powerful, and more free and more happy than other men, who, however favored by nature or fortune they might be, if devoid of this philosophy, never could arrive a& all at which they aim.

And last of all, to conclude this moral code, I felt it incumbent on me to make a review of the various occupations of men in this life in order to try to choose out the best; and without wishing to say anything of the employment of others I thought that I could I "So that whatever does not eventuate after we have done all in our power that it should happen is to be accounted by us as among the things which evidently cannot be done and which in philosophical phrase are called impossible." Latin Version. {98} not do better than continue in the one in which I found myself engaged, that is to say, in occupying my whole life in cultivating my Reason, and in advancing myself as much as possible in the knowledge of the truth in accordance with the method which I had prescribed myself. I had experienced so much satisfaction since beginning to use this method, that I did not believe that any sweeter or more innocent could in this life be found,-every day discovering by its means some truths which seemed to me sufficiently important, although commonly ignored by other men. The,satisfaction which I had so filled my mind that all else-seemed of no account. And, besides, the three preceding maxims were founded solely on the plan which I had formed of continuing to instruct myself. For since God has given to each of us some light with which to distinguish truth from error, I could not believe that I ought for a single moment to content myself with accepting the opinions held by others unless I had in view the employment of my own judgment in examining them at the proper time; and I could not have held

myself free of scruple in following such opinions, if nevertheless I had not intended to lose no occasion of finding superior opinions, supposing them to exist; and finally, I should not have been able to restrain my desires nor to remain content, if I had not followed a road by which, thinking that I should be certain to be able to acquire all the knowledge of which I was capable, I also thought I should likewise be certain of obtaining all the best things which could ever come within my power. And inasmuch as our will impels us neither to follow after nor to flee from anything, excepting as our understanding represents it as good or evil, it is sufficient to judge wisely in order to act well, and the best judgment brings the best action-that is to say, the acquisition of all the virtues and all the other good things that it is possible to obtain. When one is certain that this point is reached, one cannot fail to be contented.

Having thus assured myself of these maxims, and having set them on one side along with the truths of religion which have always taken the first place in my creed, I judged that as far as the rest of my opinions were concerned, I could safely undertake to rid myself of them. And inasmuch as I hoped to be able to reach my end more successfully in converse with man than in living longer shut up in the warm room where these reflections had come to me, I hardly awaited the end of winter before I once more set myself to travel. And in all the nine following years I did naught but roam {99} hither and thither, trying to be a spectator rather than an actor in all the comedies the world displays. More especially did I reflect in each matter that came before me as to anything which could make it subject to suspicion or doubt, and give occasion for mistake, and I rooted out of my mind all the errors which might have formerly crept in. Not that indeed I imitated the skeptics, who only doubt for the sake of doubting, and pretend to be always uncertain; for, on the contrary, my design was only to provide myself with good ground for assurance, and to reject the quicksand and mud in order to find the rock or clay. In this task it seems to me, I succeeded pretty well, since in trying to discover the error or uncertainty of the propositions which I examined, not by feeble conjectures, but by clear and assured reasonings, I encountered nothing so dubious that I could not draw from it some conclusion that was tolerably secure, if this were no more than the inference that it contained in it nothing that was certain. And just as in pulling down an old house we usually preserve the debris to serve in building up another, so in destroying all those opinions which I considered to be ill-founded, I made various observations and acquired many experiences, which have since been of use to me in establishing those which are more certain. And more than this, I continued to exercise myself in the method which I had laid down for my use; for besides the fact that I was careful as a rule to conduct all my thoughts according to its maxims, I set aside some hours from time to time which I more especially employed in practicing myself in the solution of mathematical problems according to the Method, or in the solution of other problems which though pertaining to other sciences, I was able to make almost similar to those of mathematics, by detaching them from all principles of other sciences which I found to be not sufficiently secure. You will see the result in many examples which are expounded in this volume.[3] And hence, without living to all appearance in any way differently from those who, having no occupation beyond spending their lives in ease and innocence, study to separate pleasure from vice, and who, in order to enjoy their leisure without weariness, make use of all distractions that are innocent and good, I did not cease to prosecute my design, and to profit perhaps even more in my study of truth than if I had done nothing but read books or associate with literary people. {100}

These nine years thus passed away before I had taken any definite part in regard to the difficulties as to which the learned are in the habit of disputing, or had commenced to seek the foundation of any philosophy more certain than the vulgar. And the example of many excellent men who had

tried to do the same before me, but, as it appears to me, without success, made me imagine it to be so hard that possibly I should not have dared to undertake the task, had I not discovered that someone had spread abroad the report that I had already reached its conclusion. I cannot tell on what they based this opinion; if my conversation has contributed anything to it, this must have arisen from my confessing my ignorance more ingenuously than those who have studied a little usually do. And perhaps it was also due to my having shown forth my reasons for doubting many things which were held by others to be certain, rather than from having boasted of any special philosophic system. But being at heart honest enough not to desire to be esteemed as different from what I am, I thought that I must try by every means in my power to render myself worthy of the reputation which I had gained. And it is just eight years ago that this desire made me resolve to remove myself from all places where any acquaintances were possible, and to retire to a country such as this,[4] where the long-continued war has caused such order to be established that the armies which are maintained seem only to be of use in allowing the inhabitants to enjoy the fruits of peace with so much the more security; and where, in the crowded throng of a great and very active nation, which is more concerned with its own affairs than curious about those of others, without missing ally of the conveniences of the most populous towns, I can live as solitary and retired as in deserts the most remote.

Part IV

I do not know that I ought to tell you of the first meditations there made by me, for they are so metaphysical and so unusual that they may perhaps not be acceptable to everyone. And yet at the same time, in order that one may judge whether the foundations which I have laid are sufficiently secure, I find myself constrained in some measure to refer to them. For a long time I had remarked that it is sometimes requisite in common life to follow opinions which one knows to be most uncertain, exactly as though they were indisputable, as has been said above. But because in this case {101} I wished to give myself entirely to the search after Truth, I thought that it was necessary for me to take an apparently opposite course, and to reject as absolutely false everything as to which I could imagine the least ground of doubt, in order to see if afterwards there remained anything in my belief that was entirely certain. Thus, because our senses sometimes deceive us, I wished to suppose that nothing is just as they cause us to imagine it to be; and because there are men who deceive themselves in their reasoning and fall into paralogisms, even concerning the simplest matters of geometry, and judging that I was as subject to error as was any other, I rejected as false all the reasons formerly accepted by me as demonstrations. And since all the same thoughts and conceptions which we have while awake may also come to us in sleep, without any of them being at that time true, I resolved to assume that everything that ever entered into my mind was no more true than the illusions of my dreams. But immediately afterwards I noticed that whilst I thus wished to think all things false, it was absolutely essential that the "I" who thought this should be somewhat, and remarking that this truth "*I think, therefore I am*" was so certain and so assured that all the most extravagant suppositions brought forward by the skeptics were incapable of shaking it, I came to the conclusion that I could receive it without scruple as the first principle of the Philosophy for which I was seeking.

And then, examining attentively that which I was, I saw that I could conceive that I had no body, and that there was no world nor place where I might be; but yet that I could not for all that

conceive that I was not. On the contrary, I saw from the very fact that I thought of doubting the truth of other things, it very evidently and certainly followed that I was; on the other hand if I had only ceased from thinking, even if all the rest of what I had ever imagined had really existed, I should have no reason for thinking that I had existed. From that I knew that I was a substance the whole essence or nature of which is to think, and that for its existence there is no need of any place, nor does it depend on any material thing; so that this "me," that is to say, the soul by which I am what I am, is entirely distinct from body, and is even more easy to know than is the latter; and even if body were not, the soul would not cease to be what it is.

After this I considered generally what in a proposition is requisite in order to be true and certain; for since I had just discovered one which I knew to be such, I thought that I ought {102} also to know in what this certainty consisted. And having remarked that there was nothing at all in the statement "*I think, therefore I am*" which assures me of having thereby made a true assertion, excepting that I see very clearly that to think it is necessary to be, I came to the conclusion that I might assume, as a general rule, that the things which we conceive very clearly and distinctly are all true-remembering, however, that there is some difficulty in ascertaining which are those that we distinctly conceive.

Following upon this, and reflecting on the fact that I doubted, and that consequently my existence was not quite perfect (for I saw clearly that it was a greater perfection to know than to doubt), I resolved to inquire whence I had learnt to think of anything more perfect than I myself was; and I recognized very clearly that this conception must proceed from some nature which was really more perfect. As to the thoughts which I had of many other things outside of me, like the heavens, the earth, light, heat, and a thousand others, I had not so much difficulty in knowing whence they came, because, remarking nothing in them which seemed to render them superior to me, I could believe that, if they were true, they were dependencies upon my nature, in so far as it possessed some perfection; and if they were not true, that I held them from naught, that is to say, that they were in me because I had something lacking in my nature. But this could not apply to the idea of a Being more perfect than my own, for to hold it from naught would be manifestly impossible; and because it is no less contradictory to say of the more perfect that it is what results from and depends on the less perfect, than to say that there is something which proceeds from nothing, it was equally impossible that I should hold it from myself. In this way it could but follow that it had been placed in me by a Nature which was really more perfect than mine could be, and which even had within itself all the perfections of which I could form any idea -- that is to say, to put it in a word, which was God. To which I added that since I knew some perfections which I did not possess, I was not the only being in existence (I shall here use freely, if you will allow, the terms of the School); but that there was necessarily some other more perfect Being on which I depended, or from which I acquired all that I had. For if I had existed alone and independent of any others, so that I should have had from myself all that perfection of being in which I participated to however small an extent, I should have been able for the same reason to have had all the remainder which {103} I knew that I lacked; and thus I myself should have been infinite, eternal, immutable, omniscient, all-powerful, and, finally, I should have all the perfections which I could discern in God. For, in pursuance of the reasonings which I have just carried on, in order to know the nature of God as far as my nature is capable of knowing it, I had only to consider in reference to all these things of which I found some idea in myself, whether it was a perfection to possess them or not. And I was assured that none of those which indicated some imperfection were in Him, but that all else was present; and I saw that doubt, inconstancy, sadness, and such things, could not be in Him

considering that I myself should have been glad to be without them. In addition to this, I had ideas of many things which are sensible and corporeal, for, although I might suppose that I was dreaming, and that all that I saw or imagined was false, I could not at the same time deny that the ideas were really in my thoughts. But because I had already recognized very clearly in myself that the nature of the intelligence is distinct from that of the body, and observing that all composition gives evidence of dependency, and that dependency is manifestly an imperfection, I came to the conclusion that it could not be a perfection in God to be composed of these two natures, and that consequently He was not so composed. I judged, however, that if there were any bodies in the world, or even any intelligences or other natures which were not wholly perfect, their existence must depend on His power in such a way that they could not subsist without Him for a single moment.

After that I desired to seek for other truths, and having put before myself the object of the geometricians, which I conceived to be a continuous body, or a space indefinitely extended in length, breadth, height or depth, which was divisible into various parts, and which might have various figures and sizes, and might be moved or transposed in all sorts of ways (for all this the geometricians suppose to be in the object of their contemplation), I went through some of their simplest demonstrations, and having noticed that this great certainty which everyone attributes to these demonstrations is founded solely on the fact that they are conceived of with clearness, in accordance with the rule which I have just laid down, I also noticed that there was nothing at all in them to assure me of the existence of their object. For, to take an example, I saw very well that if we suppose a triangle to be given, the three angles must certainly be equal to two right angles; but for all that I saw no {104} reason to be assured that there was any such triangle in existence, while on the contrary, on reverting to the examination of the idea which I had of a Perfect Being, I found that in this case existence was implied in it in the same manner in which the equality of its three angles to two right angles is implied in the idea of a triangle; or in the idea of a sphere, that all the points on its surface are equidistant from its center, or even more evidently still. Consequently it is at least as certain that God, who is a Being, so perfect, is, or exists, as any demonstration of geometry can possibly be.

What causes many, however, to persuade themselves that there is difficulty in knowing this truth, and even in knowing the nature of their soul, is the fact that they never raise their minds above the things of sense, or that they are so accustomed to consider nothing excepting by imagining it, which is a mode of thought specially adapted to material objects, that all that is not capable of being imagined appears to them not to be intelligible at all. This is manifest enough from the fact that even the philosophers in the Schools hold it as a maxim that there is -nothing in the understanding which has not first of all been in the senses, in which there is certainly no doubt that the ideas of God and of the soul have never been. And it seems to me that those who desire to make use of their imagination in order to understand these ideas, act in the same way as if, to hear sounds or smell odors, they should wish to make use of their eyes: excepting that there is indeed this difference, that the sense of sight does not give us less assurance of the truth of its objects, than do those of seeing or of hearing, while neither our imagination nor our senses can ever assure us of anything, if our understanding does not intervene.

If there are finally any persons who are not sufficiently persuaded of the existence of God and of their soul by the reasons which I have brought forward, I wish that they should know that all other things of which they perhaps think themselves more assured (such as possessing a body, and that there are stars and an earth and so on) are less certain. For, although we have a moral assurance of

these things which is such that it seems that it would be extravagant in us to doubt them, at the same time no one, unless he is devoid of reason, can deny, when a metaphysical certainty is in question, that there is sufficient cause for our not having complete assurance, by observing the fact that when asleep we may similarly imagine that we have another body, and that we see other stars and another earth, without there being anything of the kind. {105} For how do we know that the thoughts that come in dreams are more false than those that we have when we are awake, seeing that often enough the former are not less lively and vivid than the latter? And though the wisest minds may study the matter as much as they will, I do not believe that they will be able to give any sufficient reason for removing this doubt, unless they presuppose the existence of God. For to begin with, that which I have just taken as a rule, that is to say, that all the things that we very clearly and very distinctly conceive of are true, is certain only because God is or exists, and that He is a Perfect Being, and that all that is in us issues from Him. From this it follows that our ideas or notions, which to the extent of their being clear or distinct are ideas of real things issuing from God, cannot but to that extent be true. So that though we often enough have ideas which have an element of falsity, this can only be the case in regard to those which have in them somewhat that is confused or obscure, because in so far as they have this character they participate in negation -that is, they exist in us as confused only because we are not quite perfect. And it is evident that there is no less repugnance in the idea that error or imperfection, inasmuch as it is imperfection, proceeds from God, than there is in the idea of truth or perfection proceeding from naught. But if we did not know that all that is in us of reality and truth proceeds from a perfect and infinite Being, however clear and distinct were our ideas, we should not have any reason to assure ourselves that they had the perfection of being true.

But after the knowledge of God and of the soul has thus rendered us certain of this rule, it is very easy to understand that the dreams which we imagine in our sleep should not make us in any way doubt the truth of the thoughts which we have when awake. For even if in sleep we had some very distinct idea such as a geometrician might have who discovered some new demonstration, the fact of being asleep would not militate against its truth. And as to the most ordinary error in our dreams, which consists in their representing to us various objects in the same way as do our external senses, it does not matter that this should give us occasion to suspect the truth of such ideas, because we may be likewise often enough deceived in them without our sleeping at all, just as when those who have the jaundice see everything as yellow, or when stars or other bodies which are very remote appear much smaller than they really are. For, finally, whether we are awake or asleep, we {106} should never allow ourselves to be persuaded excepting by the evidence of our Reason. And it must be remarked that I speak of our Reason and not of our imagination nor of our senses; just as though we see the sun very clearly, we should not for that reason judge that it is of the size of which it appears to be; likewise we could quite well distinctly imagine the head of a lion on the body of a goat, without necessarily concluding that a chimera exists. For Reason does not insist that whatever we see or imagine thus is a truth, but it tells us clearly that all our ideas or notions must have some foundation of truth. For otherwise it could not be possible that God, who is all perfection and truth, should have placed them within us. And because our reasonings are never so evident nor so complete during sleep as during wakefulness, although sometimes our imaginations are then just as lively and acute, or even more so, Reason tells us that since our thoughts cannot possibly be all true, because we are not altogether perfect, that which they have of truth must infallibly be met with in our waking experience rather than in that of our dreams.

Part V

I should be very glad to proceed to show forth the complete chain of truths which I have deduced from these first, but because to do this it would have been necessary now to speak of many matters of dispute among the learned, with whom I have no desire to embroil myself, I think that it will be better to abstain. I shall only state generally what these truths are, so that it may be left to the decision of those best able to judge whether it would be of use for the public to be more particularly informed of them or not. I always remained firm in the resolution which I had made, Dot to assume any other principle than that of which I have just made use, in order to demonstrate the existence of God and of the Soul, and to accept nothing as true which did not appear to be more clear and more certain than the demonstrations of the geometricians had formerly seemed. And nevertheless I venture to say that not only have I found the means of satisfying myself in a short time as to the more important of those difficulties usually dealt with iii philosophy, but I have also observed certain laws which God has so established in Nature, and of which He has imprinted such ideas on our minds, that,, after having reflected sufficiently upon the matter, we cannot doubt their being accurately observed in all that exists or is done in the world. Further, in considering the sequence {107} of these laws, it seems to me that I leave discovered many truth,-, more useful and more important than all that I had formerly learned or even hoped to learn.

But because I tried to explain the most important of these in a Treatise[5] which certain considerations prevented me from publishing, I cannot do better, in making them known, than here summarize briefly what that Treatise contains. I had planned to comprise in it all that I believed myself to know regarding the nature of material objects, before I set myself to write. However, just as the painters who cannot represent equally well on a plain surface all the various sides of a solid body, make selection of one of the most important, which alone is set in the light, while the others are put in shadow and made to appear only as they may be seen in looking at the former, so, fearing that I could not put in my Treatise all that I had in my mind, I undertook only to show very fully my conceptions of light, Later on, when occasion occurred, I resolved to add something about the sun and fixed stars, because light proceeds almost entirely from them; the heavens would be dealt with because they transmit light, the planets, the comets and the earth because they reflect it, and more particularly would all bodies which are on the earth, because they are either colored or transparent, or else luminous; and finally I should deal with man because he is the spectator of all. For the very purpose of putting all these topics somewhat in shadow, and being able to express myself freely about them, without being obliged to adopt or to refute the opinions which are accepted by the learned, I resolved to leave all this world to their disputes, and to speak only of what would happen in a new world if God now created, somewhere in an imaginary space, matter sufficient where-with to form it, and if He agitated in diverse ways, and without any order, the diverse portions of this matter, so that there resulted a chaos as confused as the poets ever feigned, and concluded His work by merely lending His concurrence to Nature in the usual way, leaving her to act in accordance with the laws which He had established. So, to begin with, I described this matter and tried to represent it in such a way, that it seems to me that nothing in the world could be more clear or intelligible, excepting what has just been said of God and the Soul. For I even went so far as expressly to assume that there was in it none of these forms or qualities which are so debated in the Schools, nor anything at all the {108} knowledge of which is not so natural to our minds that none could even pretend to be ignorant of it. Further I pointed

out what are the laws of Nature, and, without resting my reasons on any other principle than the infinite perfections of God, I tried to demonstrate all those of which one could have any doubt, and to show that they are of such a nature that even if God had created other worlds, He could not have created any in which these laws would fail to be. observed. After that, I showed how the greatest part of the matter of which this chaos is constituted, must, in accordance with these laws, dispose and arrange itself in such a fashion as to render it similar to our heavens; and how meantime some of its parts must form an earth, some planets and comets, and some others a sun and fixed stars. And, enlarging on the subject of light, I here explained at length the nature of the light which would be found in the sun and stars, and how from these it crossed in an instant the immense space of the heavens, and how it was reflected from the planets and comets to the earth. To this I also added many things touching the substance, situation, movements, and all the different qualities of these heavens and stars, so that I thought I had said enough to make it clear that there is nothing to be seen in the heavens and stars pertaining to our system which must not, or at least may not, appear exactly the same in those of the system which I described. From this point I came to speak more particularly of the earth, showing how, though I had expressly presupposed that God had not placed any weight in the matter of which it is composed, its parts did not fail all to gravitate exactly to its center; and how, having water and air on its surface, the disposition of the heavens and of the stars, more particularly of the moon, must cause a flux or reflux, which in all its circumstances is similar to that which is observed in our seas, and besides that, a certain current both of water and air from east to west, such as may also be observed in the tropics. I also showed how the mountains, seas, fountains and rivers, could naturally be formed in it, how the metals came to be in the mines and the plants to grow in the fields; and generally how all bodies, called mixed or composite, might arise. And because I knew nothing but fire which could produce light, excepting the stars, I studied amongst other things to make very clear all that pertains to its nature, how it is formed, how nourished, how there is sometimes only heat without light, and sometimes light without heat; I showed, too, how different colors might by it be induced upon different bodies and qualities of diverse kinds, how {109} some of these were liquefied and others solidified, bow nearly all can be consumed or converted into ashes and smoke by its means, and finally how of these ashes, by the intensity of its action alone, it forms glass. Since this transformation of ashes into glass seemed to me as wonderful as any other process in nature, I took particular pleasure in describing it.

I did not at the same time wish to infer from all these facts that this world has been created in the manner which I described; for it is much more probable that at the beginning God made it such as it was to be. But it is certain, and it is an opinion commonly received by the theologians, that the action by which He now preserves it is just the same as that by which He at first created it. In this way, although He had not, to begin with, given this world any other form than that of chaos, provided that the laws of nature had once been established and that He had lent His aid in order that its action should be according to its wont, we may well believe, without doing outrage to the miracle of creation, that by this means alone all things which are purely material might in course of time have become such as we observe them to be at present; and their nature is much easier to understand when we see them coming to pass little by little in this manner, than were we to consider them as all complete to begin with.

From a description of inanimate bodies and plants I passed on to that of animals, and particularly to that of men. But since I had not yet sufficient knowledge to speak of them in the same style as of the rest, that is to say, demonstrating the effects from the causes, and showing from what

beginnings and in what fashion Nature must produce them, I contented myself with supposing that God formed the body of man altogether like one of ours, in the outward figure of its members as well as in the interior conformation of its organs, without making use of any matter other than that which I had described, and without at the first placing in it a rational soul, or any other thing which might serve as a vegetative or as a sensitive soul; excepting that He kindled in the heart one of these fires without light, which I have already described, and which I did not conceive of as in any way different from that which makes the hay heat when shut up before it is dry, and which makes new wine grow frothy when it is left to ferment over the fruit. For, examining the functions which might in accordance with this supposition exist in this body, I found precisely all those which might exist in us without our having the power of thought, and consequently {110} without our soul-that is to say, this part of us, distinct from the body, of which it has just been said that its nature is to think-contributing to it, functions which are identically the same as those in which animals lacking reason may be said to resemble us. For all that, I could not find in these functions any which, being dependent on thought, pertain to us alone, inasmuch as we are men; while I found all of them afterwards, when I assumed that God had created a rational soul and that He had united it to this body in a particular manner which I described.

But in order to show how I there treated of this matter, I wish here to set forth the explanation of the movement of heart and arteries which, being the first and most general movement that is observed in animals, will give us the means of easily judging as to what we ought to think about all the rest. And so that there may be less difficulty in understanding what I shall say on this matter, I should like that those not versed in anatomy should take the trouble, before reading this, of having out up before their eyes the heart of some large animal which has lungs (for it is in all respects sufficiently similar to the heart of a man), and cause that there be demonstrated to them the two chambers or cavities which are within it. There is first of all that which is on the right side, with which two very large tubes or channels correspond, viz. the *vena cava*, which is the principal receptacle of the blood, and so to speak the trunk of a tree of which all the other veins of the body are the branches; and there is the arterial vein which has been badly named because it is nothing but an artery which, taking its origin from the heart, divides, after having issued from it, into many branches which proceed to disperse themselves all through the lungs. Then there is secondly the cavity on the left side with which there again correspond two tubes which are as large or larger than the preceding, viz. the venous artery, which has also been badly named, because it is nothing but a vein which comes from the lungs, where it is divided into many branches, interlaced with those of the arterial vein, and with those of the tube which is called the windpipe, through which enters the air which we breathe; and the great artery which, issuing from the heart, sends its branches throughout the body. I should also wish that the eleven little membranes, which, like so many doors, open and shut the four entrances which are in these two cavities, should be carefully shown. There are of these three at the entrance of the *vena cava*, where they are so arranged that they can in nowise prevent the blood which it contains {111} from flowing into the right cavity of the heart and yet exactly prevent its issuing out; there are three at the entrance to the arterial vein, which, being arranged quite the other way, easily allow the blood which is in this cavity to pass into the lungs, but not that which is already in the lungs to return to this cavity. There are also two others at the entrance of the venous artery, which allow the blood in the lungs to flow towards the left cavity of the heart, but do not permit its return; and three at the entrance of the great artery, which allow the blood to flow from the heart, but prevent its return. There is then no cause to seek for any other reason for the number of these membranes, except that the opening of the venous

artery being oval, because of the situation where it is met with, may be conveniently closed with two membranes, while the others, being round, can be better closed with three. Further, I should have my readers consider that the grand artery and the arterial vein are much harder and firmer than are the venous artery and the *vena cava*; and that these two last expand before entering the heart, and there form so to speak two pockets called the auricles of the heart, which are composed of a tissue similar to its own; and also that there is always more heat in the heart than in any other part of the body; and finally that this heat is capable of causing any drop of blood that enters into its cavities promptly to expand and dilate, as liquids usually do when they are allowed to fall drop by drop into some very hot vessel.

After this I do not need to say anything with a view to explaining the movement of the heart, except that when its cavities are not full of blood there necessarily flows from the *vena cava* into the right cavity, and from the venous artery into the left, enough blood to keep these two vessels always full, and being full, that their orifices, which are turned towards the heart, cannot then be closed. But as soon as two drops of blood have thus entered, one into each of the cavities, these drops, which cannot be otherwise than very large, because the openings by which they enter are very wide and the vessels from whence they come are very full of blood, rarefy and dilate because of the heat which they find there. By this means, causing the whole heart to expand, they force home and close the five little doors which are at the entrances of the two vessels whence they flow, thus preventing any more blood from coming down into the heart and becoming more and more rarefied, they push open the six doors which are in the entrances of the two other vessels through which they make their exit, by this means causing {112} all the branches of the arterial vein and of the great artery to expand almost at the same instant as the heart. This last immediately afterward contracts as do also the arteries, because the blood which has entered them has cooled; and the six little doors close up again, and the five doors of the *vena cava* and of the venous artery re-open and make a way for two other drops of blood which cause the heart and the arteries once more to expand, just as we saw before. And because the blood which then enters the heart passes through these two pouches which are called auricles, it comes to pass that their movement is contrary to the movement of the heart, and that they contract when it expands. For the rest, in order that those who do not know the force of mathematical demonstration and are unaccustomed to distinguish true reasons from merely probable reasons, should not venture to deny what has been said without examination, I wish to acquaint them with the fact that this movement which I have just explained follows as necessarily from the very disposition of the organs, as can be seen by looking at the heart, and from the heat which can be felt with the fingers, and from the nature of the blood of which we can learn by experience, as does that of a clock from the power, the situation, and the form, of its counterpoise and of its wheels.

But if we ask how the blood in the veins does not exhaust itself in thus flowing continually into the heart, and how the arteries do not become too full of blood, since all that passes through the heart flows into them, I need only reply by stating what has already been written by an English physician,[6] to whom the credit of having broken the ice in this matter must be ascribed, as also of being the first to teach that there are many little tubes at the extremities of the arteries whereby the blood that they receive from the heart enters the little branches of the veins, whence it returns once more to the heart; in this way its course is just a perpetual circulation. He proves this very clearly by the common experience of surgeons, who, by binding the arm moderately firmly above the place where they open the vein, cause the blood to issue more abundantly than it would have done if they had not bound it at all; while quite a contrary result would occur if they bound it

below, between the hand and the opening, or if they bound it very firmly above. For it is clear that when the bandage is moderately tight, though it may prevent the blood already in the arm from {113} returning to the heart by the Veins, it cannot for all that prevent more blood from coming anew by the arteries, because these are situated below the veins, and their walls, being stronger, are less easy to compress; and also that the blood which comes from the heart tends to pass by means of the arteries to the band with greater force than it does to return from the band to the heart by the veins. And because this blood escapes from the arm by the opening which is made in one of the veins, there must necessarily be some passages below the ligature, that is to say, towards the extremities of the arm, through which it can come thither from the arteries. This physician likewise proves very clearly the truth of that which he says of the course of the blood, by the existence of certain little membranes or valves which are so arranged in different places along the course of the veins, that they do not permit the blood to pass from the middle of the body towards the extremities, but only to return from the extremities to the heart; and further by the experiment which shows that all the blood which is in the body may issue from it in a very short time by means of one single artery that has been cut, and this is so even when it is very tightly bound very near the heart, and cut between it and the ligature, so that there could be no ground for supposing that the blood which flowed out of it could proceed from any other place but the heart.

But there are many other things which demonstrate that the true cause of this motion of the blood is that which I have stated. To begin with, the difference which is seen between the blood which issues from the veins, and that which issues from the arteries, can only proceed from the fact, that, being rarefied, and so to speak distilled by passing through the heart, it is more subtle and lively, and warmer immediately after leaving the heart (that is to say, when in the arteries) than it is a little while before entering it (that is, when in the veins). And if attention be paid, we shall find that this difference does not appear clearly, excepting in the vicinity of the heart, and is not so clear in those parts which are further removed from it. Further, the consistency of,he coverings of which the arterial vein and the great artery are composed, shows clearly enough that the blood beats against them with more force than it does in the case of the veins. And why should the left cavity of the heart and the great artery be larger and wider than the right cavity and the arterial vein, if it is not that the blood of the venous artery having only been in the lungs since it had passed through the heart, is more subtle and rarefies more effectively and {114} easily than that which proceeds immediately from the *vena cava*? And what is it that the physicians can discover in feeling the pulse, unless they know that, according as the blood changes its nature, it may be rarefied by the warmth of the heart in a greater or less degree, and more or less quickly than before ? And if we inquire how this heat is communicated to the other members, must it not be allowed that it is by means of the blood which, passing through the heart, is heated once again and thence is spread throughout all the body? From this it happens that if we take away the blood from any particular part, by that same means we take away from it the heat; even if the heart were as ardent as a red hot iron it would not suffice to heat up the feet and hands as it actually does, unless it continually sent out to them new blood. We further understand from this that the true use of respiration is to carry sufficient fresh air into the lungs to cause the blood, which comes there from the right cavity of the heart, where it has been rarefied and so to speak transformed into vapors, to thicken, and become anew converted into blood before falling into the left cavity, without which process it would not be fit to serve as fuel for the fire which there exists. We are confirmed in this statement by seeing that the animals which have no lungs have also but one cavity in their hearts, and that in children, who cannot use them while still within their mother's wombs, there is an opening by

which the blood flows from the *vena cava* into the left cavity of the heart, and a conduit through which it passes from the arterial vein into the great artery without passing through the lung. Again, how could digestion be carried on in the stomach if the heart did not send heat there by the arteries, and along with this some of the more fluid parts of the blood which aid in dissolving the foods which have been there placed? And is not the action which converts the juice of foods into blood easy to understand if we consider that it is distilled by passing and repassing through the heart possibly more than one or two hundred times in a day? What further need is there to explain the process of nutrition and the production of the different humors which are in the body, if we can say that the force with which the blood, in being rarefied, passes from the heart towards the extremities of the arteries, causes some of its parts to remain among those of the members where they are found and there to take the place of others which they oust; and that according to the situation or form or smallness of the little pores which they encounter, certain ones proceed to certain parts rather than others, just as {115} a number of different sieves variously perforated, as everyone has probably seen, are capable of separating different species of grain? And finally what in all this is most remarkable of all, is the generation of the animal spirits, which resemble a very subtle wind, or rather a flame which is very pure and very vivid, and which, continually rising Up in great abundance from the heart to the brain, thence proceeds through the nerves to the muscles, thereby giving the power of motion to all the members. And it is Dot necessary to suppose any other cause to explain how the particles of blood, which, being most agitated and most penetrating, are the most proper to constitute these spirits, proceed towards the brain rather than elsewhere, than that the arteries which carry them thither are those which proceed from the heart in the most direct lines, and that according to the laws of Mechanics, which are identical with those of Nature, when many objects tend to move together to the same point, where there is not room for all (as is the case with the particles of blood which issue from the left cavity of the heart and tend to go towards the brain), the weakest and least agitated parts must necessarily be turned aside by those that are stronger, which by this means are the only ones to reach it.

I had explained all these matters in some detail in the Treatise which I formerly intended to publish. And afterwards I had shown there, what must be the fabric of the nerves and muscles of the human body in order that the animal spirits therein contained should have the power to move the members, just as the heads of animals, a little while after decapitation, are still observed to move and bite the earth, notwithstanding that they are no longer animate; what changes are necessary in the brain to cause wakefulness, sleep and dreams; how light, sounds, smells, tastes, heat and all other qualities pertaining to external objects are able to imprint on it various ideas by the intervention of the senses; how hunger, thirst and other internal affections can also convey their impressions upon it; what should be regarded as the "common sense" by which these ideas are received, and what is meant by the memory which retains them, by the fancy which can change them in diverse ways and out of them constitute new ideas, and which, by the same means, distributing the animal spirits through the muscles, can cause the members of such a body to move in as many diverse ways, and in a manner as suitable to the objects which present themselves to its senses and to its internal passions, as can happen in our own case apart from the direction of our free will. And this will not seem strange {116} to those, who, knowing how many different automata or moving machines can be made by the industry of man, without employing in so doing more than a very few parts in comparison with the great multitude of bones, muscles, nerves, arteries, veins, or other parts that are found in the body of each animal. From this aspect the body is regarded as a machine which, having been made by the hands of God, is incomparably better

arranged, and possesses in itself movements which are much more admirable, than any of those which can be invented by man. Here I specially stopped to show that if there had been such machines, possessing the organs and outward form of a monkey or some other animal without reason, we should not have had any means of ascertaining that they were not of the same nature as those animals. On the other hand, if there were machines which bore a resemblance to our body and imitated our actions as far as it was morally possible to do so, we should always have two very certain tests by which to recognize that, for all that, they were not real men. The first is, that they could never use speech or other signs as we do when placing our thoughts on record for the benefit of others. For we can easily understand a machine's being constituted so that it can utter words, and even emit some responses to action on it of a corporeal kind, which brings about a change in its organs; for instance, if it is touched in a particular part it may ask what we wish to say to it; if in another part it may exclaim that it is being hurt, and so on. But it never happens that it arranges its speech in various ways, in order to reply appropriately to everything that may be said in its presence, as even the lowest type of man can do. And the second difference is, that although machines can perform certain things as well as or perhaps better than any of us can do, they infallibly fan short in others, by the which means we may discover that they did not act from knowledge, but only from the disposition of their organs. For while reason is a universal instrument which can serve for all contingencies, these organs have need of some special adaptation for every particular action. From this it follows that it is morally impossible that there should be sufficient diversity in any machine to allow it to act in all the events of life in the same way as our reason causes us to act.

By these two methods we may also recognize the difference that exists between men and brutes. For it is a very remarkable fact that there are none so depraved and stupid, without even excepting idiots, that they cannot arrange different words together, {117} forming of them a statement by which they make known their thoughts; while, on the other hand, there is no other animal, however perfect and fortunately circumstanced it may be, which can do the same. It is not the want of organs that brings this to pass, for it is evident that ma.-Pies and parrots are able to utter words just like ourselves, and yet they cannot speak as we do, that is, so as to give evidence that they think of what they say. On the other hand, men who, being born deaf and dumb, are in the same degree, or even more than the brutes, destitute of the organs which serve the others for talking, are in the habit of themselves investing certain signs by which they make themselves understood by those who, being usually in their company, have leisure to learn their language. And this does not merely show that the brutes have less reason than men, but that they have none at all, since it is clear that very little is required in order to be able to talk. And when we notice the inequality that exists between animals of the same species, as well as between men, and observe that some are more capable of receiving instruction than others, it is not credible that a monkey or a parrot, selected as the most perfect of its species, should not in these matters equal the stupidest child to be found, or at least a child whose mind is clouded, unless in the case of the brute the soul were of an entirely different nature from ours. And we ought not to confound speech with natural movements which betray passions and may be imitated by machines as well as be manifested by animals; nor must we think, as did some of the ancients, that brutes talk, although we do not understand their language. For if this were true, since they have many organs which are allied to our own, they could communicate their thoughts to us just as easily as to those of their own race. It is also a very remarkable fact that although there are many animals which exhibit more dexterity than we do in some of their actions, we at the same time observe that they do not manifest any dexterity at all in

many others. Hence the fact that they do better than we do, does not prove that they are endowed with mind, for in this case they would have more reason than any of us, and would surpass us in all other things. It rather shows that they have no reason at all, and that it is nature which acts in them according to the disposition of their organs, just as a clock, which is only composed of wheels and weights is able to tell the hours and measure the time more correctly than we can do with all our wisdom.

I had described after this the rational soul and shown that it {118} could not be in any way derived from the power of matter, like the other things of which I had spoken, but that it must be expressly created. I showed, too, that it is not sufficient that it should be lodged in the human body like a pilot in his ship, unless perhaps for the moving of its members, but that it is necessary that it should also be joined and united more closely to the body in order to have sensations and appetites similar to our own, and thus to form a true man. In conclusion, I have here enlarged a little on the subject of the soul, because it is one of the greatest importance. For next to the error of those who deny God, which I think I have already sufficiently refuted, there is none which is more effectual in leading feeble spirits from the straight path of virtue, than to imagine that the soul of the brute is of the same nature as our own, and that in consequence, after this life we have nothing to fear or to hope for, any more than the flies and ants. As a matter of fact, when one comes to know how greatly they differ, we understand much better the reasons which go to prove that our soul is in its nature entirely independent of body, and in consequence that it is not liable to die with it. And then, inasmuch as we observe no other causes capable of destroying it, we are naturally inclined to judge that it is immortal.

Part VI

It is three years since I arrived at the end of the Treatise which contained all these things; and I was commencing to revise it in order to place it in the hands of a printer, when I learned that certain persons, to whose opinions I defer, and whose authority cannot have less weight with my actions than my own reason has over my thoughts, had disapproved of a physical theory published a little while before by another person.[7] I will not say that I agreed with this opinion, but only that before their censure I observed in it nothing which I could possibly imagine to be prejudicial either to Religion or the State, or consequently which could have prevented me from giving expression to it in writing, if my reason had persuaded me to do so: and this made me fear that among my own opinions one might be found which should be misunderstood, notwithstanding the great care which I have always taken not to accept any new beliefs unless I had very certain proof of their truth, and not to give expression to what could tend to the disadvantage {119} of any person. This sufficed to cause me to alter the resolution which I had made to publish. For, although the reasons for my former resolution were very strong, my inclination, which always made me hate the profession of writing books, caused me immediately to find plenty of other reasons for excusing myself from doing so. And these reasons, on the one side and on the other, are of such a nature that not only have I here some interest in giving expression to them, but possibly the public may also have some interest in knowing them.

I have never made much of those things which proceed from my own mind, and so long as I culled Do other fruits from the Method which I use, beyond that of satisfying myself respecting certain difficulties which pertain to the speculative sciences, or trying to regulate my conduct by the

reasons which it has taught me, I never believed myself to be obliged to write anything about it. For as regards that which concerns conduct, everyone is so confident of his own common sense, that there might be found as many reformers as heads, if it were permitted that others than those whom God has established as the sovereigns of his people, or at least to whom He has given sufficient grace and zeal to be prophets, should be allowed to make any changes in that. And, although my speculations give me the greatest pleasure, I believed that others also had speculations which possibly pleased them even more. But so soon as I had acquired some general notions concerning Physics, and as, beginning to make use of them in various special difficulties, I observed to what point they might lead us, and how much they differ from the principles of which we have made use up to the present time, I believed that I could not keep them concealed without greatly sinning against the law which obliges us to procure, as much as in us lies, the general good of all mankind. For they caused me to see that it is possible to attain knowledge which is very useful in life, and that, instead of that speculative philosophy which is taught in the Schools, we may find a practical philosophy by means of which, knowing the force and the action of fire, water, air, the stars, heavens and all other bodies that environ us, as distinctly as we know the different crafts of our artisans, we can in the same way employ them in all those uses to which they are adapted, and thus render ourselves the masters and possessors of nature. This is not merely to be desired with a view to the invention of an infinity of arts and crafts which enable us to enjoy without any trouble the fruits of the earth and all the good things which are to {120} be found there, but also principally because it brings about the preservation of health, which is without doubt the chief blessing and the foundation of all other blessings in this life. For the mind depends so much on the temperament and disposition of the bodily organs that, if it is possible to find a means of rendering men wiser and cleverer than they have hitherto been, I believe that it is in medicine that it must be sought. It is true that the medicine which is now in vogue contains little of which the utility is remarkable; but, without having any intention of decrying it, I am sure that there is no one, even among those who make its study a profession, who does not confess that all that men know is almost nothing in comparison with what remains to be known; and that we could be free of an infinitude of maladies both of body and mind, and even also possibly of the infirmities of age, if we had sufficient knowledge of their causes, and of all the remedies with which nature has provided us. But, having the intention of devoting all my life to the investigation of a knowledge which is so essential, and having discovered a path which appears to me to be of such a nature that we must by its means infallibly reach our end if we pursue it, unless, indeed, we are prevented by the shortness of life or by lack of experience, I judged that there was no better provision against these two impediments than faithfully to communicate to the public the little which I should myself have discovered, and to beg all well-inclined persons to proceed further by contributing, each one according to his own inclination and ability, to the experiments which must be made, and then to communicate to the public all the things which they might discover, in order that the last should commence where the preceding had left off; and thus, by joining together the lives and labors of many, we should collectively proceed much further than any one in particular could succeed in doing.

I remarked also respecting experiments, that they become so much the more necessary the more one is advanced in knowledge, for to begin with it is better to make use simply of those which present themselves spontaneously to our senses, and of which we could not be ignorant provided that we reflected ever so little, rather than to seek out those which are more rare and recondite; the reason of this is that those which are more rare often mislead us so long as we do not know the

causes of the more common, and the fact that the circumstances on which they depend are almost always so particular and so minute that it is very difficult to observe {121} them. But in this the order which I have followed is as follows: I have first tried to discover generally the principles or first causes of everything that is or that can be in the world, without considering anything that might accomplish this end but God Himself who has created the world, or deriving them from any source excepting from certain germs of truths which are naturally existent in our souls. After that I considered which were the primary and most ordinary effects which might be deduced from these causes, and it seems to me that in this way I discovered the heavens, the stars, an earth, and even on the earth, water, air, fire, the minerals and some other such things, which are the most common and simple of any that exist, and consequently the easiest to know. Then, when I wished to descend to those which were more particular, so many objects of various kinds presented themselves to me, that I did not think it was possible for the human mind to distinguish the forms or species of bodies which are on the earth from an infinitude of others which might have been so if it had been the will of God to place them there, or consequently to apply them to our use, if it were not that we arrive at the causes by the effects, and avail ourselves of many particular experiments. In subsequently passing over in my mind all the objects which have ever been presented to my senses, I can truly venture to say that I have not there observed anything which I could not easily explain by the principles which I had discovered. But I must also confess that the power of nature is so ample and so vast, and these principles are so simple and general, that I observed hardly any particular effect as to which I could not at once recognize that it might be deduced from the principles in many different ways; and my greatest difficulty is usually to discover in which of these ways the effect does depend upon them. As to that, I do not know any other plan but again to try to find experiments of such a nature that their result is not the same if it has to be explained by one of the methods, as it would be if explained by the other. For the rest, I have now reached a position in which I discern, as it seems to me, sufficiently clearly what course must be adopted in order to make the majority of the experiments which may conduce to carry out this end. But I also perceive that they are of such a nature, and of so great a number, that neither my hands nor my income, though the latter were a thousand times larger than it is, could suffice for the whole; so that just in proportion as henceforth I shall have the power of carrying out more of them or less, shall I make more or less progress in arriving at a knowledge {122} of nature. This is what I had promised myself to make known by the Treatise which I had written, and to demonstrate in it so clearly the advantage which the public might receive from it, that I should induce all those who have the good of mankind at heart-that is to say, all those who are really virtuous in fact, and not only by a false semblance or by opinion-both to communicate to me those experiments that they have already carried out, and to help me in the investigation of those that still remain to be accomplished.

But I have since that time found other reasons which caused me to change my opinion, and consider that I should indeed continue to put in writing all the things which I judged to be of importance whenever I discovered them to be true, and that I should bestow on them the same care as I should have done had I wished to have them printed. I did this because it would give me so much the more occasion to examine them carefully (for there is no doubt that we always scrutinize more closely what we think will be seen by many, than what is done simply for ourselves, and often the things which have seemed true to me when I began to think about them, seemed false when I tried to place them on paper); and because I did not desire to lose any opportunity of benefiting the public if I were able to do so, and in order that if my works have any value, those into whose hands they will fall after my death, might have the power of making use of them as seems best to them. I,

however, resolved that I should not consent to their being published during my lifetime, so that neither the contradictions and controversies to which they might possibly give rise, nor even the reputation, such as it might be, which they would bring to me, should give me any occasion to lose the time which I meant to set apart for my own instruction. For although it is true that each man is obliged to procure, as much as in him lies, the good of others, and that to be useful to nobody is popularly speaking to be worthless, it is at the same time true that our cares should extend further than the present time, and that it is good to set aside those things which may possibly be adapted to bring profit to the living, when we have in view the accomplishment of other ends which will bring much more advantage to our descendants. In the same wry I should much like that men should know that the little which I have learned hitherto is almost nothing in comparison with that of which I am ignorant, and with the knowledge of which I do not despair of being able to attain. For it is much the same with those who little by little discover the truth in the Sciences, as with those who, {123} commencing to become rich, have less trouble in obtaining great acquisitions than they formerly experienced, when poorer, in arriving at those much smaller in amount. Or we might compare them to the Generals of our armies, whose forces usually grow ill proportion to their victories, and who require more leadership in order to hold together their troops after the loss of a battle, than is needed to take towns and provinces after having obtained a success. For he really gives battle who attempts to conquer all the difficulties and errors which prevent him from arriving at a knowledge of the truth, and it is to lose a battle to admit a false opinion touching a matter of any generality and importance. Much more skill is required in order to recover the position that one beforehand held, than is necessary to make great progress when one already possesses principles which are assured. For myself, if I have succeeded in discovering certain truths in the Sciences (and I hope that the matters contained in this volume will show that I have discovered some), I may say that they are resultant from, and dependent on, five or six principal difficulties which I have surmounted, and my encounter with these I look upon as so many battles in which I have had fortune on my side. I will not even hesitate to say that I think I shall have no need to win more than two or three other victories similar in kind in order to reach the accomplishment of my plans. And my age is not so advanced but that, in the ordinary course of nature, I may still have sufficient leisure for this end. But I believe myself to be so much the more bound to make the most of the time which remains, as I have the greater hope of being able to employ it well. And without doubt I should have many chances of being robbed of it, were I to publish the foundations of my Physics; for though these are nearly all so evident that it is only necessary to understand them in order to accept them, and although there are none of them as to which I do not believe myself capable of giving demonstration, yet because it is impossible that they should accord with all the various opinions of other men, I foresee that I should often be diverted from my main design by the opposition which they would bring to birth.

We may say that these contradictions might be useful both in making me aware of my errors, and, supposing that I had reached some satisfactory conclusion in bringing others to a fuller understanding of my speculations; and, as many can see more than can a single man, they might help in leading others who from the present time may begin to avail themselves of my system, to assist {124} me likewise with their discoveries. But though I recognize that I am extremely liable to err, and though I almost never trust the first reflections that I arrive at, the experience which I have had of the objections which may be made to my system prevents my having any hope of deriving profit from them. For I have often had experience of the judgments both of those whom I have esteemed as my friends, and of some others to whom I believed myself to be indifferent, and

even, too, of some whose ill-feeling and envy would, I felt sure, make them endeavor to reveal what affection concealed from the eyes of my friends. But rarely has it happened that any objection has been made which I did not in some sort foresee, unless where it was something very far removed from my subject. In this way hardly ever have I encountered any censor of my opinions who did not appear to me to be either less rigorous or less judicial than myself. And I certainly never remarked that by means of disputations employed by the Schools any truth has been discovered of which we were formerly ignorant. And so long as each side attempts to vanquish his opponent, there is a much more serious attempt to establish probability than to weigh the reasons on either side; and those who have for long been excellent pleaders are not for that reason the best judges.

As to the advantage which others may receive from the communication of my reflections, it could not be very great, inasmuch as I have not yet carried them so far as that it is not necessary to add many things before they can be brought into practice. And I think I can without vanity say that if anyone is capable of doing this, it should be myself rather than another-not indeed that there may not be in the world many minds incomparably superior to my own, but because no one can so well understand a thing and make it his own when learnt from another as when it is discovered for himself. As regards the matter in hand there is so much truth in this, that although I have often explained some of my opinions to persons of very good intelligence, who, while I talked to them appeared to understand them very clearly, yet when they recounted them I remarked that they had almost always altered them in such a manner that I could no longer acknowledge them as mine. On this account I am very glad to have the opportunity here of begging my descendants never to believe that what is told to them proceeded from myself unless I have myself divulged it. And I do not in the least wonder at the extravagances attributed to all the ancient philosophers whose writings we do not possess, nor do I judge from {125} these that their thoughts were very unreasonable, considering that theirs were the best minds of the time they lived in, but only that they have been imperfectly represented to us. We see, too, that it hardly ever happens that any of their disciples surpassed them, and I am sure that those who most passionately follow Aristotle now-a-days would think themselves happy if they had as much knowledge of nature as he had, even if this were on the condition that they should never attain to any more. They are like the ivy that never tries to mount above the trees which give it support, and which often even descends again after it has reached their summit; for it appears to me that such men also sink again-that is to say, somehow render themselves more ignorant than they would have been had they abstained from study altogether. For, not content with knowing all that is intelligibly explained in their author, they wish in addition to find in him the solution of many difficulties of which he says nothing, and in regard to which he possibly had no thought at all. At the same time their mode of philosophizing is very convenient for those who have abilities of a very mediocre kind, for the obscurity of the distinctions and principles of which they make use, is the reason of their being able to talk of all things as boldly as though they really knew about them, and defend all that they say against the most subtle and acute, without any one having the means of convincing them to the contrary. In this they seem to me like a blind man who, in order to fight on equal terms with one who sees, would have the latter to come into the bottom of a very dark cave. I may say, too, that it is in the interest of such people that I should abstain from publishing the principles of philosophy of which I make use, for, being so simple and evident as they are, I should, in publishing them, do the same as though I threw open the windows and caused daylight to enter the cave into which they have descended in order to fight. But even the best minds have no reason to desire to be acquainted with these principles, for if they wish to be able to talk of everything and acquire a reputation for

learning, they will more readily attain their end by contenting themselves with the appearance of truth which may be found in all sorts of things without much trouble, than in seeking for truth which only reveals itself little by little in certain spheres, and which, when others come into question, obliges one to confess one's ignorance. If, however, they prefer the knowledge of some small amount of truth to the vanity of seeming to be ignorant of nothing, which knowledge is {126} doubtless preferable, or if they desire to follow a course similar to my own, it is not necessary that I should say any more than what I have already said in this Discourse. For if they are capable of passing beyond the point I have reached, they will also so much the more be able to find by themselves all that I believe myself to have discovered; since, not having examined anything but in its order, it is certain that what remains for me to discover is in itself more difficult and more recondite than anything that I have hitherto been able to meet with, and they would have much less pleasure in learning from me than from themselves. Besides, the habit which they will acquire of seeking first things that are simple and then little by little and by degrees passing to others more difficult, will be of more use than could be all my instructions. For, as regards myself, I am persuaded that if from my youth up I had been taught all the truths of which I have since sought the demonstrations, or if I had not had any difficulty in learning them, I should perhaps never have known any others, or at least I should never have acquired the habit or facility which I think I have obtained, of ever finding them anew, in proportion as I set myself to seek for them. And, in a word, if there is any work at all which cannot be so well achieved by another as by him who has begun it, it is that at which I labor.

It is true as regards the experiments which may conduce to this end, that one man could not possibly accomplish all of them. But yet he could not, to good advantage, employ other hands than his own, excepting those of artisans or persons of that kind whom he could pay, and whom the hope of gain-which is a very effectual incentive-might cause to perform with exactitude all the things they were directed to accomplish. As to those who, whether by curiosity or desire to learn, might possibly offer him their voluntary assistance, not only are they usually more ready with promises than with performance, planning out fine sounding projects, none of which are ever realized, but they will also infallibly demand payment for their trouble by requesting the explanation of certain difficulties, or at least by empty compliments and useless talk, which could not occupy any of the student's time without causing it to be lost. And as to the experiments already made by others, even if they desired to communicate these to him-which those who term them secrets would never do-they are for the most part accompanied by so many circumstances or superfluous matter, that it would be very difficult for him to disentangle the truth. In addition to this he {127} would find nearly all so badly explained, or even so false (because those who carried them out were forced to make them appear to be in conformity with their principles), that if there had been some which might have been of use to him, they would hardly be worth the time that would be required in making the selection. So true is this, that if there were anywhere in the world a person whom one knew to be assuredly capable of discovering matters of the highest importance and those of the greatest possible utility to the public, and if for this reason all other men were eager by every means in their power to help him in reaching the end which he set before him, I do not see that they could do anything for him beyond contributing to defray the expenses of the experiments which might be requisite, or, for the rest, seeing that he was not deprived of his leisure by the importunities of anyone. But, in addition to the fact that I neither esteem myself so highly as to be willing to promise anything extraordinary, nor give scope to an imagination so vain as to conceive that the public should interest itself greatly in my designs, I do not yet own a soul so base

as to be willing to accept from anyone whatever a favor which it might be supposed I did not merit.

All those considerations taken together were, three years ago, the cause of my not desiring to publish the Treatise which I had on hand, and the reason why I even formed the resolution of not bringing to light during my life any other of so general a kind, or one by which the foundations of Physics could be understood. But since then two other reasons came into operation which compelled me to bring forward certain attempts, as I have done here, and to render to the public some account of my actions and designs. The first is that if I failed to do so, many who knew the intention I formerly had of publishing certain writings, might imagine that the causes for which I abstained from so doing were more to my disadvantage than they really were; for although I do not care immoderately for glory, or, if I dare say so, although I even hate it, inasmuch as I judge it to be antagonistic to the repose which I esteem above all other things, at the same time I never tried to conceal my actions as though they were crimes, nor have I used many precautions against being known, partly because I should have thought it damaging to myself, and partly because it would have given me a sort of disquietude which would again have militated against the perfect repose of spirit which I seek. And for as much as having in this way always held myself in a condition of indifference as {128} regards whether I was known or was not known, I have not yet been able to prevent myself from acquiring some sort of reputation, I thought that I should do my best at least to prevent myself from acquiring an evil reputation. The other reason which obliged me to put this in writing is that I am becoming every day more and more alive to t-he delay which is being suffered in the design which I have of instructing myself, because of the lack of an infinitude of experiments, which it is impossible that I should perform without the aid of others: and although I do not flatter myself so much as to hope that the public should to any large degree participate in my interest, I yet do not wish to be found wanting, both on my own account, and as one day giving occasion to those who will survive me of reproaching me for the fact that I might have left many matters in a much better condition than I have done, had I not too much neglected to make them understand in what way they could have contributed to the accomplishment of my designs.

And I thought that it was easy for me to select certain matters which would not be the occasion for many controversies, nor yet oblige me to propound more of my principles than I wish, and which yet would suffice to allow a pretty clear manifestation of what I can do and what I cannot do in the sciences. In this I cannot say whether I have succeeded or have not succeeded, and I do not wish to anticipate the judgment of any one by myself speaking of my writings; but I shall be very glad if they will examine them. And in order that they may have the better opportunity of so doing, I beg all those who have any objections to offer to take the trouble of sending them to my publishers, so that, being made aware of them, I may try at the same time to subjoin my reply. By this means, the reader, seeing objections and reply at the same time, will the more easily judge of the truth; for I do not promise in any instance to make lengthy replies, but just to avow my errors very frankly if I am convinced of them; or, if I cannot perceive them, to say simply what I think requisite for the defense of the matters I have written, without adding the exposition of any new matter, so that I may not be endlessly engaged in passing from one side to the other.

If some of the matters of which I spoke in the beginning of the *Dioptrics* and *Meteors* should at first sight give offense because I call them hypotheses and do not appear to care about their proof, let them have the patience to read these in entirety, and I hope that they will find themselves satisfied. For it appears to me that {129} the reasonings are so mutually interwoven, that as the later ones are demonstrated by the earlier, which are their causes, the earlier are reciprocally demonstrated by the later which are their effects. And it must not be imagined that in this I commit the fallacy

which logicians name arguing in a circle, for, since experience renders the greater part of these effects very certain, the causes from which I deduce them do not so much serve to prove their existence as to explain them; on the other hand, the causes are explained by the effects. And I have not named them hypotheses with any other object than that it may be known that while I consider myself able to deduce them from the primary truths which I explained above, yet I particularly desired not to do so, in order that certain persons may not for this reason take occasion to build up some extravagant philosophic system on what they take to be my principles, and thus cause the blame to be put on me. I refer to those who imagine that in one day they may discover all that another has arrived at in twenty years of work, so soon as he has merely spoken to them two or three words on the subject; while they are really all the more subject to err, and less capable of perceiving the truth as they are the more subtle and lively. For as regards the opinions that are truly mine I do not apologize for them as being new, inasmuch as if we consider the reasons of them well, I assure myself that they will be found to be so simple and so conformable to common sense, as to appear less extraordinary and less paradoxical than any others which may be held on similar subjects. And I do not even boast of being the first discoverer of any of them, but only state that I have adopted them, not because they have been held by others, nor because they have not been so held, but only because Reason has persuaded me of their truth.

Even if artisans are not at once able to carry out the invention[8] explained in the *Dioptrics*, I do not for that reason think that it can be said that it is to be condemned; for, inasmuch as great address and practice is required to make and adjust the mechanism which I have described without omitting any detail, I should not be less astonished at their succeeding at the first effort than I should be supposing some one were in one day to learn to play the guitar with skill, just because a good sheet of musical notation were set up before him. And if I write in French which is the language of my country, rather than in Latin which is that of my teachers, that is {130} because I hope that those who avail themselves only of their natural reason in its purity may be better judges of my opinions than those who believe only in the writings of the ancients; and as to those who unite good sense with study, whom alone I crave for my judges, they will not, I feel sure, be so partial to Latin as to refuse to follow my reasoning because I expound it in a vulgar tongue.

For the rest, I do not desire to speak here more particularly of the progress which I hope in the future to make in the sciences, nor to bind myself as regards the public with any promise which I shall not with certainty be able to fulfill. But I will just say that I have resolved not to employ the time which remains to me in life in any other matter than in endeavoring to acquire some knowledge of nature, which shall be of such a kind that it will enable us to arrive at rules for Medicine more assured than those which have as yet been attained; and my inclination is so strongly opposed to any other kind of pursuit, more especially to those which can only be useful to some by being harmful to others, that if certain circumstances had constrained me to employ them, I do not think that I should have been capable of succeeding. In so saying I make a declaration that I know very well cannot help me to make myself of consideration in the world, but to this end I have no desire to attain; and I shall always hold myself to be more indebted to those by whose favor I may enjoy my leisure without hindrance, than I shall be to any who may offer me the most honorable position in all the world.

Meditations On First Philosophy

Rene Descartes

1641

1/20/96

CONTENTS

Prefatory Note To The Meditations.

The first edition of the *Meditations* was published in Latin by Michael Soly of Paris *at the Sign of the Phoenix* in 1641 cum Privilegio et Approbatione Doctorum. The Royal *privilege* was indeed given, but the *approbation* seems to have been of a most indefinite kind. The reason of the book being published in France and not in Holland, where Descartes was living in a charming country house at Endegeest near Leiden, was apparently his fear that the Dutch ministers might in some way lay hold of it. His friend, Pere Mersenne, took charge of its publication in Paris and wrote to him about any difficulties that occurred in the course of its progress through the press. The second edition was however published at Amsterdam in 1642 by Louis Elzevir, and this edition was accompanied by the now completed *Objections and Replies.*[2] The edition from which the present translation is made is the second just mentioned, and is that adopted by MM. Adam and Tannery as the more correct, for reasons that they state in detail in the preface to their edition. The work was translated into French by the Duc de Luynes in 1642 and Descartes considered the translation so excellent that he had it published some years later. Clerselier, to complete matters, had the *Objections* also published in French with the *Replies,* and this, like the other, was subject to Descartes' revision and correction. This revision renders the French edition specially valuable. Where it seems desirable an alternative reading from the French is given in square brackets.

Elizabeth S. Haldane

Dedication

To the Most Wise and Illustrious the Dean and Doctors of the Sacred Faculty of Theology in Paris.

The motive which induces me to present to you this Treatise is so excellent, and, when you become acquainted with its design, I am convinced that you will also have so excellent a motive for taking it under your protection, that I feel that I cannot do better, in order to render it in some sort acceptable to you, than in a few words to state what I have set myself to do.

I have always considered that the two questions respecting God and the Soul were the chief of those that ought to be demonstrated by philosophical rather than theological argument. For although it is quite enough for us faithful ones to accept by means of faith the fact that the human soul does not perish with the body, and that God exists, it certainly does not seem possible ever to persuade infidels of any religion, indeed, we may almost say, of any moral virtue, unless, to begin with, we prove these two facts by means of the natural reason. And inasmuch as often in this life greater rewards are offered for vice than for virtue, few people would prefer the right to the useful, were they restrained neither by the fear of God nor the expectation of another life; and although it is absolutely true that we must believe that there is a God, because we are so taught in the Holy Scriptures, and, on the other hand, that we must believe the Holy Scriptures because they come from God (the reason of this is, that, faith being a gift of God, He who gives the grace to cause us to believe other things can likewise give it to cause us to believe that He exists), we nevertheless could

not place this argument before infidels, who might accuse us of reasoning in a circle. And, in truth, I have noticed that you, along with all the theologians, did not only affirm that the existence of God may be proved by the natural reason, but also that it may be inferred from the Holy Scriptures, that knowledge about Him is much clearer than that which we have of many created things, and, as a matter of fact, is so easy to acquire, that those who have it not are culpable in their ignorance. This indeed appears from the Wisdom of Solomon, chapter xiii., where it is said *Howbeit they are not to be excused; for if their understanding was so great that they could discern the world and the creatures, why did they not rather find out the Lord thereof?* and in Romans, chapter i., it is said that they are *without excuse*; and again in the same place, by these words *that which may be known of God is manifest in them,* it seems as through we were shown that all that which can be known of God may be made manifest by means which are not derived from anywhere but from ourselves, and from the simple consideration of the nature of our minds. Hence I thought it not beside my purpose to inquire how this is so, and how God may be more easily and certainly known than the things of the world.

And as regards the soul, although many have considered that it is not easy to know its nature, and some have even dared to say that human reasons have convinced us that it would perish with the body, and that faith alone could believe the contrary, nevertheless, inasmuch as the Lateran Council held under Leo X (in the eighth session) condemns these tenets, and as Leo expressly ordains Christian philosophers to refute their arguments and to employ all their powers in making known the truth, I have ventured in this treatise to undertake the same task.

More than that, I am aware that the principal reason which causes many impious persons not to desire to believe that there is a God, and that the human soul is distinct from the body, is that they declare that hitherto no one has been able to demonstrate these two facts; and although I am not of their opinion but, on the contrary, hold that the greater part of the reasons which have been brought forward concerning these two questions by so many great men are, when they are rightly understood, equal to so many demonstrations, and that it is almost impossible to invent new ones, it is yet in my opinion the case that nothing more useful can be accomplished in philosophy than once for all to seek with care for the best of these reasons, and to set them forth in so clear and exact a manner, that it will henceforth be evident to everybody that they are veritable demonstrations. And, finally, inasmuch as it was desired that I should undertake this task by many who were aware that I had cultivated a certain Method for the resolution of difficulties of every kind in the Sciences -- a method which it is true is not novel, since there is nothing more ancient than the truth, but of which they were aware that I had made use successfully enough in other matters of difficulty -- I have thought that it was my duty also to make trial of it in the present matter.

Now all that I could accomplish in the matter is contained in this Treatise. Not that I have here drawn together all the different reasons which might be brought forward to serve as proofs of this subject: for that never seemed to be necessary excepting when there was no one single proof that was certain. But I have treated the first and principal ones in such a manner that I can venture to bring them forward as very evident and very certain demonstrations. And more than that, I will say that these proofs are such that I do not think that there is any way open to the human mind by which it can ever succeed in discovering better. For the importance of the subject, and the glory of God to which all this relates, constrain me to speak here somewhat more freely of myself than is my habit. Nevertheless, whatever certainty and evidence I find in my reasons, I cannot persuade myself that all the world is capable of understanding them. Still, just as in Geometry there are

many demonstrations that have been left to us by Archimedes, by Apollonius, by Pappus, and others, which are accepted by everyone as perfectly certain and evident (because they clearly contain nothing which, considered by itself, is not very easy to understand, and as all through that which follows has an exact connection with, and dependence on that which precedes), nevertheless, because they are somewhat lengthy, and demand a mind wholly devoted tot heir consideration, they are only taken in and understood by a very limited number of persons. Similarly, although I judge that those of which I here make use are equal to, or even surpass in certainty and evidence, the demonstrations of Geometry, I yet apprehend that they cannot be adequately understood by many, both because they are also a little lengthy and dependent the one on the other, and principally because they demand a mind wholly free of prejudices, and one which can be easily detached from the affairs of the senses. And, truth to say, there are not so many in the world who are fitted for metaphysical speculations as there are for those of Geometry. And more than that; there is still this difference, that in Geometry, since each one is persuaded that nothing must be advanced of which there is not a certain demonstration, those who are not entirely adepts more frequently err in approving what is false, in order to give the impression that they understand it, than in refuting the true. But the case is different in philosophy where everyone believes that all is problematical, and few give themselves to the search after truth; and the greater number, in their desire to acquire a reputation for boldness of thought, arrogantly combat the most important of truths.[3]

That is why, whatever force there may be in my reasonings, seeing they belong to philosophy, I cannot hope that they will have much effect on the minds of men, unless you extend to them your protection. But the estimation in which you Company is universally held is so great, and the name of Sorbonne carries with it so much authority, that, next to the Sacred Councils, never has such deference been paid to the judgment of any Body, not only in what concerns the faith, but also in what regards human philosophy as well: everyone indeed believes that it is not possible to discover elsewhere more perspicacity and solidity, or more integrity and wisdom in pronouncing judgment. For this reason I have no doubt that if you deign to take the trouble in the first place of correcting this work (for being conscious not only of my infirmity, but also of my ignorance, I should not dare to state that it was free from errors), and then, after adding to it these things that are lacking to it, completing those which are imperfect, and yourselves taking the trouble to give a more ample explanation of those things which have need of it, or at least making me aware of the defects so that I may apply myself to remedy them[4] -- when this is done and when finally the reasonings by which I prove that there is a God, and that the human soul differs from the body, shall be carried to that point of perspicuity to which I am sure they can be carried in order that they may be esteemed as perfectly exact demonstrations, if you deign to authorize your approbation and to render public testimony to their truth and certainty, I do not doubt, I say, that henceforward all the errors and false opinions which have ever existed regarding these two questions will soon be effaced from the minds of men. For the truth itself will easily cause all men of mind and learning to subscribe to your judgment; and your authority will cause the atheists, who are usually more arrogant than learned or judicious, to rid themselves of their spirit of contradiction or lead them possibly themselves to defend the reasonings which they find being received as demonstrations by all persons of consideration, lest they appear not to understand them. And, finally, all others will easily yield to such a mass of evidence, and there will be none who dares to doubt the existence of God and the real and true distinction between the human soul and the body. It is for you now in your singular wisdom to judge of the importance of the establishment of such beliefs [you who see

the disorders produced by the doubt of them][5] . But it would not become me to say more in consideration of the cause of God and religion to those who have always been the most worthy supports of the Catholic Church.

Preface to the Reader

I have already slightly touched on these two questions of God and the human soul in the Discourse on the Method of rightly conducting the Reason and seeking truth in the Sciences, published in French in the year 1637. Not that I had the design of treating these with any thoroughness, but only so to speak in passing, and in order to ascertain by the judgment of the readers how I should treat them later on. For these questions have always appeared to me to be of such importance that I judged it suitable to speak of them more than once; and the road which I follow in the explanation of them is so little trodden, and so far removed from the ordinary path, that I did not judge it to be expedient to set it forth at length in French and in a Discourse which might be read by everyone, in case the feebler minds should believe that it was permitted to them to attempt to follow the same path.

But, having in this Discourse on Method begged all those who have found in my writings somewhat deserving of censure to do me the favour of acquainting me with the grounds of it, nothing worthy of remark has been objected to in them beyond two matters: to these two I wish here to reply in a few words before undertaking their more detailed discussion.

The first objection is that it does not follow from the fact that the human mind reflecting on itself does not perceive itself to be other than a thing that thinks, that its nature or its essence consists only in its being a thing that thinks, in the sense that this word only excludes all other things which might also be supposed to pertain to the nature of the soul. To this objection I reply that it was not my intention in that place to exclude these in accordance with the order that looks to the truth of the matter (as to which I was not then dealing), but only in accordance with the order of my thought [perception]; thus my meaning was that so far as I was aware, I knew nothing clearly as belonging to my essence, excepting that I was a thing that thinks, or a thing that has in itself the faculty of thinking. But I shall show hereafter how from the fact that I know no other thing which pertains to my essence, it follows that there is no other thing which really does belong to it.

The second objection is that it does not follow from the fact that I have in myself the idea of something more perfect than I am, that this idea is more perfect than I, and much less that what is represented by this idea exists. But I reply that in this term idea there is here something equivocal, for it may either be taken materially, as an act of my understanding, and in this sense it cannot be said that it is more perfect than I; or it may be taken objectively, as the thing which is represented by this act, which, although we do not suppose it to exist outside of my understanding, may, none the less, be more perfect than I, because of its essence. And in following out this Treatise I shall show more fully how, from the sole fact that I have in myself the idea of a thing more perfect than myself, it follows that this thing truly exists.

In addition to these two objections I have also seen two fairly lengthy works on this subject, which, however, did not so much impugn my reasonings as my conclusions, and this by arguments drawn from the ordinary atheistic sources. But, because such arguments cannot make any impression on

the minds of those who really understand my reasonings, and as the judgments of many are so feeble and irrational that they very often allow themselves to be persuaded by the opinions which they have first formed, however false and far removed from reason they may be, rather than by a true and solid but subsequently received refutation of these opinions, I do not desire to reply here to their criticisms in case of being first of all obliged to state them. I shall only say in general that all that is said by the atheist against the existence of God, always depends either on the fact that we ascribe to God affections which are human, or that we attribute so much strength and wisdom to our minds that we even have the presumption to desire to determine and understand that which God can and ought to do. In this way all that they allege will cause us no difficulty, provided only we remember that we must consider our minds as things which are finite and limited, and God as a Being who is incomprehensible and infinite.

Now that I have once for all recognised and acknowledged the opinions of men, I at once begin to treat of God and the Human soul, and at the same time to treat of the whole of the First Philosophy, without however expecting any praise from the vulgar and without the hope that my book will have many readers. On the contrary, I should never advise anyone to read it excepting those who desire to meditate seriously with me, and who can detach their minds from affairs of sense, and deliver themselves entirely from every sort of prejudice. I know too well that such men exist in a very small number. But for those who, without caring to comprehend the order and connections of my reasonings, form their criticisms on detached portions arbitrarily selected, as is the custom with many, these, I say, will not obtain much profit from reading this Treatise. And although they perhaps in several parts find occasion of cavilling, they can for all their pains make no objection which is urgent or deserving of reply.

And inasmuch as I make no promise to others to satisfy them at once, and as I do not presume so much on my own powers as to believe myself capable of foreseeing all that can cause difficulty to anyone, I shall first of all set forth in these Meditations the very considerations by which I persuade myself that I have reached a certain and evident knowledge of the truth, in order to see if, by the same reasons which persuaded me, I can also persuade others. And, after that, I shall reply to the objections which have been made to me by persons of genius and learning to whom I have sent my Meditations for examination, before submitting them to the press. For they have made so many objections and these so different, that I venture to promise that it will be difficult for anyone to bring to mind criticisms of any consequence which have not been already touched upon. This is why I beg those who read these Meditations to form no judgment upon them unless they have given themselves the trouble to read all the objections as well as the replies which I have made to them.[6]

Synopsis of the Six Following Meditations.

In the first Meditation I set forth the reasons for which we may, generally speaking, doubt about all things and especially about material things, at least so long as we have no other foundations for the sciences than those which we have hitherto possessed. But although the utility of a Doubt which is so general does not at first appear, it is at the same time very great, inasmuch as it delivers us from every kind of prejudice, and sets out for us a very simple way by which the mind may detach itself from the senses; and finally it makes it impossible for us ever to doubt those things which we have once discovered to be true.

In the second Meditation, mind, which making use of the liberty which pertains to it, takes for granted that all those things of whose existence it has the least doubt, are non-existent, recognises that it is however absolutely impossible that it does not itself exist. This point is likewise of the greatest moment, inasmuch as by this means a distinction is easily drawn between the things which pertain to mind -- that is to say to the intellectual nature -- and those which pertain to body.

But because it may be that some expect from me in this place a statement of the reasons establishing the immortality of the soul, I feel that I should here make known to them that having aimed at writing nothing in all this Treatise of which I do not possess very exact demonstrations, I am obliged to follow a similar order to that made use of by the geometers, which is to begin by putting forward as premises all those things upon which the proposition that we seek depends, before coming to any conclusion regarding it. Now the first and principal matter which is requisite for thoroughly understanding the immortality of the soul is to form the clearest possible conception of it, and one which will be entirely distinct from all the conceptions which we may have of body; and in this Meditation this has been done. In addition to this it is requisite that we may be assured that all the things which we conceive clearly and distinctly are true in the very way in which we think them; and this could not be proved previously to the Fourth Mediation. Further we must have a distinct conception of corporeal nature, which is given partly in this Second, and partly in the Fifth and Sixth Meditations. And finally we should conclude from all this, that those things which we conceive clearly and distinctly as being diverse substances, as we regard mind and body to be, are really substances essentially distinct one from the other; and this is the conclusion of the Sixth Meditation. This is further confirmed in this same Meditation by the fact that we cannot conceive of body excepting in so far as it is divisible, while the mind cannot be conceived of excepting as indivisible. For we are not able to conceive of the half of a mind as we can do of the smallest of all bodies; so that we see that not only are their natures different but even in some respects contrary to one another. I have not however dealt further with this matter in this treatise, both because what I have said is sufficient to show clearly enough that the extinction of the mind does not follow from the corruption of the body, and also to give men the hope of another life after death, as also because the premises from which the immortality of the soul may be deduced depend on an elucidation of a complete system of Physics. This would mean to establish in the first place that all substances generally -- that is to say all things which cannot exist without being created by God -- are in their nature incorruptible, and that they can never cease to exist unless God, in denying to them his concurrence, reduce them to nought; and secondly that body, regarded generally, is a substance, which is the reason why it also cannot perish, but that the human body, inasmuch as it differs from other bodies, is composed only of a certain configuration of members and of other similar accidents, while the human mind is not similarly composed of any accidents, but is a pure substance. For although all the accidents of mind be changed, although, for instance, it think certain things, will others, perceive others, etc., despite all this it does not emerge from these changes another mind: the human body on the other hand becomes a different thing from the sole fact that the figure or form of any of its portions is found to be changed. From this it follows that the human body may indeed easily enough perish, but the mind [or soul of man (I make no distinction between them)] is owing to its nature immortal.

In the third Meditation it seems to me that I have explained at sufficient length the principal argument of which I make use in order to prove the existence of God. But none the less, because I did not wish in that place to make use of any comparisons derived from corporeal things, so as to withdraw as much as I could the minds of readers from the senses, there may perhaps have

remained many obscurities which, however, will, I hope, be entirely removed by the Replies which I have made to the Objections which have been set before me. Amongst others there is, for example, this one, How the idea in us of a being supremely perfect possesses so much objective reality [that is to say participates by representation in so many degrees of being and perfection] that it necessarily proceeds from a cause which is absolutely perfect. This is illustrated in these Replies by the comparison of a very perfect machine, the idea of which is found in the mind of some workman. For as the objective contrivance of this idea must have some cause, i.e. either the science of the workman or that of some other from whom he has received the idea, it is similarly impossible that the idea of God which is in us should not have God himself as its cause.

In the fourth Meditation it is shown that all these things which we very clearly and distinctly perceive are true, and at the same time it is explained in what the nature of error or falsity consists. This must of necessity be known both for the confirmation of the preceding truths and for the better comprehension of those that follow. (But it must meanwhile be remarked that I do not in any way there treat of sin -- that is to say of the error which is committed in the pursuit of good and evil, but only of that which arises in the deciding between the true and the false. And I do not intend to speak of matters pertaining to the Faith or the conduct of life, but only of those which concern speculative truths, and which may be known by the sole aid of the light of nature.)

In the fifth Meditation corporeal nature generally is explained, and in addition to this the existence of God is demonstrated by a new proof in which there may possibly be certain difficulties also, but the solution of these will be seen in the Replies to the Objections. And further I show in what sense it is true to say that the certainty of geometrical demonstrations is itself dependent on the knowledge of God.

Finally in the Sixth I distinguish the action of the understanding[7] from that of the imagination;[8] the marks by which this distinction is made are described. I here show that the mind of man is really distinct from the body, and at the same time that the two are so closely joined together that they form, so to speak, a single thing. All the errors which proceed from the senses are then surveyed, while the means of avoiding them are demonstrated, and finally all the reasons from which we may deduce the existence of material things are set forth. Not that I judge them to be very useful in establishing that which they prove, to wit, that there is in truth a world, that men possess bodies, and other such things which never have been doubted by anyone of sense; but because in considering these closely we come to see that they are neither so strong nor so evident as those arguments which lead us to the knowledge of our mind and of God; so that these last must be the most certain and most evident facts which can fall within the cognizance of the human mind. And this is the whole matter that I have tried to prove in these Meditations, for which reason I here omit to speak of many other questions which I dealt incidentally in this discussion.

Meditations On First Philosophy
in which the Existence of God and the Distinction Between Mind and Body are Demonstrated. [9]

>

Meditation I

Of the things which may be brought within the sphere of the doubtful

It is now some years since I detected how many were the false beliefs that I had from my earliest youth admitted as true, and how doubtful was everything I had since constructed on this basis; and from that time I was convinced that I must once for all seriously undertake to rid myself of all the opinions which I had formerly accepted, and commence to build anew from the foundation, if I wanted to establish any firm and permanent structure in the sciences. But as this enterprise appeared to be a very great one, I waited until I had attained an age so mature that I could not hope that at any later date I should be better fitted to execute my design. This reason caused me to delay so long that I should feel that I was doing wrong were I to occupy in deliberation the time that yet remains to me for action. To-day, then, since very opportunely for the plan I have in view I have delivered my mind from every care [and am happily agitated by no passions] and since I have procured for myself an assured leisure in a peaceable retirement, I shall at last seriously and freely address myself to the general upheaval of all my former opinions.

Now for this object it is not necessary that I should show that all of these are false -- I shall perhaps never arrive at this end. But inasmuch as reason already persuades me that I ought no less carefully to withhold my assent from matters which are not entirely certain and indubitable than from those which appear to me manifestly to be false, if I am able to find in each one some reason to doubt, this will suffice to justify my rejecting the whole. And for that end it will not be requisite that I should examine each in particular, which would be an endless undertaking; for owing to the fact that the destruction of the foundations of necessity brings with it the downfall of the rest of the edifice, I shall only in the first place attack those principles upon which all my former opinions rested.

All that up to the present time I have accepted as most true and certain I have learned either from the senses or through the senses; but it is sometimes proved to me that these senses are deceptive, and it is wiser not to trust entirely to anything by which we have once been deceived.

But it may be that although the senses sometimes deceive us concerning things which are hardly perceptible, or very far away, there are yet many others to be met with as to which we cannot reasonably have any doubt, although we recognise them by their means. For example, there is the fact that I am here, seated by the fire, attired in a dressing gown, having this paper in my hands and other similar matters. And how could I deny that these hands and this body are mine, were it not perhaps that I compare myself to certain persons, devoid of sense, whose cerebella are so troubled and clouded by the violent vapours of black bile, that they constantly assure us that they think they are kings when they are really quite poor, or that they are clothed in purple when they are really without covering, or who imagine that they have an earthenware head or are nothing but pumpkins or are made of glass. But they are mad, and I should not be any the less insane were I to follow examples so extravagant.

At the same time I must remember that I am a man, and that consequently I am in the habit of

sleeping, and in my dreams representing to myself the same things or sometimes even less probable things, than do those who are insane in their waking moments. How often has it happened to me that in the night I dreamt that I found myself in this particular place, that I was dressed and seated near the fire, whilst in reality I was lying undressed in bed! At this moment it does indeed seem to me that it is with eyes awake that I am looking at this paper; that this head which I move is not asleep, that it is deliberately and of set purpose that I extend my hand and perceive it; what happens in sleep does not appear so clear nor so distinct as does all this. But in thinking over this I remind myself that on many occasions I have in sleep been deceived by similar illusions, and in dwelling carefully on this reflection I see so manifestly that there are no certain indications by which we may clearly distinguish wakefulness from sleep that I am lost in astonishment. And my astonishment is such that it is almost capable of persuading me that I now dream.

Now let us assume that we are asleep and that all these particulars, e.g. that we open our eyes, shake our head, extend our hands, and so on, are but false delusions; and let us reflect that possibly neither our hands nor our whole body are such as they appear to us to be. At the same time we must at least confess that the things which are represented to us in sleep are like painted representations which can only have been formed as the counterparts of something real and true, and that in this way those general things at least, i.e. eyes, a head, hands, and a whole body, are not imaginary things, but things really existent. For, as a matter of fact, painters, even when they study with the greatest skill to represent sirens and satyrs by forms the most strange and extraordinary, cannot give them natures which are entirely new, but merely make a certain medley of the members of different animals; or if their imagination is extravagant enough to invent something so novel that nothing similar has ever before been seen, and that then their work represents a thing purely fictitious and absolutely false, it is certain all the same that the colours of which this is composed are necessarily real. And for the same reason, although these general things, to with, [a body], eyes, a head, hands, and such like, may be imaginary, we are bound at the same time to confess that there are at least some other objects yet more simple and more universal, which are real and true; and of these just in the same way as with certain real colours, all these images of things which dwell in our thoughts, whether true and real or false and fantastic, are formed.

To such a class of things pertains corporeal nature in general, and its extension, the figure of extended things, their quantity or magnitude and number, as also the place in which they are, the time which measures their duration, and so on.

That is possibly why our reasoning is not unjust when we conclude from this that Physics, Astronomy, Medicine and all other sciences which have as their end the consideration of composite things, are very dubious and uncertain; but that Arithmetic, Geometry and other sciences of that kind which only treat of things that are very simple and very general, without taking great trouble to ascertain whether they are actually existent or not, contain some measure of certainty and an element of the indubitable. For whether I am awake or asleep, two and three together always form five, and the square can never have more than four sides, and it does not seem possible that truths so clear and apparent can be suspected of any falsity [or uncertainty].

Nevertheless I have long had fixed in my mind the belief that an all-powerful God existed by whom I have been created such as I am. But how do I know that He has not brought it to pass that there is no earth, no heaven, no extended body, no magnitude, no place, and that nevertheless [I possess the perceptions of all these things and that] they seem to me to exist just exactly as I now see them? And, besides, as I sometimes imagine that others deceive themselves in the things which they think they know best, how do I know that I am not deceived every time that I add two and three, or

count the sides of a square, or judge of things yet simpler, if anything simpler can be imagined? But possibly God has not desired that I should be thus deceived, for He is said to be supremely good. If, however, it is contrary to His goodness to have made me such that I constantly deceive myself, it would also appear to be contrary to His goodness to permit me to be sometimes deceived, and nevertheless I cannot doubt that He does permit this.

There may indeed be those who would prefer to deny the existence of a God so powerful, rather than believe that all other things are uncertain. But let us not oppose them for the present, and grant that all that is here said of a God is a fable; nevertheless in whatever way they suppose that I have arrived at the state of being that I have reached -- whether they attribute it to fate or to accident, or make out that it is by a continual succession of antecedents, or by some other method -- since to err and deceive oneself is a defect, it is clear that the greater will be the probability of my being so imperfect as to deceive myself ever, as is the Author to whom they assign my origin the less powerful. To these reasons I have certainly nothing to reply, but at the end I feel constrained to confess that there is nothing in all that I formerly believed to be true, of which I cannot in some measure doubt, and that not merely through want of thought or through levity, but for reasons which are very powerful and maturely considered; so that henceforth I ought not the less carefully to refrain from giving credence to these opinions than to that which is manifestly false, if I desire to arrive at any certainty [in the sciences].

But it is not sufficient to have made these remarks, we must also be careful to keep them in mind. For these ancient and commonly held opinions still revert frequently to my mind, long and familiar custom having given them the right to occupy my mind against my inclination and rendered them almost masters of my belief; nor will I ever lose the habit of deferring to them or of placing my confidence in them, so long as I consider them as they really are, i.e. opinions in some measure doubtful, as I have just shown, and at the same time highly probable, so that there is much more reason to believe in than to deny them. That is why I consider that I shall not be acting amiss, if, taking of set purpose a contrary belief, I allow myself to be deceived, and for a certain time pretend that all these opinions are entirely false and imaginary, until at last, having thus balanced my former prejudices with my latter [so that they cannot divert my opinions more to one side than to the other], my judgment will no longer be dominated by bad usage or turned away from the right knowledge of the truth. For I am assured that there can be neither peril nor error in this course, and that I cannot at present yield too much to distrust, since I am not considering the question of action, but only of knowledge.

I shall then suppose, not that God who is supremely good and the fountain of truth, but some evil genius not less powerful than deceitful, has employed his whole energies in deceiving me; I shall consider that the heavens, the earth, colours, figures, sound, and all other external things are nought but the illusions and dreams of which this genius has availed himself in order to lay traps for my credulity; I shall consider myself as having no hands, no eyes, no flesh, no blood, nor any senses, yet falsely believing myself to possess all these things; I shall remain obstinately attached to this idea, and if by this means it is not in my power to arrive at the knowledge of any truth, I may at least do what is in my power [i.e. suspend my judgment], and with firm purpose avoid giving credence to any false thing, or being imposed upon by this arch deceiver, however powerful and deceptive he may be. But this task is a laborious one, and insensibly a certain lassitude leads me into the course of my ordinary life. And just as a captive who in sleep enjoys an imaginary liberty, when he begins to suspect that his liberty is but a dream, fears to awaken, and conspires with these agreeable illusions that the deception may be prolonged, so insensibly of my own accord I fall back

into my former opinions, and I dread awakening from this slumber, lest the laborious wakefulness which would follow the tranquillity of this repose should have to be spent not in daylight, but in the excessive darkness of the difficulties which have just been discussed.

Meditation II

Of the Nature of the Human Mind; and that it is more easily known than the Body

The Meditation of yesterday filled my mind with so many doubts that it is no longer in my power to forget them. And yet I do not see in what manner I can resolve them; and, just as if I had all of a sudden fallen into very deep water, I am so disconcerted that I can neither make certain of setting my feet on the bottom, nor can I swim and so support myself on the surface. I shall nevertheless make an effort and follow anew the same path as that on which I yesterday entered, i.e. I shall proceed by setting aside all that in which the least doubt could be supposed to exist, just as if I had discovered that it was absolutely false; and I shall ever follow in this road until I have met with something which is certain, or at least, if I can do nothing else, until I have learned for certain that there is nothing in the world that is certain. Archimedes, in order that he might draw the terrestrial globe out of its place, and transport it elsewhere, demanded only that one point should be fixed and immoveable; in the same way I shall have the right to conceive high hopes if I am happy enough to discover one thing only which is certain and indubitable.

I suppose, then, that all the things that I see are false; I persuade myself that nothing has ever existed of all that my fallacious memory represents to me. I consider that I possess no senses; I imagine that body, figure, extension, movement and place are but the fictions of my mind. What, then, can be esteemed as true? Perhaps nothing at all, unless that there is nothing in the world that is certain.

But how can I know there is not something different from those things that I have just considered, of which one cannot have the slightest doubt? Is there not some God, or some other being by whatever name we call it, who puts these reflections into my mind? That is not necessary, for is it not possible that I am capable of producing them myself? I myself, am I not at least something? But I have already denied that I had senses and body. Yet I hesitate, for what follows from that? Am I so dependent on body and senses that I cannot exist without these? But I was persuaded that there was nothing in all the world, that there was no heaven, no earth, that there were no minds, nor any bodies: was I not then likewise persuaded that I did not exist? Not at all; of a surety I myself did exist since I persuaded myself of something [or merely because I thought of something]. But there is some deceiver or other, very powerful and very cunning, who ever employs his ingenuity in deceiving me. Then without doubt I exist also if he deceives me, and let him deceive me as much as he will, he can never cause me to be nothing so long as I think that I am something. So that after having reflected well and carefully examined all things, we must come to the definite conclusion that this proposition: I am, I exist, is necessarily true each time that I pronounce it, or that I mentally conceive it.

But I do not yet know clearly enough what I am, I who am certain that I am; and hence I must be careful to see that I do not imprudently take some other object in place of myself, and thus that I

do not go astray in respect of this knowledge that I hold to be the most certain and most evident of all that I have formerly learned. That is why I shall now consider anew what I believed myself to be before I embarked upon these last reflections; and of my former opinions I shall withdraw all that might even in a small degree be invalidated by the reasons which I have just brought forward, in order that there may be nothing at all left beyond what is absolutely certain and indubitable.

What then did I formerly believe myself to be? Undoubtedly I believed myself to be a man. But what is a man? Shall I say a reasonable animal? Certainly not; for then I should have to inquire what an animal is, and what is reasonable; and thus from a single question I should insensibly fall into an infinitude of others more difficult; and I should not wish to waste the little time and leisure remaining to me in trying to unravel subtleties like these. But I shall rather stop here to consider the thoughts which of themselves spring up in my mind, and which were not inspired by anything beyond my own nature alone when I applied myself to the consideration of my being. In the first place, the, I considered myself as having a face, hands, arms, and all that system of members composed on bones and flesh as seen in a corpse which I designated by the name of body. In addition to this I considered that I was nourished, that I walked, that I felt, and that I thought, and I referred all these actions to the soul: but I did not stop to consider what the soul was, or if I did stop, I imagined that it was something extremely rare and subtle like a wind, a flame, or an ether, which was spread throughout my grosser parts. As to body I had no manner of doubt about its nature, but thought I had a very clear knowledge of it; and if I had desired to explain it according to the notions that I had then formed of it, I should have described it thus: By the body I understand all that which can be defined by a certain figure: something which can be confined in a certain place, and which can fill a given space in such a way that every other body will be excluded from it; which can be perceived either by tough, or by sight, or by hearing, or by taste, or by smell: which can be moved in many ways not, in truth, by itself, but by something which is foreign to it, by which it is touched [and from which it receives impressions]: for to have the power of self-movement, as also of feeling or of thinking, I did not consider to appertain to the nature of body: on the contrary, I was rather astonished to find that faculties similar to them existed in some bodies.

But what am I, now that I suppose that there is a certain genius which is extremely powerful, and, if I may say so, malicious, who employs all his powers in deceiving me? Can I affirm that I possess the least of all those things which I have just said pertain to the nature of body? I pause to consider, I revolve all these things in my mind, and I find none of which I can say that it pertains to me. It would be tedious to stop to enumerate them. Let us pass to the attributes of soul and see if there is any one which is in me? What of nutrition or walking [the first mentioned]? But if it is so that I have no body it is also true that I can neither walk nor take nourishment. Another attribute is sensation. But one cannot feel without body, and besides I have thought I perceived many things during sleep that I recognised in my waking moments as not having been experienced at all. What of thinking? I find here that thought is an attribute that belongs to me; it alone cannot be separated from me. I am, I exist, that is certain. But how often? Just when I think; for it might possibly be the case if I ceased entirely to think, that I should likewise cease altogether to exist. I do not now admit anything which is not necessarily true: to speak accurately I am not more than a thing which thinks, that is to say a mind or a soul, or an understanding, or a reason, which are terms whose significance was formerly unknown to me. I am, however, a real thing and really exist; but what thing? I have answered: a thing which thinks.

And what more? I shall exercise my imagination [in order to see if I am not something more]. I am

not a collection of members which we call the human body: I am not a subtle air distributed through these members, I am not a wind, a fire, a vapour, a breath, nor anything at all which I can imagine or conceive; because I have assumed that all these were nothing. Without changing that supposition I find that I only leave myself certain of the fact that I am somewhat. But perhaps it is true that these same things which I supposed were non-existent because they are unknown to me, are really not different from the self which I know. I am not sure about this, I shall not dispute about it now; I can only give judgment on things that are known to me. I know that I exist, and I inquire what I am, I whom I know to exist. But it is very certain that the knowledge of my existence taken in its precise significance does not depend on things whose existence is not yet known to me; consequently it does not depend on those which I can feign in imagination. And indeed the very term feign in imagination[10] proves to me my error, for I really do this if I image myself a something, since to imagine is nothing else than to contemplate the figure or image of a corporeal thing. But I already know for certain that I am, and that it may be that all these images, and, speaking generally, all things that relate to the nature of body are nothing but dreams [and chimeras]. For this reason I see clearly that I have as little reason to say, *I shall stimulate my imagination in order to know more distinctly what I am*, than if I were to say, *I am now awake, and I perceive somewhat that is real and true: but because I do not yet perceive it distinctly enough, I shall go to sleep of express purpose, so that my dreams may represent the perception with greatest truth and evidence.* And, thus, I know for certain that nothing of all that I can understand by means of my imagination belongs to this knowledge which I have of myself, and that it is necessary to recall the mind from this mode of thought with the utmost diligence in order that it may be able to know its own nature with perfect distinctness.

But what then am I? A thing which thinks. What is a thing which thinks? It is a thing which doubts, understands, [conceives], affirms, denies, wills, refuses, which also imagines and feels.

Certainly it is no small matter if all these things pertain to my nature. But why should they not so pertain? Am I not that being who now doubts nearly everything, who nevertheless understands certain things, who affirms that one only is true, who denies all the others, who desires to know more, is averse from being deceived, who imagines many things, sometimes indeed despite his will, and who perceives many likewise, as by the intervention of the bodily organs? Is there nothing in all this which is as true as it is certain that I exist, even though I should always sleep and though he who has given me being employed all his ingenuity in deceiving me? Is there likewise any one of these attributes which can be distinguished from my thought, or which might be said to be separated from myself? For it is so evident of itself that it is I who doubts, who understands, and who desires, that there is no reason here to add anything to explain it. And I have certainly the power of imagining likewise; for although it may happen (as I formerly supposed) that none of the things which I imagine are true, nevertheless this power of imagining does not cease to be really in use, and it forms part of my thought. Finally, I am the same who feels, that is to say, who perceives certain things, as by the organs of sense, since it truth I see light, I hear noise, I feel heat. But it will be said that these phenomena are false and that I am dreaming. Let it be so; still it is at least quite certain that it seems to me that I see light, that I hear noise and that I feel heat. That cannot be false; properly speaking it is what is in me called feeling;[11] and used in this precise sense that is no other thing than thinking.

From this time I begin to know what I am with a little more clearness and distinction than before; but nevertheless it still seems to me, and I cannot prevent myself from thinking, that corporeal things, whose images are framed by thought, which are tested by the senses, are much more

distinctly known than that obscure part of me which does not come under the imagination. Although really it is very strange to say that I know and understand more distinctly these things whose existence seems to me dubious, which are unknown to me, and which do not belong to me, than others of the truth of which I am convinced, which are known to me and which pertain to my real nature, in a word, than myself. But I see clearly how the case stands: my mind loves to wander, and cannot yet suffer itself to be retained within the just limits of truth. Very good, let us once more give it the freest rein, so that, when afterwards we seize the proper occasion for pulling up, it may the more easily be regulated and controlled.

Let us begin by considering the commonest matters, those which we believe to be the most distinctly comprehended, to wit, the bodies which we touch and see; not indeed bodies in general, for these general ideas are usually a little more confused, but let us consider one body in particular. Let us take, for example, this piece of wax: it has been taken quite freshly from the hive, and it has not yet lost the sweetness of the honey which it contains; it still retains somewhat of the odour of the flowers from which it has been culled; its colour, its figure, its size are apparent; it is hard, cold, easily handled, and if you strike it with the finger, it will emit a sound. Finally all the things which are requisite to cause us distinctly to recognise a body, are met with in it. But notice that while I speak and approach the fire what remained of the taste is exhaled, the smell evaporates, the colour alters, the figure is destroyed, the size increases, it becomes liquid, it heats, scarcely can one handle it, and when one strikes it, now sound is emitted. Does the same wax remain after this change? We must confess that it remains; none would judge otherwise. What then did I know so distinctly in this piece of wax? It could certainly be nothing of all that the senses brought to my notice, since all these things which fall under taste, smell, sight, touch, and hearing, are found to be changed, and yet the same wax remains.

Perhaps it was what I now think, viz. that this wax was not that sweetness of honey, nor that agreeable scent of flowers, nor that particular whiteness, nor that figure, nor that sound, but simply a body which a little while before appeared tome as perceptible under these forms, and which is now perceptible under others. But what, precisely, is it that I imagine when I form such conceptions? Let us attentively consider this, and, abstracting from all that does not belong to the wax, let us see what remains. Certainly nothing remains excepting a certain extended thing which is flexible and movable. But what is the meaning of flexible and movable? Is it not that I imagine that this piece of wax being round is capable of becoming square and of passing from a square to a triangular figure? No, certainly it is not that, since I imagine it admits of an infinitude of similar changes, and I nevertheless do not know how to compass the infinitude by my imagination, and consequently this conception which I have of the wax is not brought about by the faculty of imagination. What now is this extension? Is it not also unknown? For it becomes greater when the wax is melted, greater when it is boiled, and greater still when the heat increases; and I should not conceive [clearly] according to truth what wax is, if I did not think that even this piece that we are considering is capable of receiving more variations in extension than I have ever imagined. We must then grant that I could not even understand through the imagination what this piece of wax is, and that it is my mind[12] alone which perceives it. I say this piece of wax in particular, for as to wax in general it is yet clearer. But what is this piece of wax which cannot be understood excepting by the [understanding or] mind? It is certainly the same that I see, touch, imagine, and finally it is the same which I have always believed it to be from the beginning. But what must particularly be observed is that its perception is neither an act of vision, nor of touch, nor of imagination, and has never been such although it may have appeared formerly to be so, but only an intuition[13] of the

mind, which may be imperfect and confused as it was formerly, or clear and distinct as it is at present, according as my attention is more or less directed to the elements which are found in it, and of which it is composed.

Yet in the meantime I am greatly astonished when I consider [the great feebleness of mind] and its proneness to fall [insensibly] into error; for although without giving expression to my thought I consider all this in my own mind, words often impede me and I am almost deceived by the terms of ordinary language. For we say that we see the same wax, if it is present, and not that we simply judge that it is the same from its having the same colour and figure. From this I should conclude that I knew the wax by means of vision and not simply by the intuition of the mind; unless by chance I remember that, when looking from a window and saying I see men who pass in the street, I really do not see them, but infer that what I see is men, just as I say that I see wax. And yet what do I see from the window but hats and coats which may cover automatic machines? Yet I judge these to be men. And similarly solely by the faculty of judgment which rests in my mind, I comprehend that which I believed I saw with my eyes.

A man who makes it his aim to raise his knowledge above the common should be ashamed to derive the occasion for doubting from the forms of speech invented by the vulgar; I prefer to pass on and consider whether I had a more evident and perfect conception of what the wax was when I first perceived it, and when I believed I knew it by means of the external senses or at least by the common sense[14] as it is called, that is to say by the imaginative faculty, or whether my present conception is clearer now that I have most carefully examined what it is, and in what way it can be known. It would certainly be absurd to doubt as to this. For what was there in this first perception which was distinct? What was there which might not as well have been perceived by any of the animals? But when I distinguish the wax from its external forms, and when, just as if I had taken from it its vestments, I consider it quite naked, it is certain that although some error may still be found in my judgment, I can nevertheless not perceive it thus without a human mind.

But finally what shall I say of this mind, that is, of myself, for up to this point I do not admit in myself anything but mind? What then, I who seem to perceive this piece of wax so distinctly, do I not know myself, not only with much more truth and certainty, but also with much more distinctness and clearness? For if I judge that the wax is or exists from the fact that I see it, it certainly follows much more clearly that I am or that I exist myself from the fact that I see it. For it may be that what I see is not really wax, it may also be that I do not possess eyes with which to see anything; but it cannot be that when I see, or (for I no longer take account of the distinction) when I think I see, that I myself who think am nought. So if I judge that the wax exists from the fact that I touch it, the same thing will follow, to wit, that I am; and if I judge that my imagination, or some other cause, whatever it is, persuades me that the wax exists, I shall still conclude the same. And what I have here remarked of wax may be applied to all other things which are external to me [and which are met with outside of me]. And further, if the [notion or] perception of wax has seemed to me clearer and more distinct, not only after the sight or the touch, but also after many other causes have rendered it quite manifest to me, with how much more [evidence] and distinctness must it be said that I now know myself, since all the reasons which contribute to the knowledge of wax, or any other body whatever, are yet better proofs of the nature of my mind! And there are so many other things in the mind itself which may contribute to the elucidation of its nature, that those which depend on body such as these just mentioned, hardly merit being taken into account.

But finally here I am, having insensibly reverted to the point I desired, for, since it is now manifest

to me that even bodies are not properly speaking known by the senses or by the faculty of imagination, but by the understanding only, and since they are not known from the fact that they are seen or touched, but only because they are understood, I see clearly that there is nothing which is easier for me to know than my mind. But because it is difficult to rid oneself so promptly of an opinion to which one was accustomed for so long, it will be well that I should halt a little at this point, so that by the length of my meditation I may more deeply imprint on my memory this new knowledge.

Meditation III

Of God: that He exists

I shall now close my eyes, I shall stop my ears, I shall call away all my senses, I shall efface even from my thoughts all the images of corporeal things, or at least (for that is hardly possible) I shall esteem them as vain and false; and thus holding converse only with myself and considering my own nature, I shall try little by little to reach a better knowledge of and a more familiar acquaintanceship with myself. I am a thing that thinks, that is to say, that doubts, affirms, denies, that knows a few things, that is ignorant of many [that loves, that hates], that wills, that desires, that also imagines and perceives; for as I remarked before, although the things which I perceive and imagine are perhaps nothing at all apart from me and in themselves, I am nevertheless assured that these modes of thought that I call perceptions and imaginations, inasmuch only as they are modes of thought, certainly reside [and are met with] in me.

And in the little that I have just said, I think I have summed up all that I really know, or at least all that hitherto I was aware that I knew. In order to try to extend my knowledge further, I shall now look around more carefully and see whether I cannot still discover in myself some other things which I have not hitherto perceived. I am certain that I am a thing which thinks; but do I not then likewise know what is requisite to render me certain of a truth? Certainly in this first knowledge there is nothing that assures me of its truth, excepting the clear and distinct perception of that which I state, which would not indeed suffice to assure me that what I say is true, if it could ever happen that a thing which I conceived so clearly and distinctly could be false; and accordingly it seems to me that already I can establish as a general rule that all things which I perceive[15] very clearly and very distinctly are true.

At the same time I have before received and admitted many things to be very certain and manifest, which yet I afterwards recognised as being dubious. What then were these things? They were the earth, sky, stars and all other objects which I apprehended by means of the senses. But what did I clearly [and distinctly] perceive in them? Nothing more than that the ideas or thoughts of these things were presented to my mind. And not even now do I deny that these ideas are met with in me. But there was yet another thing which I affirmed, and which, owing to the habit which I had formed of believing it, I thought I perceived very clearly, although in truth I did not perceive it at all, to wit, that there were objects outside of me from which these ideas proceeded, and to which they were entirely similar. And it was in this that I erred, or, if perchance my judgment was correct, this was not due to any knowledge arising from my perception.

But when I took anything very simple and easy in the sphere of arithmetic or geometry into

consideration, e.g. that two and three together made five, and other things of the sort, were not these present to my mind so clearly as to enable me to affirm that they were true? Certainly if I judged that since such matters could be doubted, this would not have been so for any other reason than that it came into my mind that perhaps a God might have endowed me with such a nature that I may have been deceived even concerning things which seemed to me most manifest. But every time that this preconceived opinion of the sovereign power of a God presents itself to my thought, I am constrained to confess that it is easy to Him, if He wishes it, to cause me to err, even in matters in which I believe myself to have the best evidence. And, on the other hand, always when I direct my attention to things which I believe myself to perceive very clearly, I am so persuaded of their truth that I let myself break out into words such as these: Let who will deceive me, He can never cause me to be nothing while I think that I am, or some day cause it to be true to say that I have never been, it being true now to say that I am, or that two and three make more or less than five, or any such thing in which I see a manifest contradiction. And, certainly, since I have no reason to believe that there is a God who is a deceiver, and as I have not yet satisfied myself that there is a God at all, the reason for doubt which depends on this opinion alone is very slight, and so to speak metaphysical. But in order to be able altogether to remove it, I must inquire whether there is a God as soon as the occasion presents itself; and if I find that there is a God, I must also inquire whether He may be a deceiver; for without a knowledge of these two truths I do not see that I can ever be certain of anything.

And in order that I may have an opportunity of inquiring into this in an orderly way [without interrupting the order of meditation which I have proposed to myself, and which is little by little to pass from the notions which I find first of all in my mind to those which I shall later on discover in it] it is requisite that I should here divide my thoughts into certain kinds, and that I should consider in which of these kinds there is, properly speaking, truth or error to be found. Of my thoughts some are, so to speak, images of the things, and to these alone is the title *idea* properly applied; examples are my thought of a man or of a chimera, of heaven, of an angel, or [even] of God. But other thoughts possess other forms as well. For example in willing, fearing, approving, denying, though I always perceive something as the subject of the action of my mind,[16] yet by this action I always add something else to the idea[17] which I have of that thing; and of the thoughts of this kind some are called volitions or affections, and others judgments.

Now as to what concerns ideas, if we consider them only in themselves and do not relate them to anything else beyond themselves, they cannot properly speaking be false; for whether I imagine a goat or a chimera, it is not less true that I imagine the one that the other. We must not fear likewise that falsity can enter into will and into affections, for although I may desire evil things, or even things that never existed, it is not the less true that I desire them. Thus there remains no more than the judgments which we make, in which I must take the greatest care not o deceive myself. But the principal error and the commonest which we may meet with in them, consists in my judging that the ideas which are in me are similar or conformable to the things which are outside me; for without doubt if I considered the ideas only as certain modes of my thoughts, without trying to relate them to anything beyond, they could scarcely give me material for error.

But among these ideas, some appear to me to be innate, some adventitious, and others to be formed [or invented] by myself; for, as I have the power of understanding what is called a thing, or a truth, or a thought, it appears to me that I hold this power from no other source than my own nature. But if I now hear some sound, if I see the sun, or feel heat, I have hitherto judged that these sensations proceeded from certain things that exist outside of me; and finally it appears to me that sirens,

hippogryphs, and the like, are formed out of my own mind. But again I may possibly persuade myself that all these ideas are of the nature of those which I term adventitious, or else that they are all innate, or all fictitious: for I have not yet clearly discovered their true origin.

And my principal task in this place is to consider, in respect to those ideas which appear to me to proceed from certain objects that are outside me, what are the reasons which cause me to think them similar to these objects. It seems indeed in the first place that I am taught this lesson by nature; and, secondly, I experience in myself that these ideas do not depend on my will nor therefore on myself -- for they often present themselves to my mind in spite of my will. Just now, for instance, whether I will or whether I do not will, I feel heat, and thus I persuade myself that this feeling, or at least this idea of heat, is produced in me by something which is different from me, i.e. by the heat of the fire near which I sit. And nothing seems to me more obvious than to judge that this object imprints its likeness rather than anything else upon me.

Now I must discover whether these proofs are sufficiently strong and convincing. When I say that I am so instructed by nature, I merely mean a certain spontaneous inclination which impels me to believe in this connection, and not a natural light which makes me recognise that it is true. But these two things are very different; for I cannot doubt that which the natural light causes me to believe to be true, as, for example, it has shown me that I am from the fact that I doubt, or other facts of the same kind. And I possess no other faculty whereby to distinguish truth from falsehood, which can teach me that what this light shows me to be true is not really true, and no other faculty that is equally trustworthy. But as far as [apparently] natural impulses are concerned, I have frequently remarked, when I had to make active choice between virtue and vice, that they often enough led me to the part that was worse; and this is why I do not see any reason for following them in what regards truth and error.

And as to the other reason, which is that these ideas must proceed from objects outside me, since they do not depend on my will, I do not find it any the more convincing. For just as these impulses of which I have spoken are found in me, notwithstanding that they do not always concur with my will, so perhaps there is in me some faculty fitted to produce these ideas without the assistance of any external things, even though it is not yet known by me; just as, apparently, they have hitherto always been found in me during sleep without the aid of any external objects.

And finally, though they did proceed from objects different from myself, it is not a necessary consequence that they should resemble these. On the contrary, I have noticed that in many cases there was a great difference between the object and its idea. I find, for example, two completely diverse ideas of the sun in my mind; the one derives its origin from the senses, and should be placed in the category of adventitious ideas; according to this idea the sun seems to be extremely small; but the other is derived from astronomical reasonings, i.e. is elicited from certain notions that are innate in me, or else it is formed by me in some other manner; in accordance with it the sun appears to be several times greater than the earth. These two ideas cannot, indeed, both resemble the same sun, and reason makes me believe that the one which seems to have originated directly from the sun itself, is the one which is most dissimilar to it.

All this causes me to believe that until the present time it has not been by a judgment that was certain [or premeditated], but only by a sort of blind impulse that I believed that things existed outside of, and different from me, which, by the organs of my senses, or by some other method whatever it might be, conveyed these ideas or images to me [and imprinted on me their similitudes].

But there is yet another method of inquiring whether any of the objects of which I have ideas within me exist outside of me. If ideas are only taken as certain modes of thought, I recognise amongst them no difference or inequality, and all appear to proceed from me in the same manner; but when we consider them as images, one representing one thing and the other another, it is clear that they are very different one from the other. There is no doubt that those which represent to me substances are something more, and contain so to speak more objective reality within them [that is to say, by representation participate in a higher degree of being or perfection] than those that simply represent modes or accidents; and that idea again by which I understand a supreme God, eternal, infinite, [immutable], omniscient, omnipotent, and Creator of all things which are outside of Himself, has certainly more objective reality in itself than those ideas by which finite substances are represented.

Now it is manifest by the natural light that there must at least be as much reality in the efficient and total cause as in its effect. For, pray, whence can the effect derive its reality, if not from its cause? And in what way can this cause communicate this reality to it, unless it possessed it in itself? And from this it follows, not only that something cannot proceed from nothing, but likewise that what is more perfect -- that is to say, which has more reality within itself -- cannot proceed from the less perfect. And this is not only evidently true of those effects which possess actual or formal reality, but also of the ideas in which we consider merely what is termed objective reality. To take an example, the stone which has not yet existed not only cannot now commence to be unless it has been produced by something which possesses within itself, either formally or eminently, all that enters into the composition of the stone [i.e. it must possess the same things or other more excellent things than those which exist in the stone] and heat can only be produced in a subject in which it did not previously exist by a cause that is of an order [degree or kind] at least as perfect as heat, and so in all other cases. But further, the idea of heat, or of a stone, cannot exist in me unless it has been placed within me by some cause which possesses within it at least as much reality as that which I conceive to exist in the heat or the stone. For although this cause does not transmit anything of its actual or formal reality to my idea, we must not for that reason imagine that it is necessarily a less real cause; we must remember that [since every idea is a work of the mind] its nature is such that it demands of itself no other formal reality than that which it borrows from my thought, of which it is only a mode [i.e. a manner or way of thinking]. But in order that an idea should contain some one certain objective reality rather than another, it must without doubt derive it from some cause in which there is at least as much formal reality as this idea contains of objective reality. For if we imagine that something is found in an idea which is not found in the cause, it must then have been derived from nought; but however imperfect may be this mode of being by which a thing is objectively [or by representation] in the understanding by its idea, we cannot certainly say that this mode of being is nothing, nor consequently, that the idea derives its origin from nothing.

Nor must I imagine that, since the reality that I consider in these ideas is only objective, it is not essential that this reality should be formally in the causes of my ideas, but that it is sufficient that it should be found objectively. For just as this mode of objective existence pertains to ideas by their proper nature, so does the mode of formal existence pertain tot he causes of those ideas (this is at least true of the first and principal) by the nature peculiar to them. And although it may be the case that one idea gives birth to another idea, that cannot continue to be so indefinitely; for in the end we must reach an idea whose cause shall be so to speak an archetype, in which the whole reality [or perfection] which is so to speak objectively [or by representation] in these ideas is

contained formally [and really]. Thus the light of nature causes me to know clearly that the ideas in me are like [pictures or] images which can, in truth, easily fall short of the perfection of the objects from which they have been derived, but which can never contain anything greater or more perfect.

And the longer and the more carefully that I investigate these matters, the more clearly and distinctly do I recognise their truth. But what am I to conclude from it all in the end? It is this, that if the objective reality of any one of my ideas is of such a nature as clearly to make me recognise that it is not in me either formally or eminently, and that consequently I cannot myself be the cause of it, it follows of necessity that I am not alone in the world, but that there is another being which exists, or which is the cause of this idea. On the other hand, had no such an idea existed in me, I should have had no sufficient argument to convince me of the existence of any being beyond myself; for I have made very careful investigation everywhere and up to the present time have been able to find no other ground.

But of my ideas, beyond that which represents me to myself, as to which there can here be no difficulty, there is another which represents a God, and there are others representing corporeal and inanimate things, others angels, others animals, and others again which represent to me men similar to myself.

As regards the ideas which represent to me other men or animals, or angels, I can however easily conceive that they might be formed by an admixture of the other ideas which I have of myself, of corporeal things, and of God, even although there were apart from me neither men nor animals, nor angels, in all the world.

And in regard to the ideas of corporeal objects, I do not recognise in them anything so great or so excellent that they might not have possibly proceeded from myself; for if I consider them more closely, and examine them individually, as I yesterday examined the idea of wax, I find that there is very little in them which I perceive clearly and distinctly. Magnitude or extension in length, breadth, or depth, I do so perceive; also figure which results from a termination of this extension, the situation which bodies of different figure preserve in relation to one another, and movement or change of situation; to which we may also add substance, duration and number. As to other things such as light, colours, sounds, scents, tastes, heat, cold and the other tactile qualities, they are thought by me with so much obscurity and confusion that I do not even know if they are true or false, i.e. whether the ideas which I form of these qualities are actually the ideas of real objects or not [or whether they only represent chimeras which cannot exist in fact]. For although I have before remarked that it is only in judgments that falsity, properly speaking, or formal falsity, can be met with, a certain material falsity may nevertheless be found in ideas, i.e. when these ideas represent what is nothing as though it were something. For example, the ideas which I have of cold and heat are so far from clear and distinct that by their means I cannot tell whether cold is merely a privation of heat, or heat a privation of cold, or whether both are real qualities, or are not such. And inasmuch as [since ideas resemble images] there cannot be any ideas which do not appear to represent some things, if it is correct to say that cold is merely a privation of heat, the idea which represents it to me as something real and positive will not be improperly termed false, and the same holds good of other similar ideas.

To these it is certainly not necessary that I should attribute any author other than myself. For if they are false, i.e. if they represent things which do not exist, the light of nature shows me that they issue from nought, that is to say, that they are only in me so far as something is lacking to the perfection of my nature. But if they are true, nevertheless because they exhibit so little reality to

me that I cannot even clearly distinguish the thing represented from non-being, I do not see any reason why they should not be produced by myself.

As to the clear and distinct idea which I have of corporeal things, some of them seem as though I might have derived them from the idea which I possess of myself, as those which I have of substance, duration, number, and such like. For [even] when I think that a stone is a substance, or at least a thing capable of existing of itself, and that I am a substance also, although I conceive that I am a thing that thinks and not one that is extended, and that the stone on the other hand is an extended thing which does not think, and that thus there is a notable difference between the two conceptions -- they seem, nevertheless, to agree in this, that both represent substances. In the same way, when I perceive that I now exist and further recollect that I have in former times existed, and when I remember that I have various thoughts of which I can recognise the number, I acquire ideas of duration and number which I can afterwards transfer to any object that I please. But as to all the other qualities of which the ideas of corporeal things are composed, to wit, extension, figure, situation and motion, it is true that they are not formally in me, since I am only a thing that thinks; but because they are merely certain modes of substance [and so to speak the vestments under which corporeal substance appears to us] and because I myself am also a substance, it would seem that they might be contained in me eminently.

Hence there remains only the idea of God, concerning which we must consider whether it is something which cannot have proceeded from me myself. By the name God I understand a substance that is infinite [eternal, immutable], independent, all-knowing, all-powerful, and by which I myself and everything else, if anything else does exist, have been created. Now all these characteristics are such that the more diligently I attend to them, the less do they appear capable of proceeding from me alone; hence, from what has been already said, we must conclude that God necessarily exists.

For although the idea of substance is within me owing to the fact that I am substance, nevertheless I should not have the idea of an infinite substance -- since I am finite -- if it had not proceeded from some substance which was veritably infinite.

Nor should I imagine that I do not perceive the infinite by a true idea, but only by the negation of the finite, just as I perceive repose and darkness by the negation of movement and of light; for, on the contrary, I see that there is manifestly more reality in infinite substance than in finite, and therefore that in some way I have in me the notion of the infinite earlier then the finite -- to wit, the notion of God before that of myself. For how would it be possible that I should know that I doubt and desire, that is to say, that something is lacking to me, and that I am not quite perfect, unless I had within me some idea of a Being more perfect than myself, in comparison with which I should recognise the deficiencies of my nature?

And we cannot say that this idea of God is perhaps materially false and that consequently I can derive it from nought [i.e. that possibly it exists in me because I am imperfect], as I have just said is the case with ideas of heat, cold and other such things; for, on the contrary, as this idea is very clear and distinct and contains within it more objective reality than any other, there can be none which is of itself more true, nor any in which there can be less suspicion of falsehood. The idea, I say, of this Being who is absolutely perfect and infinite, is entirely true; for although, perhaps, we can imagine that such a Being does not exist, we cannot nevertheless imagine that His idea represents nothing real to me, as I have said of the idea of cold. This idea is also very clear and distinct; since all that I conceive clearly and distinctly of the real and the true, and of what conveys

some perfection, is in its entirety contained in this idea. And this does not cease to be true although I do not comprehend the infinite, or though in God there is an infinitude of things which I cannot comprehend, nor possibly even reach in any way by thought; for it is of the nature of the infinite that my nature, which is finite and limited, should not comprehend it; and it is sufficient that I should understand this, and that I should judge that all things which I clearly perceive and in which I know that there is some perfection, and possibly likewise an infinitude of properties of which I am ignorant, are in God formally or eminently, so that the idea which I have of Him may become the most true, most clear, and most distinct of all the ideas that are in my mind.

But possibly I am something more than I suppose myself to be, and perhaps all those perfections which I attribute to God are in some way potentially in me, although they do not yet disclose themselves, or issue in action. As a matter of fact I am already sensible that my knowledge increases [and perfects itself] little by little, and I see nothing which can prevent it from increasing more and more into infinitude; nor do I see, after it has thus been increased [or perfected], anything to prevent my being able to acquire by its means all the other perfections of the Divine nature; nor finally why the power I have of acquiring these perfections, if it really exists in me, shall not suffice to produce the ideas of them.

At the same time I recognise that this cannot be. For, in the first place, although it were true that every day my knowledge acquired new degrees of perfection, and that there were in my nature many things potentially which are not yet there actually, nevertheless these excellences do not pertain to [or make the smallest approach to] the idea which I have of God in whom there is nothing merely potential [but in whom all is present really and actually]; for it is an infallible token of imperfection in my knowledge that it increases little by little. and further, although my knowledge grows more and more, nevertheless I do not for that reason believe that it can ever be actually infinite, since it can never reach a point so high that it will be unable to attain to any greater increase. But I understand God to be actually infinite, so that He can add nothing to His supreme perfection. And finally I perceive that the objective being of an idea cannot be produced by a being that exists potentially only, which properly speaking is nothing, but only by a being which is formal or actual.

To speak the truth, I see nothing in all that I have just said which by the light of nature is not manifest to anyone who desires to think attentively on the subject; but when I slightly relax my attention, my mind, finding its vision somewhat obscured and so to speak blinded by the images of sensible objects, I do not easily recollect the reason why the idea that I possess of a being more perfect then I, must necessarily have been placed in me by a being which is really more perfect; and this is why I wish here to go on to inquire whether I, who have this idea, can exist if no such being exists.

And I ask, from whom do I then derive my existence? Perhaps from myself or from my parents, or from some other source less perfect than God; for we can imagine nothing more perfect than God, or even as perfect as He is.

But [were I independent of every other and] were I myself the author of my being, I should doubt nothing and I should desire nothing, and finally no perfection would be lacking to me; for I should have bestowed on myself every perfection of which I possessed any idea and should thus be God. And it must not be imagined that those things that are lacking to me are perhaps more difficult of attainment than those which I already possess; for, on the contrary, it is quite evident that it was a matter of much greater difficulty to bring to pass that I, that is to say, a thing or a substance that

thinks, should emerge out of nothing, than it would be to attain to the knowledge of many things of which I am ignorant, and which are only the accidents of this thinking substance. But it is clear that if I had of myself possessed this greater perfection of which I have just spoken [that is to say, if I had been the author of my own existence], I should not at least have denied myself the things which are the more easy to acquire [to wit, many branches of knowledge of which my nature is destitute]; nor should I have deprived myself of any of the things contained in the idea which I form of God, because there are none of them which seem to me specially difficult to acquire: and if there were any that were more difficult to acquire, they would certainly appear to me to be such (supposing I myself were the origin of the other things which I possess) since I should discover in them that my powers were limited.

But though I assume that perhaps I have always existed just as I am at present, neither can I escape the force of this reasoning, and imagine that the conclusion to be drawn from this is, that I need not seek for any author of my existence. For all the course of my life may be divided into an infinite number of parts, none of which is in any way dependent on the other; and thus from the fact that I was in existence a short time ago it does not follow that I must be in existence now, unless some cause at this instant, so to speak, produces me anew, that is to say, conserves me. It is as a matter of fact perfectly clear and evident to all those who consider with attention the nature of time, that, in order to be conserved in each moment in which it endures, a substance has need of the same power and action as would be necessary to produce and create it anew, supposing it did not yet exist, so that the light of nature shows us clearly that the distinction between creation and conservation is solely a distinction of the reason.

All that I thus require here is that I should interrogate myself, if I wish to know whether I possess a power which is capable of bringing it to pass that I who now am shall still be in the future; for since I am nothing but a thinking thing, or at least since thus far it is only this portion of myself which is precisely in question at present, if such a power did reside in me, I should certainly be conscious of it. But I am conscious of nothing of the kind, and by this I know clearly that I depend on some being different from myself.

Possibly, however, this being on which I depend is not that which I call God, and I am created either by my parents or by some other cause less perfect than God. This cannot be, because, as I have just said, it is perfectly evident that there must be at least as much reality in the cause as in the effect; and thus since I am a thinking thing, and possess an idea of God within me, whatever in the end be the cause assigned to my existence, it must be allowed that it is likewise a thinking thing and that it possesses in itself the idea of all the perfections which I attribute to God. We may again inquire whether this cause derives its origin from itself or from some other thing. For if from itself, it follows by the reasons before brought forward, that this cause must itself be God; for since it possesses the virtue of self-existence, it must also without doubt have the power of actually possessing all the perfections of which it has the idea, that is, all those which I conceive as existing in God. But if it derives its existence from some other cause than itself, we shall again ask, for the same reason, whether this second cause exists by itself or through another, until from one step to another, we finally arrive at an ultimate cause, which will be God.

And it is perfectly manifest that in this there can be no regression into infinity, since what is in question is not so much the cause which formerly created me, as that which conserves me at the present time.

Nor can we suppose that several causes may have concurred in my production, and that from one I

have received the idea of one of the perfections which I attribute to God, and from another the idea of some other, so that all these perfections indeed exist somewhere in the universe, but not as complete in one unity which is God. On the contrary, the unity, the simplicity or the inseparability of all things which are in god is one of the principal perfections which I conceive to be in Him. And certainly the idea of this unity of all Divine perfections cannot have been placed in me by any cause from which I have not likewise received the ideas of all the other perfections; for this cause could not make me able to comprehend them as joined together in an inseparable unity without having at the same time caused me in some measure to know what they are [and in some way to recognise each one of them].

Finally, so far as my parents [from whom it appears I have sprung] are concerned, although all that I have ever been able to believe of them were true, that does not make it follow that it is they who conserve me, nor are they even the authors of my being in any sense, in so far as I am a thinking being; since what they did was merely to implant certain dispositions in that matter in which the self -- i.e. the mind, which alone I at present identify with myself -- is by me deemed to exist. And thus there can be no difficulty in their regard, but we must of necessity conclude from the fact alone that I exist, or that the idea of a Being supremely perfect -- that is of God -- is in me, that the proof of God's existence is grounded on the highest evidence.

It only remains to me to examine into the manner in which I have acquired this idea from God; for I have not received it through the senses, and it is never presented to me unexpectedly, as is usual with the ideas of sensible things when these things present themselves, or seem to present themselves, to the external organs of my senses; nor is it likewise a fiction of my mind, for it is not in my power to take from or to add anything to it; and consequently the only alternative is that it is innate in me, just as the idea of myself is innate in me.

And one certainly ought not to find it strange that God, in creating me, placed this idea within me to be like the mark of the workman imprinted on his work; and it is likewise not essential that the mark shall be something different from the work itself. For from the sole fact that God created me it is most probable that in some way he has placed his image and similitude upon me, and that I perceive this similitude (in which the idea of God is contained) by means of the same faculty by which I perceive myself -- that is to say, when I reflect on myself I not only know that I am something [imperfect], incomplete and dependent on another, which incessantly aspires after something which is better and greater than myself, but I also know that He on whom I depend possesses in Himself all the great things towards which I aspire [and the ideas of which I find within myself], and that not indefinitely or potentially alone, but really, actually and infinitely; and that thus He is God. And the whole strength of the argument which I have here made use of to prove the existence of God consists in this, that I recognise that it is not possible that my nature should be what it is, and indeed that I should have in myself the idea of a God, if God did not veritably exist -- a God, I say, whose idea is in me, i.e. who possesses all those supreme perfections of which our mind may indeed have some idea but without understanding them all, who is liable to no errors or defect [and who has none of all those marks which denote imperfection]. From this it is manifest that He cannot be a deceiver, since the light of nature teaches us that fraud and deception necessarily proceed from some defect.

But before I examine this matter with more care, and pass on to the consideration of other truths which may be derived from it, it seems to me right to pause for a while in order to contemplate God Himself, to ponder at leisure His marvellous attributes, to consider, and admire, and adore, the beauty of this light so resplendent, at least as far as the strength of my mind, which is in some

measure dazzled by the sight, will allow me to do so. For just as faith teaches us that the supreme felicity of the other life consists only in this contemplation of the Divine Majesty, so we continue to learn by experience that a similar meditation, though incomparably less perfect, causes us to enjoy the greatest satisfaction of which we are capable in this life.

Meditation IV

Of the True and the False

I have been well accustomed these past days to detach my mind from my senses, and I have accurately observed that there are very few things that one knows with certainty respecting corporeal objects, that there are many more which are known to us respecting the human mind, and yet more still regarding God Himself; so that I shall now without any difficulty abstract my thoughts from the consideration of [sensible or] imaginable objects, and carry them to those which, being withdrawn from all contact with matter, are purely intelligible. And certainly the idea which I possess of the human mind inasmuch as it is a thinking thing, and not extended in length, width and depth, nor participating in anything pertaining to body, is incomparably more distinct than is the idea of any corporeal thing. And when I consider that I doubt, that is to say, that I am an incomplete and dependent being, the idea of a being that is complete and independent, that is of God, presents itself to my mind with so much distinctness and clearness -- and from the fact alone that this idea is found in me, or that I who possess this idea exist, I conclude so certainly that God exists, and that my existence depends entirely on Him in every moment of my life -- that I do not think that the human mind is capable of knowing anything with more evidence and certitude. And it seems to me that I now have before me a road which will lead us from the contemplation of the true God (in whom all the treasures of science and wisdom are contained) to the knowledge of the other objects of the universe.

For, first of all, I recognise it to be impossible that He should ever deceive me; for in all fraud and deception some imperfection is to be found, and although it may appear that the power of deception is a mark of subtilty or power, yet the desire to deceive without doubt testifies to malice or feebleness, and accordingly cannot be found in God.

In the next place I experienced in myself a certain capacity for judging which I have doubtless received from God, like all the other things that I possess; and as He could not desire to deceive me, it is clear that He has not given me a faculty that will lead me to err if I use it aright.

And no doubt respecting this matter could remain, if it were not that the consequence would seem to follow that I can thus never be deceived; for if I hold all that I possess from God, and if He has not placed in me the capacity for error, it seems as though I could never fall into error. And it is true that when I think only of God [and direct my mind wholly to Him],[18] I discover [in myself] no cause of error, or falsity; yet directly afterwards, when recurring to myself, experience shows me that I am nevertheless subject to an infinitude of errors, as to which, when we come to investigate them more closely, I notice that not only is there a real and positive idea of God or of a Being of supreme perfection present to my mind, but also, so to speak, a certain negative idea of nothing, that is, of that which is infinitely removed from any kind of perfection; and that I am in a sense something intermediate between God and nought, i.e. placed in such a manner between the

supreme Being and non-being, that there is in truth nothing in me that can lead to error in so far as a sovereign Being has formed me; but that, as I in some degree participate likewise in nought or in non-being, i.e. in so far as I am not myself the supreme Being, and as I find myself subject to an infinitude of imperfections, I ought not to be astonished if I should fall into error. Thus do I recognise that error, in so far as it is such, is not a real thing depending on God, but simply a defect; and therefore, in order to fall into it, that I have no need to possess a special faculty given me by God for this very purpose, but that I fall into error from the fact that the power given me by God for the purpose of distinguishing truth from error is not infinite.

Nevertheless this does not quite satisfy me; for error is not a pure negation [i.e. is not the dimple defect or want of some perfection which ought not to be mine], but it is a lack of some knowledge which it seems that I ought to possess. And on considering the nature of God it does not appear to me possible that He should have given me a faculty which is not perfect of its kind, that is, which is wanting in some perfection due to it. For if it is true that the more skilful the artizan, the more perfect is the work of his hands, what can have been produced by this supreme Creator of all things that is not in all its parts perfect? And certainly there is no doubt that God could have created me so that I could never have been subject to error; it is also certain that He ever wills what is best; is it then better that I should be subject to err than that I should not?

In considering this more attentively, it occurs to me in the first place that I should not be astonished if my intelligence is not capable of comprehending why God acts as He does; and that there is thus no reason to doubt of His existence from the fact that I may perhaps find many other things besides this as to which I am able to understand neither for what reason nor how God has produced them. For, in the first place, knowing that my nature is extremely feeble and limited, and that the nature of God is on the contrary immense, incomprehensible, and infinite, I have no further difficulty in recognising that there is an infinitude of matter in His power, the causes of which transcend my knowledge; and this reason suffices to convince me that the species of cause termed final, finds no useful employment in physical [or natural] things; for it does not appear to me that I can without temerity seek to investigate the [inscrutable] ends of God.

It further occurs to me that we should not consider one single creature separately, when we inquire as to whether the works of God are perfect, but should regard all his creations together. For the same thing which might possibly seem very imperfect with some semblance of reason if regarded by itself, is found to be very perfect if regarded as part of the whole universe; and although, since I resolved to doubt all things, I as yet have only known certainly my own existence and that of God, nevertheless since I have recognised the infinite power of God, I cannot deny that He may have produced many other things, or at least that He has the power of producing them, so that I may obtain a place as a part of a great universe.

Whereupon, regarding myself more closely, and considering what are my errors (for they alone testify to there being any imperfection in me), I answer that they depend on a combination of two causes, to wit, on the faculty of knowledge that rests in me, and on the power of choice or of free will -- that is to say, of the understanding and at the same time of the will. For by the understanding alone I [neither assert nor deny anything, but] apprehend[19] the ideas of things as to which I can form a judgment. But no error is properly speaking found in it, provided the word error is taken in its proper signification; and though there is possibly an infinitude of things in the world of which I have no idea in my understanding, we cannot for all that say that it is deprived of these ideas [as we might say of something which is required by its nature], but simply it does not

possess these; because in truth there is no reason to prove that God should have given me a greater faculty of knowledge than He has given me; and however skillful a workman I represent Him to be, I should not for all that consider that He was bound to have placed in each of His works all the perfections which He may have been able to place in some. I likewise cannot complain that God has not given me a free choice or a will which is sufficient, ample and perfect, since as a matter of fact I am conscious of a will so extended as to be subject to no limits. And what seems to me very remarkable in this regard is that of all the qualities which I possess there is no one so perfect and so comprehensive that I do not very clearly recognise that it might be yet greater and more perfect. For, to take an example, if I consider the faculty of comprehension which I possess, I find that it is of very small extent and extremely limited, and at the same time I find the idea of another faculty much more ample and even infinite, and seeing that I can form the idea of it, I recognise from this very fact that it pertains to the nature of God. If in the same way I examine the memory, the imagination, or some other faculty, I do not find any which is not small and circumscribed, while in God it is immense [or infinite]. It is free-will alone or liberty of choice which I find to be so great in me that I can conceive no other idea to be more great; it is indeed the case that it is for the most part this will that causes me to know that in some manner I bear the image and similitude of God. For although the power of will is incomparably greater in God than in me, both by reason of the knowledge and the power which, conjoined with it, render it stronger and more efficacious, and by reason of its object, inasmuch as in God it extends to a great many things; it nevertheless does not seem to me greater if I consider it formally and precisely in itself: for the faculty of will consists alone in our having the power of choosing to do a thing or choosing not to do it (that is, to affirm or deny, to pursue or to shun it), or rather it consists alone in the fact that in order to affirm or deny, pursue or shun those things placed before us by the understanding, we act so that we are unconscious that any outside force constrains us in doing so. For in order that I should be free it is not necessary that I should be indifferent as to the choice of one or the other of two contraries; but contrariwise the more I lean to the one -- whether I recognise clearly that the reasons of the good and true are to be found in it, or whether God so disposes my inward thought -- the more freely do I choose and embrace it. And undoubtedly both divine grace and natural knowledge, far from diminishing my liberty, rather increase it and strengthen it. Hence this indifference which I feel, when I am not swayed to one side rather than to the other by lack of reason, is the lowest grade of liberty, and rather evinces a lack or negation in knowledge than a perfection of will: for if I always recognised clearly what was true and good, I should never have trouble in deliberating as to what judgment or choice I should make, and then I should be entirely free without ever being indifferent.

From all this I recognise that the power of will which I have received from God is not of itself the source of my errors -- for it is very ample and very perfect of its kind -- any more than is the power of understanding; for since I understand nothing but by the power which God has given me for understanding, there is no doubt that all that I understand, I understand as I ought, and it is not possible that I err in this. Whence then come my errors? They come from the sole fact that since the will is much wider in its range and compass than the understanding, I do not restrain it within the same bounds, but extend it also to things which I do not understand: and as the will is of itself indifferent to these, it easily falls into error and sin, and chooses the evil for the good, or the false for the true.

For example, when I lately examined whether anything existed in the world, and found that from the very fact that I considered this question it followed very clearly that I myself existed, I could

not prevent myself from believing that a thing I so clearly conceived was true: not that I found myself compelled to do so by some external cause, but simply because from great clearness in my mind there followed a great inclination of my will; and I believed this with so much the greater freedom or spontaneity as I possessed the less indifference towards it. Now, on the contrary, I not only know that I exist, inasmuch as I am a thinking thing, but a certain representation of corporeal nature is also presented to my mind; and it comes to pass that I doubt whether this thinking nature which is in me, or rather by which I am what I am, differs from this corporeal nature, or whether both are not simply the same thing; and I here suppose that I do not yet know any reason to persuade me to adopt the one belief rather than the other. From this it follows that I am entirely indifferent as to which of the two I affirm or deny, or even whether I abstain from forming any judgment in the matter.

And this indifference does not only extend to matters as to which the understanding has no knowledge, but also in general to all those which are not apprehended with perfect clearness at the moment when the will is deliberating upon them: for, however probable are the conjectures which render me disposed to form a judgment respecting anything, the simple knowledge that I have that those are conjectures alone and not certain and indubitable reasons, suffices to occasion me to judge the contrary. Of this I have had great experience of late when I set aside as false all that I had formerly held to be absolutely true, for the sole reason that I remarked that it might in some measure be doubted.

But if I abstain from giving my judgment on any thing when I do not perceive it with sufficient clearness and distinctness, it is plain that I act rightly and am not deceived. But if I determine to deny or affirm, I no longer make use as I should of my free will, and if I affirm what is not true, it is evident that I deceive myself; even though I judge according to truth, this comes about only by chance, and I do not escape the blame of misusing my freedom; for the light of nature teaches us that the knowledge of the understanding should always precede the determination of the will. And it is in the misuse of the free will that the privation which constitutes the characteristic nature of error is met with. Privation, I say, is found in the act, in so far as it proceeds from me, but it is not found in the faculty which I have received from God, nor even in the act in so far as it depends on Him.

For I have certainly no cause to complain that God has not given me an intelligence which is more powerful, or a natural light which is stronger than that which I have received from Him, since it is proper to the finite understanding not to comprehend a multitude of things, and it is proper to a created understanding to be finite; on the contrary, I have every reason to render thanks to God who owes me nothing and who has given me all the perfections I possess, and I should be far from charging Him with injustice, and with having deprived me of, or wrongfully withheld from me, these perfections which He has not bestowed upon me.

I have further no reason to complain that He has given me a will more ample than my understanding, for since the will consists only of one single element, and is so to speak indivisible, it appears that its nature is such that nothing can be abstracted from it [without destroying it]; and certainly the more comprehensive it is found to be, the more reason I have to render gratitude to the giver.

And, finally, I must also not complain that God concurs with me in forming the acts of the will, that is the judgment in which I go astray, because these acts are entirely true and good, inasmuch as they depend on God; and in a certain sense more perfection accrues to my nature from the fact

that I can form them, than if I could not do so. As to the privation in which alone the formal reason of error or sin consists, it has no need of any concurrence from God, since it is not a thing [or an existence], and since it is not related to God as to a cause, but should be termed merely a negation [according to the significance given to these words in the Schools]. For in fact it is not an imperfection in God that He has given me the liberty to give or withhold my assent from certain things as to which He has not placed a clear and distinct knowledge in my understanding; but it is without doubt an imperfection in me not to make a good use of my freedom, and to give my judgment readily on matters which I only understand obscurely. I nevertheless perceive that God could easily have created me so that I never should err, although I still remained free, and endowed with a limited knowledge, viz. by giving to my understanding a clear and distinct intelligence of all things as to which I should ever have to deliberate; or simply by His engraving deeply in my memory the resolution never to form a judgment on anything without having a clear and distinct understanding of it, so that I could never forget it. And it is easy for me to understand that, in so far as I consider myself alone, and as if there were only myself in the world, I should have been much more perfect than I am, if God had created me so that I could never err. Nevertheless I cannot deny that in some sense it is a greater perfection in the whole universe that certain parts should not be exempt from error as others are than that all parts should be exactly similar. And I have no right to complain if God, having placed me in the world, has not called upon me to play a part that excels all others in distinction and perfection.

And further I have reason to be glad on the ground that if He has not given me the power of never going astray by the first means pointed out above, which depends on a clear and evident knowledge of all the things regarding which I can deliberate, He has at least left within my power the other means, which is firmly to adhere to the resolution never to give judgment on matters whose truth is not clearly known to me; for although I notice a certain weakness in my nature in that I cannot continually concentrate my mind on one single thought, I can yet, by attentive and frequently repeated meditation, impress it so forcibly on my memory that I shall never fail to recollect it whenever I have need of it, and thus acquire the habit of never going astray.

And inasmuch as it is in this that the greatest and principal perfection of man consists, it seems to me that I have not gained little by this day's Meditation, since I have discovered the source of falsity and error. And certainly there can be no other source than that which I have explained; for as often as I so restrain my will within the limits of my knowledge that it forms no judgment except on matters which are clearly and distinctly represented to it by the understanding, I can never be deceived; for every clear and distinct conception[20] is without doubt something, and hence cannot derive its origin from what is nought, but must of necessity have God as its author -- God, I say, who being supremely perfect, cannot be the cause of any error; and consequently we must conclude that such a conception [or such a judgment] is true. Nor have I only learned to-day what I should avoid in order that I may not err, but also how I should act in order to arrive at a knowledge of the truth; for without doubt I shall arrive at this end if I devote my attention sufficiently to those things which I perfectly understand; and if I separate from these that which I only understand confusedly and with obscurity. To these I shall henceforth diligently give heed.

Meditation V

Of the essence of material things, and, again, of God, that He exists

Many other matters respecting the attributes of God and my own nature or mind remain for consideration; but I shall possibly on another occasion resume the investigation of these. Now (after first noting what must be done or avoided, in order to arrive at a knowledge of the truth) my principal task is to endeavour to emerge from the state of doubt into which I have these last days fallen, and to see whether nothing certain can be known regarding material things.

But before examining whether any such objects as I conceive exist outside of me, I must consider the ideas of them in so far as they are in my thought, and see which of them are distinct and which confused.

In the first place, I am able distinctly to imagine that quantity which philosophers commonly call continuous, or the extension in length, breadth, or depth, that is in this quantity, or rather in the object to which it is attributed. Further, I can number in it many different parts, and attribute to each of its parts many sorts of size, figure, situation and local movement, and, finally, I can assign to each of these movements all degrees of duration.

And not only do I know these things with distinctness when I consider them in general, but, likewise [however little I apply my attention to the matter], I discover an infinitude of particulars respecting numbers, figures, movements, and other such things, whose truth is so manifest, and so well accords with my nature, that when I begin to discover them, it seems to me that I learn nothing new, or recollect what I formerly knew -- that is to say, that I for the first time perceive things which were already present to my mind, although I had not as yet applied my mind to them.

And what I here find to be most important is that I discover in myself an infinitude of ideas of certain things which cannot be esteemed as pure negations, although they may possibly have no existence outside of my thought, and which are not framed by me, although it is within my power either to think or not to think them, but which possess natures which are true and immutable. For example, when I imagine a triangle, although there may nowhere in the world be such a figure outside my thought, or ever have been, there is nevertheless in this figure a certain determinate nature, form, or essence, which is immutable and eternal, which I have not invented, and which in no wise depends on my mind, as appears from the fact that diverse properties of that triangle can be demonstrated, viz. that its three angles are equal to two right angles, that the greatest side is subtended by the greatest angle, and the like, which now, whether I wish it or do not wish it, I recognise very clearly as pertaining to it, although I never thought of the matter at all when I imagined a triangle for the first time, and which therefore cannot be said to have been invented by me.

Nor does the objection hold good that possibly this idea of a triangle has reached my mind through the medium of my senses, since I have sometimes seen bodies triangular in shape; because I can form in my mind an infinitude of other figures regarding which we cannot have the least conception of their ever having been objects of sense, and I can nevertheless demonstrate various properties pertaining to their nature as well as to that of the triangle, and these must certainly all be true since I conceive them clearly. Hence they are something, and not pure negation; for it is perfectly clear that all that is true is something, and I have already fully demonstrated that all that I know clearly is true. And even although I had not demonstrated this, the nature of my mind is such that I could not prevent myself from holding them to be true so long as I conceive them clearly; and I recollect that even when I was still strongly attached to the objects of sense, I counted as the most certain those truths which I conceived clearly as regards figures, numbers, and the other matters which pertain to arithmetic and geometry, and, in general, to pure and abstract

mathematics.

But now, if just because I can draw the idea of something from my thought, it follows that all which I know clearly and distinctly as pertaining to this object does really belong to it, may I not derive from this an argument demonstrating the existence of God? It is certain that I no less find the idea of God, that is to say, the idea of a supremely perfect Being, in me, than that of any figure or number whatever it is; and I do not know any less clearly and distinctly that an [actual and] eternal existence pertains to this nature than I know that all that which I am able to demonstrate of some figure or number truly pertains to the nature of this figure or number, and therefore, although all that I concluded in the preceding Meditations were found to be false, the existence of God would pass with me as at least as certain as I have ever held the truths of mathematics (which concern only numbers and figures) to be.

This indeed is not at first manifest, since it would seem to present some appearance of being a sophism. For being accustomed in all other things to make a distinction between existence and essence, I easily persuade myself that the existence can be separated from the essence of God, and that we can thus conceive God as not actually existing. But, nevertheless, when I think of it with more attention, I clearly see that existence can no more be separated from the essence of God than can its having its three angles equal to two right angles be separated from the essence of a [rectilinear] triangle, or the idea of a mountain from the idea of a valley; and so there is not any less repugnance to our conceiving a God (that is, a Being supremely perfect) to whom existence is lacking (that is to say, to whom a certain perfection is lacking), than to conceive of a mountain which has no valley.

But although I cannot really conceive of a God without existence any more than a mountain without a valley, still from the fact that I conceive of a mountain with a valley, it does not follow that there is such a mountain in the world; similarly although I conceive of God as possessing existence, it would seem that it does not follow that there is a God which exists; for my thought does not impose any necessity upon things, and just as I may imagine a winged horse, although no horse with wings exists, so I could perhaps attribute existence to God, although no God existed.

But a sophism is concealed in this objection; for from the fact that I cannot conceive a mountain without a valley, it does not follow that there is any mountain or any valley in existence, but only that the mountain and the valley, whether they exist or do not exist, cannot in any way be separated one from the other. While from the fact that I cannot conceive God without existence, it follows that existence is inseparable from Him, and hence that He really exists; not that my thought can bring this to pass, or impose any necessity on things, but, on the contrary, because the necessity which lies in the thing itself, i.e. the necessity of the existence of God determines me to think in this way. For it is not within my power to think of God without existence (that is of a supremely perfect Being devoid of a supreme perfection) though it is in my power to imagine a horse either with wings or without wings.

And we must not here object that it is in truth necessary for me to assert that God exists after having presupposed that He possesses every sort of perfection, since existence is one of these, but that as a matter of fact my original supposition was not necessary, just as it is not necessary to consider that all quadrilateral figures can be inscribed in the circle; for supposing I thought this, I should be constrained to admit that the rhombus might be inscribed in the circle since it is a quadrilateral figure, which, however, is manifestly false. [We must not, I say, make any such allegations because] although it is not necessary that I should at any time entertain the notion of

God, nevertheless whenever it happens that I think of a first and a sovereign Being, and, so to speak, derive the idea of Him from the storehouse of my mind, it is necessary that I should attribute to Him every sort of perfection, although I do not get so far as to enumerate them all, or to apply my mind to each one in particular. And this necessity suffices to make me conclude (after having recognised that existence is a perfection) that this first and sovereign Being really exists; just as though it is not necessary for me ever to imagine any triangle, yet, whenever I wish to consider a rectilinear figure composed only of three angles, it is absolutely essential that I should attribute to it all those properties which serve to bring about the conclusion that its three angles are not greater than two right angles, even although I may not then be considering this point in particular. But when I consider which figures are capable of being inscribed in the circle, it is in no wise necessary that I should think that all quadrilateral figures are of this number; on the contrary, I cannot even pretend that this is the case, so long as I do not desire to accept anything which I cannot conceive clearly and distinctly. And in consequence there is a great difference between the false suppositions such as this, and the true ideas born within me, the first and principal of which is that of God. For really I discern in many ways that this idea is not something factitious, and depending solely on my thought, but that it is the image of a true and immutable nature; first of all, because I cannot conceive anything but God himself to whose essence existence [necessarily] pertains; in the second place because it is not possible for me to conceive two or more Gods in this same position; and, granted that there is one such God who now exists, I see clearly that it is necessary that He should have existed from all eternity, and that He must exist eternally; and finally, because I know an infinitude of other properties in God, none of which I can either diminish or change.

For the rest, whatever proof or argument I avail myself of, we must always return to the point that it is only those things which we conceive clearly and distinctly that have the power of persuading me entirely. And although amongst the matters which I conceive of in this way, some indeed are manifestly obvious to all, while others only manifest themselves to those who consider them closely and examine them attentively; still, after they have once been discovered, the latter are not esteemed as any less certain than the former. For example, in the case of every right-angled triangle, although it does not so manifestly appear that the square of the base is equal to the squares of the two other sides as that this base is opposite to the greatest angle; still, when this has once been apprehended, we are just as certain of its truth as of the truth of the other. And as regards God, if my mind were not pre-occupied with prejudices, and if my thought did not find itself on all hands diverted by the continual pressure of sensible things, there would be nothing which I could know more immediately and more easily than Him. For is there anything more manifest than that there is a God, that is to say, a Supreme Being, to whose essence alone existence pertains?[21]

And although for a firm grasp of this truth I have need of a strenuous application of mind, at present I not only feel myself to be as assured of it as of all that I hold as most certain, but I also remark that the certainty of all other things depends on it so absolutely, that without this knowledge it is impossible ever to know anything perfectly.

For although I am of such a nature that as long as[22] I understand anything very clearly and distinctly, I am naturally impelled to believe it to be true, yet because I am also of such a nature that I cannot have my mind constantly fixed on the same object in order to perceive it clearly, and as I often recollect having formed a past judgment without at the same time properly recollecting the reasons that led me to make it, it may happen meanwhile that other reasons present themselves

to me, which would easily cause me to change my opinion, if I were ignorant of the facts of the existence of God, and thus I should have no true and certain knowledge, but only vague and vacillating opinions. Thus, for example, when I consider the nature of a [rectilinear] triangle, I who have some little knowledge of the principles of geometry recognise quite clearly that the three angles are equal to two right angles, and it is not possible for me not to believe this so long as I apply my mind to its demonstration; but so soon as I abstain from attending to the proof, although I still recollect having clearly comprehended it, it may easily occur that I come to doubt its truth, if I am ignorant of there being a God. For I can persuade myself of having been so constituted by nature that I can easily deceive myself even in those matters which I believe myself to apprehend with the greatest evidence and certainty, especially when I recollect that I have frequently judged matters to be true and certain which other reasons have afterwards impelled me to judge to be altogether false.

But after I have recognised that there is a God -- because at the same time I have also recognised that all things depend upon Him, and that He is not a deceiver, and from that have inferred that what I perceive clearly and distinctly cannot fail to be true -- although I no longer pay attention to the reasons for which I have judged this to be true, provided that I recollect having clearly and distinctly perceived it no contrary reason can be brought forward which could ever cause me to doubt of its truth; and thus I have a true and certain knowledge of it. And this same knowledge extends likewise to all other things which I recollect having formerly demonstrated, such as the truths of geometry and the like; for what can be alleged against them to cause me to place them in doubt? Will it be said that my nature is such as to cause me to be frequently deceived? But I already know that I cannot be deceived in the judgment whose grounds I know clearly. Will it be said that I formerly held many things to be true and certain which I have afterwards recognised to be false? But I had not had any clear and distinct knowledge of these things, and not as yet knowing the rule whereby I assure myself of the truth, I had been impelled to give my assent from reasons which I have since recognised to be less strong than I had at the time imagined them to be. What further objection can then be raised? That possibly I am dreaming (an objection I myself made a little while ago), or that all the thoughts which I now have are no more true than the phantasies of my dreams? But even though I slept the case would be the same, for all that is clearly present to my mind is absolutely true.

And so I very clearly recognise that the certainty and truth of all knowledge depends alone on the knowledge of the true God, in so much that, before I knew Him, I could not have a perfect knowledge of any other thing. And now that I know Him I have the means of acquiring a perfect knowledge of an infinitude of things, not only of those which relate to God Himself and other intellectual matters, but also of those which pertain to corporeal nature in so far as it is the object of pure mathematics [which have no concern with whether it exists or not].

Meditation VI

Of the Existence of Material Things, and of the real distinction between the Soul and Body of Man

Nothing further now remains but to inquire whether material things exist. And certainly I at least

know that these may exist in so far as they are considered as the objects of pure mathematics, since in this aspect I perceive them clearly and distinctly. For there is no doubt that God possesses the power to produce everything that I am capable of perceiving with distinctness, and I have never deemed that anything was impossible for Him, unless I found a contradiction in attempting to conceive it clearly. Further, the faculty of imagination which I possess, and of which, experience tells me, I make use when I apply myself to the consideration of material things, is capable of persuading me of their existence; for when I attentively consider what imagination is, I find that it is nothing but a certain application of the faculty of knowledge to the body which is immediately present to it, and which therefore exists.

And to render this quite clear, I remark in the first place the difference that exists between the imagination and pure intellection [or conception[23]]. For example, when I imagine a triangle, I do not conceive it only as a figure comprehended by three lines, but I also apprehend[24] these three lines as present by the power and inward vision of my mind,[25] and this is what I call imagining. But if I desire to think of a chiliagon, I certainly conceive truly that it is a figure composed of a thousand sides, just as easily as I conceive of a triangle that it is a figure of three sides only; but I cannot in any way imagine the thousand sides of a chiliagon [as I do the three sides of a triangle], nor do I, so to speak, regard them as present [with the eyes of my mind]. And although in accordance with the habit I have formed of always employing the aid of my imagination when I think of corporeal things, it may happen that in imagining a chiliagon I confusedly represent to myself some figure, yet it is very evident that this figure is not a chiliagon, since it in no way differs from that which I represent to myself when I think of a myriagon or any other many-sided figure; nor does it serve my purpose in discovering the properties which go to form the distinction between a chiliagon and other polygons. But if the question turns upon a pentagon, it is quite true that I can conceive its figure as well as that of a chiliagon without the help of my imagination; but I can also imagine it by applying the attention of my mind to each of its five sides, and at the same time to the space which they enclose. And thus I clearly recognise that I have need of a particular effort of mind in order to effect the act of imagination, such as I do not require in order to understand, and this particular effort of mind clearly manifests the difference which exists between imagination and pure intellection.[26]

I remark besides that this power of imagination which is in one, inasmuch as it differs from the power of understanding, is in no wise a necessary element in my nature, or in [my essence, that is to say, in] the essence of my mind; for although I did not possess it I should doubtless ever remain the same as I now am, from which it appears that we might conclude that it depends on something which differs from me. And I easily conceive that if some body exists with which my mind is conjoined and united in such a way that it can apply itself to consider it when it pleases, it may be that by this means it can imagine corporeal objects; so that this mode of thinking differs from pure intellection only inasmuch as mind in its intellectual activity in some manner turns on itself, and considers some of the ideas which it possesses in itself; while in imagining it turns towards the body, and there beholds in it something conformable to the idea which it has either conceived of itself or perceived by the senses. I easily understand, I say, that the imagination could be thus constituted if it is true that body exists; and because I can discover no other convenient mode of explaining it, I conjecture with probability that body does exist; but this is only with probability, and although I examine all things with care, I nevertheless do not find that from this distinct idea of corporeal nature, which I have in my imagination, I can derive any argument from which there will necessarily be deduced the existence of body.

But I am in the habit of imagining many other things besides this corporeal nature which is the object of pure mathematics, to wit, the colours, sounds, scents, pain, and other such things, although less distinctly. And inasmuch as I perceive these things much better through the senses, by the medium of which, and by the memory, they seem to have reached my imagination, I believe that, in order to examine them more conveniently, it is right that I should at the same time investigate the nature of sense perception, and that I should see if from the ideas which I apprehend by this mode of thought, which I call feeling, I cannot derive some certain proof of the existence of corporeal objects.

And first of all I shall recall to my memory those matters which I hitherto held to be true, as having perceived them through the senses, and the foundations on which my belief has rested; in the next place I shall examine the reasons which have since obliged me to place them in doubt; in the last place I shall consider which of them I must now believe.

First of all, then, I perceived that I had a head, hands, feet, and all other members of which this body -- which I considered as a part, or possibly even as the whole, of myself -- is composed. Further I was sensible that this body was placed amidst many others, from which it was capable of being affected in many different ways, beneficial and hurtful, and I remarked that a certain feeling of pleasure accompanied those that were beneficial, and pain those which were harmful. And in addition to this pleasure and pain, I also experienced hunger, thirst, and other similar appetites, as also certain corporeal inclinations towards joy, sadness, anger, and other similar passions. And outside myself, in addition to extension, figure, and motions of bodies, I remarked in them hardness, heat, and all other tactice qualities, and, further, light and colour, and scents and sounds, the variety of which gave me the means of distinguishing the sky, the earth, the sea, and generally all the other bodies, one from the other. And certainly, considering the ideas of all these qualities which presented themselves to my mind, and which alone I perceived properly or immediately, it was not without reason that I believed myself to perceive objects quite different from my thought, to wit, bodies from which those ideas proceeded; for I found by experience that these ideas presented themselves to me without my consent being requisite, so that I could not perceive any object, however desirous I might be, unless it were present to the organs of sense; and it was not in my power not to perceive it, when it was present. And because the ideas which I received through the senses were much more lively, more clear, and even, in their own way, more distinct than any of those which I could of myself frame in meditation, or than those I found impressed on my memory, it appeared as though they could not have proceeded from my mind, so that they must necessarily have been produced in me by some other things. And having no knowledge of those objects excepting the knowledge which the ideas themselves gave me, nothing was more likely to occur to my mind than that the objects were similar to the ideas which were caused. And because I likewise remembered that I had formerly made use of my senses rather than my reason, and recognised that the ideas which I formed of myself were not so distinct as those which I perceived through the senses, and that they were most frequently even composed of portions of these last, I persuaded myself easily that I had no idea in my mind which had not formerly come to me through the senses. Nor was it without some reason that I believed that this body (which be a certain special right I call my own) belonged to me more properly and more strictly than any other; for in fact I could never be separated from it as from other bodies; I experienced in it and on account of it all my appetites and affections, and finally I was touched by the feeling of pain and the titillation of pleasure in its parts, and not in the parts of other bodies which were separated from it. But when I inquired, why, from some, I know not what, painful sensation, there follows sadness of mind, and

from the pleasurable sensation there arises joy, or why this mysterious pinching of the stomach which I call hunger causes me to desire to eat, and dryness of throat causes a desire to drink, and so on, I could give no reason excepting that nature taught me so; for there is certainly no affinity (that I at least can understand) between the craving of the stomach and the desire to eat, any more than between the perception of whatever causes pain and the thought of sadness which arises from this perception. And in the same way it appeared to me that I had learned from nature all the other judgments which I formed regarding the objects of my senses, since I remarked that these judgments were formed in me before I had the leisure to weigh and consider any reasons which might oblige me to make them.

But afterwards many experiences little by little destroyed all the faith which I had rested in my senses; for I from time to time observed that those towers which from afar appeared to me to be round, more closely observed seemed square, and that colossal statues raised on the summit of these towers, appeared as quite tiny statues when viewed from the bottom; and so in an infinitude of other cases I found error in judgments founded on the external senses. And not only in those founded on the external senses, but even in those founded on the internal as well; for is there anything more intimate or more internal than pain? And yet I have learned from some persons whose arms or legs have been cut off, that they sometimes seemed to feel pain in the part which had been amputated, which made me think that I could not be quite certain that it was a certain member which pained me, even although I felt pain in it. And to those grounds of doubt I have lately added two others, which are very general; the first is that I never have believed myself to feel anything in waking moments which I cannot also sometimes believe myself to feel when I sleep, and as I do not think that these things which I seem to feel in sleep, proceed from objects outside of me, I do not see any reason why I should have this belief regarding objects which I seem to perceive while awake. The other was that being still ignorant, or rather supposing myself to be ignorant, of the author of my being, I saw nothing to prevent me from having been so constituted by nature that I might be deceived even in matters which seemed to me to be most certain. And as to the grounds on which I was formerly persuaded of the truth of sensible objects, I had not much trouble in replying to them. For since nature seemed to cause me to lean towards many things from which reason repelled me, I did not believe that I should trust much to the teachings of nature. And although the ideas which I receive by the senses do not depend on my will, I did not think that one should for that reason conclude that they proceeded from things different from myself, since possibly some faculty might be discovered in me -- though hitherto unknown to me -- which produced them.

But now that I begin to know myself better, and to discover more clearly the author of my being, I do not in truth think that I should rashly admit all the matters which the senses seem to teach us, but, on the other hand, I do not think that I should doubt them all universally.

And first of all, because I know that all things which I apprehend clearly and distinctly can be created by God as I apprehend them, it suffices that I am able to apprehend one thing apart from another clearly and distinctly in order to be certain that the one is different from the other, since they may be made to exist in separation at least by the omnipotence of God; and it does not signify by what power this separation is made in order to compel me to judge them to be different: and, therefore, just because I know certainly that I exist, and that meanwhile I do not remark that any other thing necessarily pertains to my nature or essence, excepting that I am a thinking thing, I rightly conclude that my essence consists solely in the fact that I am a thinking thin [or a substance whose whole essence or nature is to think]. And although possibly (or rather certainly, as I shall

say in a moment) I possess a body with which I am very intimately conjoined, yet because, on the one side, I have a clear and distinct idea of myself inasmuch as I am only a thinking and unextended thing, and as, on the other, I possess a distinct idea of body, inasmuch as it is only an extended and unthinking thing, it is certain that this I [that is to say, my soul by which I am what I am], is entirely and absolutely distinct from my body, and can exist without it.

I further find in myself faculties imploying modes of thinking peculiar to themselves, to wit, the faculties of imagination and feeling, without which I can easily conceive myself clearly and distinctly as a complete being; while, on the other hand, they cannot be so conceived apart from me, that is without an intelligent substance in which they reside, for [in the notion we have of these faculties, or, to use the language of the Schools] in their formal concept, some kind of intellection is comprised, from which I infer that they are distinct from me as its modes are from a thing. I observe also in me some other faculties such as that of change of position, the assumption of different figures and such like, which cannot be conceived, any more than can the preceding, apart from some substance to which they are attached, and consequently cannot exist without it; but it is very clear that these faculties, if it be true that they exist, must be attached to some corporeal or extended substance, and not to an intelligent substance, since in the clear and distinct conception of these there is some sort of extension found to be present, but no intellection at all. There is certainly further in me a certain passive faculty of perception, that is, of receiving and recognising the ideas of sensible things, but this would be useless to me [and I could in no way avail myself of it], if there were not either in me or in some other thing another active faculty capable of forming and producing these ideas. But this active faculty cannot exist in me [inasmuch as I am a thing that thinks] seeing that it does not presuppose thought, and also that those ideas are often produced in me without my contributing in any way to the same, and often even against my will; it is thus necessarily the case that the faculty resides in some substance different from me in which all the reality which is objectively in the ideas that are produced by this faculty is formally or eminently contained, as I remarked before. And this substance is either a body, that is, a corporeal nature in which there is contained formally [and really] all that which is objectively [and by representation] in those ideas, or it is God Himself, or some other creature more noble than body in which that same is contained eminently. But, since God is no deceiver, it is very manifest that He does not communicate to me these ideas immediately and by Himself, nor yet by the intervention of some creature in which their reality is not formally, but only eminently, contained. For since He has given me no faculty to recognise that this is the case, but, on the other hand, a very great inclination to believe [that they are sent to me or] that they are conveyed to me by corporeal objects, I do not see how He could be defended from the accusation of deceit if these ideas were produced by causes other than corporeal objects. Hence we must allow that corporeal things exist. However, they are perhaps not exactly what we perceive by the senses, since this comprehension by the senses is in many instances very obscure and confused; but we must at least admit that all things which I conceive in them clearly and distinctly, that is to say, all things which, speaking generally, are comprehended in the object of pure mathematics, are truly to be recognised as external objects.

As to other things, however, which are either particular only, as, for example, that the sun is of such and such a figure, etc., or which are less clearly and distinctly conceived, such as light, sound, pain and the like, it is certain that although they are very dubious and uncertain, yet on the sole ground that God is not a deceiver, and that consequently He has not permitted any falsity to exist in my opinion which He has not likewise given me the faculty of correcting, I may assuredly hope

to conclude that I have within me the means of arriving at the truth even here. And first of all there is no doubt that in all things which nature teaches me there is some truth contained; for by nature, considered in general, I now understand no other thing than either God Himself or else the order and disposition which God has established in created things; and by my nature in particular I understand no other thing than the complexus of all the things which God has given me.

But there is nothing which this nature teaches me more expressly [nor more sensibly] than that I have a body which is adversely affected when I feel pain, which has need of food or drink when I experience the feelings of hunger and thirst, and so on; nor can I doubt there being some truth in all this.

Nature also teaches me by these sensations of pain, hunger, thirst, etc., that I am not only lodged in my body as a pilot in a vessel, but that I am not only lodged in my body as a pilot in a vessel, but that I am very closely united to it, and so to speak so intermingled with it that I seem to compose with it one whole. For if that were not the case, when my body is hurt, I, who am merely a thinking thing, should not feel pain, for I should perceive this wound by the understanding only, just as the sailor perceives by sight when something is damaged in his vessel; and when my body has need of drink or food, I should clearly understand the fact without being warned of it by confused feelings of hunger and thirst. For all these sensations of hunger, thirst, pain, etc. are in truth none other than certain confused modes of thought which are produced by the union and apparent intermingling of mind and body.

Moreover, nature teaches me that many other bodies exist around mine, of which some are to be avoided, and others sought after. And certainly from the fact that I am sensible of different sorts of colours, sounds, scents, tastes, heat, hardness, etc., I very easily conclude that there are in the bodies from which all these diverse sense-perceptions proceed certain variations which answer to them, although possibly these are not really at all similar to them. And also from the fact that amongst these different sense-perceptions some are very agreeable to me and others disagreeable, it is quite certain that my body (or rather myself in my entirety, inasmuch as I am formed of body and soul) may receive different impressions agreeable and disagreeable from the other bodies which surround it.

But there are many other things which nature seems to have taught me, but which at the same time I have never really received from her, but which have been brought about in my mind by a certain habit which I have of forming inconsiderate judgments on things; and thus it may easily happen that these judgments contain some error. Take, for example, the opinion which I hold that all space in which there is nothing that affects [or makes an impression on] my senses is void; that in a body which is warm there is something entirely similar to the idea of heat which is in me; that in a white or green body there is the same whiteness or greenness that I perceive; that in a bitter or sweet body there is the same taste, and so on in other instances; that the stars, the towers, and all other distant bodies are of the same figure and size as they appear from far off to our eyes, etc. But in order that in this there should be nothing which I do not conceive distinctly, I should define exactly what I really understand when I say that I am taught somewhat by nature. For here I take nature in a more limited signification than when I term it the sum of all the things given me by God, since in this sum many things are comprehended which only pertain to mind (and to these I do not refer in speaking of nature) such as the notion which I have of the fact that what has once been done cannot ever be undone and an infinitude of such things which I know by the light of nature [without the help of the body]; and seeing that it comprehends many other matters besides which only pertain to body, and are no longer here contained under the name of nature, such as the

quality of weight which it possesses and the like, with which I also do not deal; for in talking of nature I only treat of those things given by God to me as a being composed of mind and body. But the nature here described truly teaches me to flee from things which cause the sensation of pain, and seek after the things which communicate to me the sentiment of pleasure and so forth; but I do not see that beyond this it teaches me that from those diverse sense-perceptions we should ever form any conclusion regarding things outside of us, without having [carefully and maturely] mentally examined them beforehand. For it seems to me that it is mind alone, and not mind and body in conjunction, that is requisite to a knowledge of the truth in regard to such things. Thus, although a star makes no larger an impression on my eye than the flame of a little candle there is yet in me no real or positive propensity impelling me to believe that it is not greater than that flame; but I have judged it to be so from my earliest years, without any rational foundation. And although in approaching fire I feel heat, and in approaching it a little too near I even feel pain, there is at the same time no reason in this which could persuade me that there is in the fire something resembling this heat any more than there is in it something resembling the pain; all that I have any reason to believe from this is, that there is something in it, whatever it may be, which excites in me these sensations of heat or of pain. So also, although there are spaces in which I find nothing which excites my senses, I must not from that conclude that these spaces contain no body; for I see in this, as in other similar things, that I have been in the habit of perverting the order of nature, because these perceptions of sense having bee placed within me by nature merely for the purpose of signifying to my mind what things are beneficial or hurtful to the composite whole of which it forms a part, and being up to that point sufficiently clear and distinct, I yet avail myself of them as though they were absolute rules by which I might immediately determine the essence of the bodies which are outside me, as to which, in fact, they can teach me nothing but what is most obscure and confused.

But I have already sufficiently considered how, notwithstanding the supreme goodness of God, falsity enters into the judgments I make. Only here a new difficulty is presented -- one respecting those things the pursuit or avoidance of which is taught me by nature, and also respecting the internal sensations which I possess, and in which I seem to have sometimes detected error [and thus to be directly deceived by my own nature]. To take an example, the agreeable taste of some food in which poison has been intermingled may induce me to partake of the poison, and thus deceive me. It is true, at the same time, that in this case nature may be excused, for it only induces me to desire food in which I find a pleasant taste, and not to desire the poison which is unknown to it; and thus I can infer nothing from this fact, except that my nature is not omniscient, at which there is certainly no reason to be astonished, since man, being finite in nature, can only have knowledge the perfectness of which is limited.

But we not unfrequently deceive ourselves even in those things to which we are directly impelled by nature, as happens with those who when they are sick desire to drink or eat things hurtful to them. It will perhaps be said here that the cause of their deceptiveness is that their nature is corrupt, but that does not remove the difficulty, because a sick man is none the less truly God's creature than he who is in health; and it is therefore as repugnant to God's goodness for the one to have a deceitful nature as it is for the other. And as a clock composed of wheels and counter-weights no less exactly observes the laws of nature when it is badly made, and does not show the time properly, than when it entirely satisfies the wishes of its maker, and as, if I consider the body of a man as being a sort of machine so built up and composed of nerves, muscles, veins, blood and skin, that though there were no mind in it at all, it would not cease to have the same motions as at present, exception being

made of those movements which are due to the direction of the will, and in consequence depend upon the mind [as apposed to those which operate by the disposition of its organs], I easily recognise that it would be as natural to this body, supposing it to be, for example, dropsical, to suffer the parchedness of the throat which usually signifies to the mind the feeling of thirst, and to be disposed by this parched feeling to move the nerves and other parts in the way requisite for drinking, and thus to augment its malady and do harm to itself, as it is natural to it, when it has no indisposition, to be impelled to drink for its good by a similar cause. And although, considering the use to which the clock has been destined by its maker, I may say that it deflects from the order of its nature when it does not indicate the hours correctly; and as, in the same way, considering the machine of the human body as having been formed by God in order to have in itself all the movements usually manifested there, I have reason for thinking that it does not follow the order of nature when, if the throat is dry, drinking does harm to the conservation of health, nevertheless I recognise at the same time that this last mode of explaining nature is very different from the other. For this is but a purely verbal characterisation depending entirely on my thought, which compares a sick man and a badly constructed clock with the idea which I have of a healthy man and a well made clock, and it is hence extrinsic to the things to which it is applied; but according to the other interpretation of the term nature I understand something which is truly found in things and which is therefore not without some truth.

But certainly although in regard to the dropsical body it is only so to speak to apply an extrinsic term when we say that its nature is corrupted, inasmuch as apart from the need to drink, the throat is parched; yet in regard to the composite whole, that is to say, to the mind or soul united to this body, it is not a purely verbal predicate, but a real error of nature, for it to have thirst when drinking would be hurtful to it. And thus it still remains to inquire how the goodness of God does not prevent the nature of man so regarded from being fallacious.

In order to begin this examination, then, I here say, in the first place, that there is a great difference between mind and body, inasmuch as body is by nature always divisible, and the mind is entirely indivisible. For, as a matter of fact, when I consider the mind, that is to say, myself inasmuch as I am only a thinking thing, I cannot distinguish in myself any parts, but apprehend myself to be clearly one and entire; and although the whole mind seems to be united to the whole body, yet if a foot, or an arm, or some other part, is separated from my body, I am aware that nothing has been taken away from my mind. And the faculties of willing, feeling, conceiving, etc. cannot be properly speaking said to be its parts, for it is one and the same mind which employs itself in willing and in feeling and understanding. But it is quite otherwise with corporeal or extended objects, for there is not one of these imaginable by me which my mind cannot easily divide into parts, and which consequently I do not recognise as being divisible; this would be sufficient to teach me that the mind or soul of man is entirely different from the body, if I had not already learned it from other sources.

I further notice that the mind does not receive the impressions from all parts of the body immediately, but only from the brain, or perhaps even from one of its smallest parts, to wit, from that in which the common sense[27] is said to reside, which, whenever it is disposed in the same particular way, conveys the same thing to the mind, although meanwhile the other portions of the body may be differently disposed, as is testified by innumerable experiments which it is unnecessary here to recount.

I notice, also, that the nature of body is such that none of its parts can be moved by another part a

little way off which cannot also be moved in the same way by each one of the parts which are between the two, although this more remote part does not act at all. As, for example, in the cord ABCD [which is in tension] if we pull the last part D, the first part A will not be moved in any way differently from what would be the case if one of the intervening parts B or C were pulled, and the last part D were to remain unmoved. And in the same way, when I feel pain in my foot, my knowledge of physics teaches me that this sensation is communicated by means of nerves dispersed through the foot, which, being extended like cords from there to the brain, when they are contracted in the foot, at the same time contract the inmost portions of the brain which is their extremity and place of origin, and then excite a certain movement which nature has established in order to cause the mind to be affected by a sensation of pain represented as existing in the foot. But because these nerves must pass through the tibia, the thigh, the loins, the back and the neck, in order to reach from the leg to the brain, it may happen that although their extremities which are in the foot are not affected, but only certain ones of their intervening parts [which pass by the loins or the neck], this action will excite the same movement in the brain that might have been excited there by a hurt received in the foot, in consequence of which the mind will necessarily feel in the foot the same pain as if it had received a hurt. And the same holds good of all the other perceptions of our senses.

I notice finally that since each of the movements which are in the portion of the brain by which the mind is immediately affected brings about one particular sensation only, we cannot under the circumstances imagine anything more likely than that this movement, amongst all the sensations which it is capable of impressing on it, causes mind to be affected by that one which is best fitted and most generally useful for the conservation of the human body when it is in health. But experience makes us aware that all the feelings with which nature inspires us are such as I have just spoken of; and there is therefore nothing in them which does not give testimony to the power and goodness of the God [who has produced them[28]]. Thus, for example, when the nerves which are in the feet are violently or more than usually moved, their movement, passing through the medulla of the spine[29] to the inmost parts of the brain, gives a sign to the mind which makes it feel somewhat, to wit, pain, as though in the foot, by which the mind is excited to do its utmost to remove the cause of the evil as dangerous and hurtful to the foot. It is true that God could have constituted the nature of man in such a way that this same movement in the brain would have conveyed something quite different to the mind; for example, it might have produced consciousness of itself either in so far as it is in the brain, or as it is in the foot, or as it is in some other place between the foot and the brain, or it might finally have produced consciousness of anything else whatsoever; but none of all this would have contributed so well to the conservation of the body. Similarly, when we desire to drink, a certain dryness of the throat is produced which moves its nerves, and by their means the internal portions of the brain; and this movement causes in the mind the sensation of thirst, because in this case there is nothing more useful to us than to become aware that we have need to drink for the conservation o our health; and the same holds good in other instances.

From this it is quite clear that, notwithstanding the supreme goodness of God, the nature of man, inasmuch as it is composed of mind and body, cannot be otherwise than sometimes a source of deception. For if there is any cause which excites, not in the foot but in some part of the nerves which are extended between the foot and the brain, or even in the brain itself, the same movement which usually is produced when the foot is detrimentally affected, pain will be experienced as though it were in the foot, and the sense will thus naturally be deceived; for since the same

movement in the brain is capable of causing but one sensation in the mind, and this sensation is much more frequently excited by a cause which hurts the foot than by another existing in some other quarter, it is reasonable that it should convey to the mind pain in the foot rather than in any other part of the body. And although the parchedness of the throat does not always proceed, as it usually does, from the fact that drinking is necessary for the health of the body, but sometimes comes from quite a different cause, as is the case with dropsical patients, it is yet much better that it should mislead on this occasion than if, on the other hand, it were always to deceive us when the body is in good health; and so on in similar cases.

And certainly this consideration is of great service to me, not only in enabling me to recognise all the errors to which my nature is subject, but also in enabling me to avoid them or to correct them more easily. for knowing that all my senses more frequently indicate to me truth than falsehood respecting the things which concern that which is beneficial to the body, and being able almost always to avail myself of many of them in order to examine one particular thing, and, besides that, being able to make use of my memory in order to connect the present with the past, and of my understanding which already has discovered all the causes of my errors, I ought no longer to fear that falsity may be found in matters every day presented to me by my senses. And I ought to set aside all the doubts of these past days as hyperbolical and ridiculous, particularly that very common uncertainty respecting sleep, which I could not distinguish from the waking state; for at present I find a very notable difference between the two, inasmuch as our memory can never connect our dreams one with the other, or with the whole course of our lives, as it unites events which happen to us while we are awake. And, as a matter of fact, if someone, while I was awake, quite suddenly appeared to me and disappeared as fast as do the images which I see in sleep, so that I could not know from whence the form came nor whither it went, it would not be without reason that I should deem it a spectre or a phantom formed by my brain [and similar to those which I form in sleep], rather than a real man. But when I perceive things as to which I know distinctly both the place from which they proceed, and that in which they are, and the time at which they appeared to me; and when, without any interruption, I can connect the perceptions which I have of them with the whole course of my life, I am perfectly assured that these perceptions occur while I am waking and not during sleep. And I ought in no wise to doubt the truth of such matters, if, after having called up all my senses, my memory, and my understanding, to examine them, nothing is brought to evidence by any one of them which is repugnant to what is set forth by the others. For because God is in no wise a deceiver, it follows that I am not deceived in this. But because the exigencies of action often oblige us to make up our minds before having leisure to examine matters carefully, we must confess that the life of man is very frequently subject to error in respect to individual objects, and we must in the end acknowledge the infirmity of our nature.

Notes

[2] For convenience sake the *Objections and Replies* are published in the second volume of this edition.

[3] The French version is followed here.

[4] The French version is followed here.

[5] When it is thought desirable to insert additional readings from the French version this will be indicated by the use of square brackets.

[6] Between the Praefatio ad Lectorem and the Synopsis, the Paris Edition (1st Edition) interpolates an Index which is not found in the Amsterdam Edition (2nd Edition). Since Descartes did not reproduce it, he was doubtless not its author. Mersenne probably composed it himself, adjusting it to the paging of the first Edition. (Note in Adam and Tannery's Edition.)

[7] intellectio.

[8] imaginatio.

[9] In place of this long title at the head of the page the first Edition had immediately after the Synopsis, and on the same page 7, simply *First Meditation.* (Adam's Edition.)

[10] Or *form an image* (effingo).

[11] Sentire.

Meditations on First Philosophy

Rene Descartes

1641

 This file is of the 1911 edition of The Philosophical Works of Descartes (Cambridge University Press), translated by Elizabeth S. Haldane.1

Prefatory Note To The Meditations.

The first edition of the Meditations was published in Latin by Michael Soly of Paris "at the Sign of the Phoenix" in 1641 cum Privilegio et Approbatione Doctorum. The Royal "privilege" was indeed given, but the "approbation" seems to have been of a most indefinite kind. The reason of the book being published in France and not in Holland, where Descartes was living in a charming country house at Endegeest near Leiden, was apparently his fear that the Dutch ministers might in some way lay hold of it. His friend, Pere Mersenne, took charge of its publication in Paris and wrote to him about any difficulties that occurred in the course of its progress through the press. The second edition was however published at Amsterdam in 1642 by Louis Elzevir, and this edition was accompanied by the now completed "Objections and Replies."2 The edition from which the present translation is made is the second just mentioned, and is that adopted by MM. Adam and Tannery as the more correct, for reasons that they state in detail in the preface to their edition. The work was translated into French by the Duc de Luynes in 1642 and Descartes considered the translation so excellent that he had it published some years later. Clerselier, to complete matters, had the "Objections" also published in French with the "Replies," and this, like the other, was subject to Descartes' revision and correction. This revision renders the French edition specially valuable. Where it seems desirable an alternative reading from the French is given in square brackets.

Elizabeth S. Haldane

TO THE MOST WISE AND ILLUSTRIOUS THE DEAN AND DOCTORS OF THE SACRED FACULTY OF THEOLOGY IN PARIS.

The motive which induces me to present to you this Treatise is so excellent, and, when you become acquainted with its design, I am convinced that you will also have so excellent a motive for taking it under your protection, that I feel that I cannot do better, in order to render it in some sort acceptable to you, than in a few words to state what I have set myself to do.

I have always considered that the two questions respecting God and the Soul were the chief of those that ought to be demonstrated by philosophical rather than theological argument. For although it is quite enough for us faithful ones to accept by means of faith the fact that the human soul

does not perish with the body, and that God exists, it certainly does not seem possible ever to persuade infidels of any religion, indeed, we may almost say, of any moral virtue, unless, to begin with, we prove these two facts by means of the natural reason. And inasmuch as often in this life greater rewards are offered for vice than for virtue, few people would prefer the right to the useful, were they restrained neither by the fear of God nor the expectation of another life; and although it is absolutely true that we must believe that there is a God, because we are so taught in the Holy Scriptures, and, on the other hand, that we must believe the Holy Scriptures because they come from God (the reason of this is, that, faith being a gift of God, He who gives the grace to cause us to believe other things can likewise give it to cause us to believe that He exists), we nevertheless could not place this argument before infidels, who might accuse us of reasoning in a circle. And, in truth, I have noticed that you, along with all the theologians, did not only affirm that the existence of God may be proved by the natural reason, but also that it may be inferred from the Holy Scriptures, that knowledge about Him is much clearer than that which we have of many created things, and, as a matter of fact, is so easy to acquire, that those who have it not are culpable in their ignorance. This indeed appears from the Wisdom of Solomon, chapter xiii., where it is said "Howbeit they are not to be excused; for if their understanding was so great that they could discern the world and the creatures, why did they not rather find out the Lord thereof?" and in Romans, chapter i., it is said that they are "without excuse"; and again in the same place, by these words "that which may be known of God is manifest in them," it seems as through we were shown that all that which can be known of God may be made manifest by means which are not derived from anywhere but from ourselves, and from the simple consideration of the nature of our minds. Hence I thought it not beside my purpose to inquire how this is so, and how God may be more easily and certainly known than the things of the world.

And as regards the soul, although many have considered that it is not easy to know its nature, and some have even dared to say that human reasons have convinced us that it would perish with the body, and that faith alone could believe the contrary, nevertheless, inasmuch as the Lateran Council held under Leo X (in the eighth session) condemns these tenets, and as Leo expressly ordains Christian philosophers to refute their arguments and to employ all their powers in making known the truth, I have ventured in this treatise to undertake the same task.

More than that, I am aware that the principal reason which causes many impious persons not to desire to believe that there is a God, and that the human soul is distinct from the body, is that they declare that hitherto no one has been able to demonstrate these two facts; and although I am not of their opinion but, on the contrary, hold that the greater part of the reasons which have been brought forward concerning these two questions by so many great men are, when they are rightly understood, equal to so many demonstrations, and that it is almost impossible to invent new ones, it is yet in my opinion the case that nothing more useful can be accomplished in philosophy than once for all to seek with care for the best of these reasons, and to set them forth in so clear and exact a manner, that it will henceforth be evident to everybody that

they are veritable demonstrations. And, finally, inasmuch as it was desired that I should undertake this task by many who were aware that I had cultivated a certain Method for the resolution of difficulties of every kind in the Sciences¥a method which it is true is not novel, since there is nothing more ancient than the truth, but of which they were aware that I had made use successfully enough in other matters of difficulty¥I have thought that it was my duty also to make trial of it in the present matter.

Now all that I could accomplish in the matter is contained in this Treatise. Not that I have here drawn together all the different reasons which might be brought forward to serve as proofs of this subject: for that never seemed to be necessary excepting when there was no one single proof that was certain. But I have treated the first and principal ones in such a manner that I can venture to bring them forward as very evident and very certain demonstrations. And more than that, I will say that these proofs are such that I do not think that there is any way open to the human mind by which it can ever succeed in discovering better. For the importance of the subject, and the glory of God to which all this relates, constrain me to speak here somewhat more freely of myself than is my habit. Nevertheless, whatever certainty and evidence I find in my reasons, I cannot persuade myself that all the world is capable of understanding them. Still, just as in Geometry there are many demonstrations that have been left to us by Archimedes, by Apollonius, by Pappus, and others, which are accepted by everyone as perfectly certain and evident (because they clearly contain nothing which, considered by itself, is not very easy to understand, and as all through that which follows has an exact connection with, and dependence on that which precedes), nevertheless, because they are somewhat lengthy, and demand a mind wholly devoted tot heir consideration, they are only taken in and understood by a very limited number of persons. Similarly, although I judge that those of which I here make use are equal to, or even surpass in certainty and evidence, the demonstrations of Geometry, I yet apprehend that they cannot be adequately understood by many, both because they are also a little lengthy and dependent the one on the other, and principally because they demand a mind wholly free of prejudices, and one which can be easily detached from the affairs of the senses. And, truth to say, there are not so many in the world who are fitted for metaphysical speculations as there are for those of Geometry. And more than that; there is still this difference, that in Geometry, since each one is persuaded that nothing must be advanced of which there is not a certain demonstration, those who are not entirely adepts more frequently err in approving what is false, in order to give the impression that they understand it, than in refuting the true. But the case is different in philosophy where everyone believes that all is problematical, and few give themselves to the search after truth; and the greater number, in their desire to acquire a reputation for boldness of thought, arrogantly combat the most important of truths3.

That is why, whatever force there may be in my reasonings, seeing they belong to philosophy, I cannot hope that they will have much effect on the minds of men, unless you extend to them your protection. But the estimation in which you Company is universally held is so great, and the name of SORBONNE carries with it so much authority, that, next

to the Sacred Councils, never has such deference been paid to the judgment of any Body, not only in what concerns the faith, but also in what regards human philosophy as well: everyone indeed believes that it is not possible to discover elsewhere more perspicacity and solidity, or more integrity and wisdom in pronouncing judgment. For this reason I have no doubt that if you deign to take the trouble in the first place of correcting this work (for being conscious not only of my infirmity, but also of my ignorance, I should not dare to state that it was free from errors), and then, after adding to it these things that are lacking to it, completing those which are imperfect, and yourselves taking the trouble to give a more ample explanation of those things which have need of it, or at least making me aware of the defects so that I may apply myself to remedy them4 ¥when this is done and when finally the reasonings by which I prove that there is a God, and that the human soul differs from the body, shall be carried to that point of perspicuity to which I am sure they can be carried in order that they may be esteemed as perfectly exact demonstrations, if you deign to authorize your approbation and to render public testimony to their truth and certainty, I do not doubt, I say, that henceforward all the errors and false opinions which have ever existed regarding these two questions will soon be effaced from the minds of men. For the truth itself will easily cause all men of mind and learning to subscribe to your judgment; and your authority will cause the atheists, who are usually more arrogant than learned or judicious, to rid themselves of their spirit of contradiction or lead them possibly themselves to defend the reasonings which they find being received as demonstrations by all persons of consideration, lest they appear not to understand them. And, finally, all others will easily yield to such a mass of evidence, and there will be none who dares to doubt the existence of God and the real and true distinction between the human soul and the body. It is for you now in your singular wisdom to judge of the importance of the establishment of such beliefs [you who see the disorders produced by the doubt of them]5 . But it would not become me to say more in consideration of the cause of God and religion to those who have always been the most worthy supports of the Catholic Church.

Preface to the Reader.

I have already slightly touched on these two questions of God and the human soul in the Discourse on the Method of rightly conducting the Reason and seeking truth in the Sciences, published in French in the year 1637. Not that I had the design of treating these with any thoroughness, but only so to speak in passing, and in order to ascertain by the judgment of the readers how I should treat them later on. For these questions have always appeared to me to be of such importance that I judged it suitable to speak of them more than once; and the road which I follow in the explanation of them is so little trodden, and so far removed from the ordinary path, that I did not judge it to be expedient to set it forth at length in French and in a Discourse which might be read by everyone, in case the feebler minds should believe that it was permitted to them to attempt to follow the same path.

But, having in this Discourse on Method begged all those

who have found in my writings somewhat deserving of censure to do me the favour of acquainting me with the grounds of it, nothing worthy of remark has been objected to in them beyond two matters: to these two I wish here to reply in a few words before undertaking their more detailed discussion.

The first objection is that it does not follow from the fact that the human mind reflecting on itself does not perceive itself to be other than a thing that thinks, that its nature or its essence consists only in its being a thing that thinks, in the sense that this word only excludes all other things which might also be supposed to pertain to the nature of the soul. To this objection I reply that it was not my intention in that place to exclude these in accordance with the order that looks to the truth of the matter (as to which I was not then dealing), but only in accordance with the order of my thought [perception]; thus my meaning was that so far as I was aware, I knew nothing clearly as belonging to my essence, excepting that I was a thing that thinks, or a thing that has in itself the faculty of thinking. But I shall show hereafter how from the fact that I know no other thing which pertains to my essence, it follows that there is no other thing which really does belong to it.

The second objection is that it does not follow from the fact that I have in myself the idea of something more perfect than I am, that this idea is more perfect than I, and much less that what is represented by this idea exists. But I reply that in this term idea there is here something equivocal, for it may either be taken materially, as an act of my understanding, and in this sense it cannot be said that it is more perfect than I; or it may be taken objectively, as the thing which is represented by this act, which, although we do not suppose it to exist outside of my understanding, may, none the less, be more perfect than I, because of its essence. And in following out this Treatise I shall show more fully how, from the sole fact that I have in myself the idea of a thing more perfect than myself, it follows that this thing truly exists.

In addition to these two objections I have also seen two fairly lengthy works on this subject, which, however, did not so much impugn my reasonings as my conclusions, and this by arguments drawn from the ordinary atheistic sources. But, because such arguments cannot make any impression on the minds of those who really understand my reasonings, and as the judgments of many are so feeble and irrational that they very often allow themselves to be persuaded by the opinions which they have first formed, however false and far removed from reason they may be, rather than by a true and solid but subsequently received refutation of these opinions, I do not desire to reply here to their criticisms in case of being first of all obliged to state them. I shall only say in general that all that is said by the atheist against the existence of God, always depends either on the fact that we ascribe to God affections which are human, or that we attribute so much strength and wisdom to our minds that we even have the presumption to desire to determine and understand that which God can and ought to do. In this way all that they allege will cause us no difficulty, provided only we remember that we must consider our minds as things which are finite and limited, and God as a Being who is incomprehensible and infinite.

Now that I have once for all recognised and acknowledged

the opinions of men, I at once begin to treat of God and the Human soul, and at the same time to treat of the whole of the First Philosophy, without however expecting any praise from the vulgar and without the hope that my book will have many readers. On the contrary, I should never advise anyone to read it excepting those who desire to meditate seriously with me, and who can detach their minds from affairs of sense, and deliver themselves entirely from every sort of prejudice. I know too well that such men exist in a very small number. But for those who, without caring to comprehend the order and connections of my reasonings, form their criticisms on detached portions arbitrarily selected, as is the custom with many, these, I say, will not obtain much profit from reading this Treatise. And although they perhaps in several parts find occasion of cavilling, they can for all their pains make no objection which is urgent or deserving of reply.

And inasmuch as I make no promise to others to satisfy them at once, and as I do not presume so much on my own powers as to believe myself capable of foreseeing all that can cause difficulty to anyone, I shall first of all set forth in these Meditations the very considerations by which I persuade myself that I have reached a certain and evident knowledge of the truth, in order to see if, by the same reasons which persuaded me, I can also persuade others. And, after that, I shall reply to the objections which have been made to me by persons of genius and learning to whom I have sent my Meditations for examination, before submitting them to the press. For they have made so many objections and these so different, that I venture to promise that it will be difficult for anyone to bring to mind criticisms of any consequence which have not been already touched upon. This is why I beg those who read these Meditations to form no judgment upon them unless they have given themselves the trouble to read all the objections as well as the replies which I have made to them.6

Synopsis of the Six Following Meditations.

In the first Meditation I set forth the reasons for which we may, generally speaking, doubt about all things and especially about material things, at least so long as we have no other foundations for the sciences than those which we have hitherto possessed. But although the utility of a Doubt which is so general does not at first appear, it is at the same time very great, inasmuch as it delivers us from every kind of prejudice, and sets out for us a very simple way by which the mind may detach itself from the senses; and finally it makes it impossible for us ever to doubt those things which we have once discovered to be true.

In the second Meditation, mind, which making use of the liberty which pertains to it, takes for granted that all those things of whose existence it has the least doubt, are non-existent, recognises that it is however absolutely impossible that it does not itself exist. This point is likewise of the greatest moment, inasmuch as by this means a distinction is easily drawn between the things which pertain to mind¥that is to say to the intellectual nature¥and those which pertain to body.

But because it may be that some expect from me in this place a statement of the reasons establishing the immortality of the soul, I feel that I should here make known to them that having aimed at writing nothing in all this Treatise of which

I do not possess very exact demonstrations, I am obliged to follow a similar order to that made use of by the geometers, which is to begin by putting forward as premises all those things upon which the proposition that we seek depends, before coming to any conclusion regarding it. Now the first and principal matter which is requisite for thoroughly understanding the immortality of the soul is to form the clearest possible conception of it, and one which will be entirely distinct from all the conceptions which we may have of body; and in this Meditation this has been done. In addition to this it is requisite that we may be assured that all the things which we conceive clearly and distinctly are true in the very way in which we think them; and this could not be proved previously to the Fourth Mediation. Further we must have a distinct conception of corporeal nature, which is given partly in this Second, and partly in the Fifth and Sixth Meditations. And finally we should conclude from all this, that those things which we conceive clearly and distinctly as being diverse substances, as we regard mind and body to be, are really substances essentially distinct one from the other; and this is the conclusion of the Sixth Meditation. This is further confirmed in this same Meditation by the fact that we cannot conceive of body excepting in so far as it is divisible, while the mind cannot be conceived of excepting as indivisible. For we are not able to conceive of the half of a mind as we can do of the smallest of all bodies; so that we see that not only are their natures different but even in some respects contrary to one another. I have not however dealt further with this matter in this treatise, both because what I have said is sufficient to show clearly enough that the extinction of the mind does not follow from the corruption of the body, and also to give men the hope of another life after death, as also because the premises from which the immortality of the soul may be deduced depend on an elucidation of a complete system of Physics. This would mean to establish in the first place that all substances generally¥that is to say all things which cannot exist without being created by God¥are in their nature incorruptible, and that they can never cease to exist unless God, in denying to them his concurrence, reduce them to nought; and secondly that body, regarded generally, is a substance, which is the reason why it also cannot perish, but that the human body, inasmuch as it differs from other bodies, is composed only of a certain configuration of members and of other similar accidents, while the human mind is not similarly composed of any accidents, but is a pure substance. For although all the accidents of mind be changed, although, for instance, it think certain things, will others, perceive others, etc., despite all this it does not emerge from these changes another mind: the human body on the other hand becomes a different thing from the sole fact that the figure or form of any of its portions is found to be changed. From this it follows that the human body may indeed easily enough perish, but the mind [or soul of man (I make no distinction between them)] is owing to its nature immortal.

In the third Meditation it seems to me that I have explained at sufficient length the principal argument of which I make use in order to prove the existence of God. But none the less, because I did not wish in that place to make use of any comparisons derived from corporeal things, so as to withdraw as much as I could the minds of readers from the senses, there may perhaps have remained many obscurities

which, however, will, I hope, be entirely removed by the Replies which I have made to the Objections which have been set before me. Amongst others there is, for example, this one, "How the idea in us of a being supremely perfect possesses so much objective reality [that is to say participates by representation in so many degrees of being and perfection] that it necessarily proceeds from a cause which is absolutely perfect." This is illustrated in these Replies by the comparison of a very perfect machine, the idea of which is found in the mind of some workman. For as the objective contrivance of this idea must have some cause, i.e. either the science of the workman or that of some other from whom he has received the idea, it is similarly impossible that the idea of God which is in us should not have God himself as its cause.

In the fourth Meditation it is shown that all these things which we very clearly and distinctly perceive are true, and at the same time it is explained in what the nature of error or falsity consists. This must of necessity be known both for the confirmation of the preceding truths and for the better comprehension of those that follow. (But it must meanwhile be remarked that I do not in any way there treat of sin¥that is to say of the error which is committed in the pursuit of good and evil, but only of that which arises in the deciding between the true and the false. And I do not intend to speak of matters pertaining to the Faith or the conduct of life, but only of those which concern speculative truths, and which may be known by the sole aid of the light of nature.)

In the fifth Meditation corporeal nature generally is explained, and in addition to this the existence of God is demonstrated by a new proof in which there may possibly be certain difficulties also, but the solution of these will be seen in the Replies to the Objections. And further I show in what sense it is true to say that the certainty of geometrical demonstrations is itself dependent on the knowledge of God.

Finally in the Sixth I distinguish the action of the understanding7 from that of the imagination;8 the marks by which this distinction is made are described. I here show that the mind of man is really distinct from the body, and at the same time that the two are so closely joined together that they form, so to speak, a single thing. All the errors which proceed from the senses are then surveyed, while the means of avoiding them are demonstrated, and finally all the reasons from which we may deduce the existence of material things are set forth. Not that I judge them to be very useful in establishing that which they prove, to wit, that there is in truth a world, that men possess bodies, and other such things which never have been doubted by anyone of sense; but because in considering these closely we come to see that they are neither so strong nor so evident as those arguments which lead us to the knowledge of our mind and of God; so that these last must be the most certain and most evident facts which can fall within the cognizance of the human mind. And this is the whole matter that I have tried to prove in these Meditations, for which reason I here omit to speak of many other questions which I dealt incidentally in this discussion.

MEDITATIONS ON THE FIRST PHILOSOPHY
IN WHICH THE EXISTENCE OF GOD
AND THE DISTINCTION BETWEEN MIND
AND BODY ARE DEMONSTRATED.9

Meditation I.

Of the things which may be brought within the sphere of the doubtful.

It is now some years since I detected how many were the false beliefs that I had from my earliest youth admitted as true, and how doubtful was everything I had since constructed on this basis; and from that time I was convinced that I must once for all seriously undertake to rid myself of all the opinions which I had formerly accepted, and commence to build anew from the foundation, if I wanted to establish any firm and permanent structure in the sciences. But as this enterprise appeared to be a very great one, I waited until I had attained an age so mature that I could not hope that at any later date I should be better fitted to execute my design. This reason caused me to delay so long that I should feel that I was doing wrong were I to occupy in deliberation the time that yet remains to me for action. To-day, then, since very opportunely for the plan I have in view I have delivered my mind from every care [and am happily agitated by no passions] and since I have procured for myself an assured leisure in a peaceable retirement, I shall at last seriously and freely address myself to the general upheaval of all my former opinions.

Now for this object it is not necessary that I should show that all of these are false¥I shall perhaps never arrive at this end. But inasmuch as reason already persuades me that I ought no less carefully to withhold my assent from matters which are not entirely certain and indubitable than from those which appear to me manifestly to be false, if I am able to find in each one some reason to doubt, this will suffice to justify my rejecting the whole. And for that end it will not be requisite that I should examine each in particular, which would be an endless undertaking; for owing to the fact that the destruction of the foundations of necessity brings with it the downfall of the rest of the edifice, I shall only in the first place attack those principles upon which all my former opinions rested.

All that up to the present time I have accepted as most true and certain I have learned either from the senses or through the senses; but it is sometimes proved to me that these senses are deceptive, and it is wiser not to trust entirely to anything by which we have once been deceived.

But it may be that although the senses sometimes deceive us concerning things which are hardly perceptible, or very far away, there are yet many others to be met with as to which we cannot reasonably have any doubt, although we recognise them by their means. For example, there is the fact that I am here, seated by the fire, attired in a dressing gown, having this paper in my hands and other similar matters. And how could I deny that these hands and this body are mine, were it not perhaps that I compare myself to certain persons, devoid of sense, whose cerebella are so troubled and clouded by the violent vapours of black bile, that they constantly assure us that they think they are kings when they are really quite poor, or that they are clothed in purple when they are really without covering, or who imagine that they have an earthenware head or are nothing but pumpkins or are made of glass. But they are mad, and I should not be any the less insane were I to follow examples so extravagant.

At the same time I must remember that I am a man, and that consequently I am in the habit of sleeping, and in my dreams representing to myself the same things or sometimes even less probable things, than do those who are insane in their waking moments. How often has it happened to me that in the night I dreamt that I found myself in this particular place, that I was dressed and seated near the fire, whilst in reality I was lying undressed in bed! At this moment it does indeed seem to me that it is with eyes awake that I am looking at this paper; that this head which I move is not asleep, that it is deliberately and of set purpose that I extend my hand and perceive it; what happens in sleep does not appear so clear nor so distinct as does all this. But in thinking over this I remind myself that on many occasions I have in sleep been deceived by similar illusions, and in dwelling carefully on this reflection I see so manifestly that there are no certain indications by which we may clearly distinguish wakefulness from sleep that I am lost in astonishment. And my astonishment is such that it is almost capable of persuading me that I now dream.

Now let us assume that we are asleep and that all these particulars, e.g. that we open our eyes, shake our head, extend our hands, and so on, are but false delusions; and let us reflect that possibly neither our hands nor our whole body are such as they appear to us to be. At the same time we must at least confess that the things which are represented to us in sleep are like painted representations which can only have been formed as the counterparts of something real and true, and that in this way those general things at least, i.e. eyes, a head, hands, and a whole body, are not imaginary things, but things really existent. For, as a matter of fact, painters, even when they study with the greatest skill to represent sirens and satyrs by forms the most strange and extraordinary, cannot give them natures which are entirely new, but merely make a certain medley of the members of different animals; or if their imagination is extravagant enough to invent something so novel that nothing similar has ever before been seen, and that then their work represents a thing purely fictitious and absolutely false, it is certain all the same that the colours of which this is composed are necessarily real. And for the same reason, although these general things, to with, [a body], eyes, a head, hands, and such like, may be imaginary, we are bound at the same time to confess that there are at least some other objects yet more simple and more universal, which are real and true; and of these just in the same way as with certain real colours, all these images of things which dwell in our thoughts, whether true and real or false and fantastic, are formed.

To such a class of things pertains corporeal nature in general, and its extension, the figure of extended things, their quantity or magnitude and number, as also the place in which they are, the time which measures their duration, and so on.

That is possibly why our reasoning is not unjust when we conclude from this that Physics, Astronomy, Medicine and all other sciences which have as their end the consideration of composite things, are very dubious and uncertain; but that Arithmetic, Geometry and other sciences of that kind which only treat of things that are very simple and very general, without taking great trouble to ascertain whether they are actually existent or not, contain some measure of certainty

and an element of the indubitable. For whether I am awake or asleep, two and three together always form five, and the square can never have more than four sides, and it does not seem possible that truths so clear and apparent can be suspected of any falsity [or uncertainty].

Nevertheless I have long had fixed in my mind the belief that an all-powerful God existed by whom I have been created such as I am. But how do I know that He has not brought it to pass that there is no earth, no heaven, no extended body, no magnitude, no place, and that nevertheless [I possess the perceptions of all these things and that] they seem to me to exist just exactly as I now see them? And, besides, as I sometimes imagine that others deceive themselves in the things which they think they know best, how do I know that I am not deceived every time that I add two and three, or count the sides of a square, or judge of things yet simpler, if anything simpler can be imagined? But possibly God has not desired that I should be thus deceived, for He is said to be supremely good. If, however, it is contrary to His goodness to have made me such that I constantly deceive myself, it would also appear to be contrary to His goodness to permit me to be sometimes deceived, and nevertheless I cannot doubt that He does permit this.

There may indeed be those who would prefer to deny the existence of a God so powerful, rather than believe that all other things are uncertain. But let us not oppose them for the present, and grant that all that is here said of a God is a fable; nevertheless in whatever way they suppose that I have arrived at the state of being that I have reached¥whether they attribute it to fate or to accident, or make out that it is by a continual succession of antecedents, or by some other method¥since to err and deceive oneself is a defect, it is clear that the greater will be the probability of my being so imperfect as to deceive myself ever, as is the Author to whom they assign my origin the less powerful. To these reasons I have certainly nothing to reply, but at the end I feel constrained to confess that there is nothing in all that I formerly believed to be true, of which I cannot in some measure doubt, and that not merely through want of thought or through levity, but for reasons which are very powerful and maturely considered; so that henceforth I ought not the less carefully to refrain from giving credence to these opinions than to that which is manifestly false, if I desire to arrive at any certainty [in the sciences].

But it is not sufficient to have made these remarks, we must also be careful to keep them in mind. For these ancient and commonly held opinions still revert frequently to my mind, long and familiar custom having given them the right to occupy my mind against my inclination and rendered them almost masters of my belief; nor will I ever lose the habit of deferring to them or of placing my confidence in them, so long as I consider them as they really are, i.e. opinions in some measure doubtful, as I have just shown, and at the same time highly probable, so that there is much more reason to believe in than to deny them. That is why I consider that I shall not be acting amiss, if, taking of set purpose a contrary belief, I allow myself to be deceived, and for a certain time pretend that all these opinions are entirely false and imaginary, until at last, having thus balanced my former prejudices with my latter [so that they cannot divert my opinions more to one side than to the other], my judgment will no longer be

dominated by bad usage or turned away from the right knowledge of the truth. For I am assured that there can be neither peril nor error in this course, and that I cannot at present yield too much to distrust, since I am not considering the question of action, but only of knowledge.

I shall then suppose, not that God who is supremely good and the fountain of truth, but some evil genius not less powerful than deceitful, has employed his whole energies in deceiving me; I shall consider that the heavens, the earth, colours, figures, sound, and all other external things are nought but the illusions and dreams of which this genius has availed himself in order to lay traps for my credulity; I shall consider myself as having no hands, no eyes, no flesh, no blood, nor any senses, yet falsely believing myself to possess all these things; I shall remain obstinately attached to this idea, and if by this means it is not in my power to arrive at the knowledge of any truth, I may at least do what is in my power [i.e. suspend my judgment], and with firm purpose avoid giving credence to any false thing, or being imposed upon by this arch deceiver, however powerful and deceptive he may be. But this task is a laborious one, and insensibly a certain lassitude leads me into the course of my ordinary life. And just as a captive who in sleep enjoys an imaginary liberty, when he begins to suspect that his liberty is but a dream, fears to awaken, and conspires with these agreeable illusions that the deception may be prolonged, so insensibly of my own accord I fall back into my former opinions, and I dread awakening from this slumber, lest the laborious wakefulness which would follow the tranquillity of this repose should have to be spent not in daylight, but in the excessive darkness of the difficulties which have just been discussed.

Meditation II

Of the Nature of the Human Mind; and that it is more easily known than the Body.

The Meditation of yesterday filled my mind with so many doubts that it is no longer in my power to forget them. And yet I do not see in what manner I can resolve them; and, just as if I had all of a sudden fallen into very deep water, I am so disconcerted that I can neither make certain of setting my feet on the bottom, nor can I swim and so support myself on the surface. I shall nevertheless make an effort and follow anew the same path as that on which I yesterday entered, i.e. I shall proceed by setting aside all that in which the least doubt could be supposed to exist, just as if I had discovered that it was absolutely false; and I shall ever follow in this road until I have met with something which is certain, or at least, if I can do nothing else, until I have learned for certain that there is nothing in the world that is certain. Archimedes, in order that he might draw the terrestrial globe out of its place, and transport it elsewhere, demanded only that one point should be fixed and immoveable; in the same way I shall have the right to conceive high hopes if I am happy enough to discover one thing only which is certain and indubitable.

I suppose, then, that all the things that I see are false; I persuade myself that nothing has ever existed of all that my fallacious memory represents to me. I consider that I

possess no senses; I imagine that body, figure, extension, movement and place are but the fictions of my mind. What, then, can be esteemed as true? Perhaps nothing at all, unless that there is nothing in the world that is certain.

But how can I know there is not something different from those things that I have just considered, of which one cannot have the slightest doubt? Is there not some God, or some other being by whatever name we call it, who puts these reflections into my mind? That is not necessary, for is it not possible that I am capable of producing them myself? I myself, am I not at least something? But I have already denied that I had senses and body. Yet I hesitate, for what follows from that? Am I so dependent on body and senses that I cannot exist without these? But I was persuaded that there was nothing in all the world, that there was no heaven, no earth, that there were no minds, nor any bodies: was I not then likewise persuaded that I did not exist? Not at all; of a surety I myself did exist since I persuaded myself of something [or merely because I thought of something]. But there is some deceiver or other, very powerful and very cunning, who ever employs his ingenuity in deceiving me. Then without doubt I exist also if he deceives me, and let him deceive me as much as he will, he can never cause me to be nothing so long as I think that I am something. So that after having reflected well and carefully examined all things, we must come to the definite conclusion that this proposition: I am, I exist, is necessarily true each time that I pronounce it, or that I mentally conceive it.

But I do not yet know clearly enough what I am, I who am certain that I am; and hence I must be careful to see that I do not imprudently take some other object in place of myself, and thus that I do not go astray in respect of this knowledge that I hold to be the most certain and most evident of all that I have formerly learned. That is why I shall now consider anew what I believed myself to be before I embarked upon these last reflections; and of my former opinions I shall withdraw all that might even in a small degree be invalidated by the reasons which I have just brought forward, in order that there may be nothing at all left beyond what is absolutely certain and indubitable.

What then did I formerly believe myself to be? Undoubtedly I believed myself to be a man. But what is a man? Shall I say a reasonable animal? Certainly not; for then I should have to inquire what an animal is, and what is reasonable; and thus from a single question I should insensibly fall into an infinitude of others more difficult; and I should not wish to waste the little time and leisure remaining to me in trying to unravel subtleties like these. But I shall rather stop here to consider the thoughts which of themselves spring up in my mind, and which were not inspired by anything beyond my own nature alone when I applied myself to the consideration of my being. In the first place, the, I considered myself as having a face, hands, arms, and all that system of members composed on bones and flesh as seen in a corpse which I designated by the name of body. In addition to this I considered that I was nourished, that I walked, that I felt, and that I thought, and I referred all these actions to the soul: but I did not stop to consider what the soul was, or if I did stop, I imagined that it was something extremely rare and subtle like a wind, a flame, or an ether, which was spread throughout my grosser parts. As to body I had no

manner of doubt about its nature, but thought I had a very clear knowledge of it; and if I had desired to explain it according to the notions that I had then formed of it, I should have described it thus: By the body I understand all that which can be defined by a certain figure: something which can be confined in a certain place, and which can fill a given space in such a way that every other body will be excluded from it; which can be perceived either by tough, or by sight, or by hearing, or by taste, or by smell: which can be moved in many ways not, in truth, by itself, but by something which is foreign to it, by which it is touched [and from which it receives impressions]: for to have the power of self-movement, as also of feeling or of thinking, I did not consider to appertain to the nature of body: on the contrary, I was rather astonished to find that faculties similar to them existed in some bodies.

But what am I, now that I suppose that there is a certain genius which is extremely powerful, and, if I may say so, malicious, who employs all his powers in deceiving me? Can I affirm that I possess the least of all those things which I have just said pertain to the nature of body? I pause to consider, I revolve all these things in my mind, and I find none of which I can say that it pertains to me. It would be tedious to stop to enumerate them. Let us pass to the attributes of soul and see if there is any one which is in me? What of nutrition or walking [the first mentioned]? But if it is so that I have no body it is also true that I can neither walk nor take nourishment. Another attribute is sensation. But one cannot feel without body, and besides I have thought I perceived many things during sleep that I recognised in my waking moments as not having been experienced at all. What of thinking? I find here that thought is an attribute that belongs to me; it alone cannot be separated from me. I am, I exist, that is certain. But how often? Just when I think; for it might possibly be the case if I ceased entirely to think, that I should likewise cease altogether to exist. I do not now admit anything which is not necessarily true: to speak accurately I am not more than a thing which thinks, that is to say a mind or a soul, or an understanding, or a reason, which are terms whose significance was formerly unknown to me. I am, however, a real thing and really exist; but what thing? I have answered: a thing which thinks.

And what more? I shall exercise my imagination [in order to see if I am not something more]. I am not a collection of members which we call the human body: I am not a subtle air distributed through these members, I am not a wind, a fire, a vapour, a breath, nor anything at all which I can imagine or conceive; because I have assumed that all these were nothing. Without changing that supposition I find that I only leave myself certain of the fact that I am somewhat. But perhaps it is true that these same things which I supposed were non-existent because they are unknown to me, are really not different from the self which I know. I am not sure about this, I shall not dispute about it now; I can only give judgment on things that are known to me. I know that I exist, and I inquire what I am, I whom I know to exist. But it is very certain that the knowledge of my existence taken in its precise significance does not depend on things whose existence is not yet known to me; consequently it does not depend on those which I can feign in imagination. And indeed the very term feign in imagination10 proves to me my error, for I

really do this if I image myself a something, since to imagine is nothing else than to contemplate the figure or image of a corporeal thing. But I already know for certain that I am, and that it may be that all these images, and, speaking generally, all things that relate to the nature of body are nothing but dreams [and chimeras]. For this reason I see clearly that I have as little reason to say, "I shall stimulate my imagination in order to know more distinctly what I am," than if I were to say, "I am now awake, and I perceive somewhat that is real and true: but because I do not yet perceive it distinctly enough, I shall go to sleep of express purpose, so that my dreams may represent the perception with greatest truth and evidence." And, thus, I know for certain that nothing of all that I can understand by means of my imagination belongs to this knowledge which I have of myself, and that it is necessary to recall the mind from this mode of thought with the utmost diligence in order that it may be able to know its own nature with perfect distinctness.

But what then am I? A thing which thinks. What is a thing which thinks? It is a thing which doubts, understands, [conceives], affirms, denies, wills, refuses, which also imagines and feels.

Certainly it is no small matter if all these things pertain to my nature. But why should they not so pertain? Am I not that being who now doubts nearly everything, who nevertheless understands certain things, who affirms that one only is true, who denies all the others, who desires to know more, is averse from being deceived, who imagines many things, sometimes indeed despite his will, and who perceives many likewise, as by the intervention of the bodily organs? Is there nothing in all this which is as true as it is certain that I exist, even though I should always sleep and though he who has given me being employed all his ingenuity in deceiving me? Is there likewise any one of these attributes which can be distinguished from my thought, or which might be said to be separated from myself? For it is so evident of itself that it is I who doubts, who understands, and who desires, that there is no reason here to add anything to explain it. And I have certainly the power of imagining likewise; for although it may happen (as I formerly supposed) that none of the things which I imagine are true, nevertheless this power of imagining does not cease to be really in use, and it forms part of my thought. Finally, I am the same who feels, that is to say, who perceives certain things, as by the organs of sense, since it truth I see light, I hear noise, I feel heat. But it will be said that these phenomena are false and that I am dreaming. Let it be so; still it is at least quite certain that it seems to me that I see light, that I hear noise and that I feel heat. That cannot be false; properly speaking it is what is in me called feeling;11 and used in this precise sense that is no other thing than thinking.

From this time I begin to know what I am with a little more clearness and distinction than before; but nevertheless it still seems to me, and I cannot prevent myself from thinking, that corporeal things, whose images are framed by thought, which are tested by the senses, are much more distinctly known than that obscure part of me which does not come under the imagination. Although really it is very strange to say that I know and understand more distinctly these things whose existence seems to me dubious, which are unknown to me, and which do not belong to me, than others of

the truth of which I am convinced, which are known to me and which pertain to my real nature, in a word, than myself. But I see clearly how the case stands: my mind loves to wander, and cannot yet suffer itself to be retained within the just limits of truth. Very good, let us once more give it the freest rein, so that, when afterwards we seize the proper occasion for pulling up, it may the more easily be regulated and controlled.

Let us begin by considering the commonest matters, those which we believe to be the most distinctly comprehended, to wit, the bodies which we touch and see; not indeed bodies in general, for these general ideas are usually a little more confused, but let us consider one body in particular. Let us take, for example, this piece of wax: it has been taken quite freshly from the hive, and it has not yet lost the sweetness of the honey which it contains; it still retains somewhat of the odour of the flowers from which it has been culled; its colour, its figure, its size are apparent; it is hard, cold, easily handled, and if you strike it with the finger, it will emit a sound. Finally all the things which are requisite to cause us distinctly to recognise a body, are met with in it. But notice that while I speak and approach the fire what remained of the taste is exhaled, the smell evaporates, the colour alters, the figure is destroyed, the size increases, it becomes liquid, it heats, scarcely can one handle it, and when one strikes it, now sound is emitted. Does the same wax remain after this change? We must confess that it remains; none would judge otherwise. What then did I know so distinctly in this piece of wax? It could certainly be nothing of all that the senses brought to my notice, since all these things which fall under taste, smell, sight, touch, and hearing, are found to be changed, and yet the same wax remains.

Perhaps it was what I now think, viz. that this wax was not that sweetness of honey, nor that agreeable scent of flowers, nor that particular whiteness, nor that figure, nor that sound, but simply a body which a little while before appeared tome as perceptible under these forms, and which is now perceptible under others. But what, precisely, is it that I imagine when I form such conceptions? Let us attentively consider this, and, abstracting from all that does not belong to the wax, let us see what remains. Certainly nothing remains excepting a certain extended thing which is flexible and movable. But what is the meaning of flexible and movable? Is it not that I imagine that this piece of wax being round is capable of becoming square and of passing from a square to a triangular figure? No, certainly it is not that, since I imagine it admits of an infinitude of similar changes, and I nevertheless do not know how to compass the infinitude by my imagination, and consequently this conception which I have of the wax is not brought about by the faculty of imagination. What now is this extension? Is it not also unknown? For it becomes greater when the wax is melted, greater when it is boiled, and greater still when the heat increases; and I should not conceive [clearly] according to truth what wax is, if I did not think that even this piece that we are considering is capable of receiving more variations in extension than I have ever imagined. We must then grant that I could not even understand through the imagination what this piece of wax is, and that it is my mind12 alone which perceives it. I say this piece of wax in particular, for as

to wax in general it is yet clearer. But what is this piece of wax which cannot be understood excepting by the [understanding or] mind? It is certainly the same that I see, touch, imagine, and finally it is the same which I have always believed it to be from the beginning. But what must particularly be observed is that its perception is neither an act of vision, nor of touch, nor of imagination, and has never been such although it may have appeared formerly to be so, but only an intuition13 of the mind, which may be imperfect and confused as it was formerly, or clear and distinct as it is at present, according as my attention is more or less directed to the elements which are found in it, and of which it is composed.

Yet in the meantime I am greatly astonished when I consider [the great feebleness of mind] and its proneness to fall [insensibly] into error; for although without giving expression to my thought I consider all this in my own mind, words often impede me and I am almost deceived by the terms of ordinary language. For we say that we see the same wax, if it is present, and not that we simply judge that it is the same from its having the same colour and figure. From this I should conclude that I knew the wax by means of vision and not simply by the intuition of the mind; unless by chance I remember that, when looking from a window and saying I see men who pass in the street, I really do not see them, but infer that what I see is men, just as I say that I see wax. And yet what do I see from the window but hats and coats which may cover automatic machines? Yet I judge these to be men. And similarly solely by the faculty of judgment which rests in my mind, I comprehend that which I believed I saw with my eyes.

A man who makes it his aim to raise his knowledge above the common should be ashamed to derive the occasion for doubting from the forms of speech invented by the vulgar; I prefer to pass on and consider whether I had a more evident and perfect conception of what the wax was when I first perceived it, and when I believed I knew it by means of the external senses or at least by the common sense14 as it is called, that is to say by the imaginative faculty, or whether my present conception is clearer now that I have most carefully examined what it is, and in what way it can be known. It would certainly be absurd to doubt as to this. For what was there in this first perception which was distinct? What was there which might not as well have been perceived by any of the animals? But when I distinguish the wax from its external forms, and when, just as if I had taken from it its vestments, I consider it quite naked, it is certain that although some error may still be found in my judgment, I can nevertheless not perceive it thus without a human mind.

But finally what shall I say of this mind, that is, of myself, for up to this point I do not admit in myself anything but mind? What then, I who seem to perceive this piece of wax so distinctly, do I not know myself, not only with much more truth and certainty, but also with much more distinctness and clearness? For if I judge that the wax is or exists from the fact that I see it, it certainly follows much more clearly that I am or that I exist myself from the fact that I see it. For it may be that what I see is not really wax, it may also be that I do not possess eyes with which to see anything; but it cannot be that when I see, or (for I no longer take account of the distinction) when I think I see, that I myself who think am nought. So if I judge that the wax exists from the

fact that I touch it, the same thing will follow, to wit, that I am; and if I judge that my imagination, or some other cause, whatever it is, persuades me that the wax exists, I shall still conclude the same. And what I have here remarked of wax may be applied to all other things which are external to me [and which are met with outside of me]. And further, if the [notion or] perception of wax has seemed to me clearer and more distinct, not only after the sight or the touch, but also after many other causes have rendered it quite manifest to me, with how much more [evidence] and distinctness must it be said that I now know myself, since all the reasons which contribute to the knowledge of wax, or any other body whatever, are yet better proofs of the nature of my mind! And there are so many other things in the mind itself which may contribute to the elucidation of its nature, that those which depend on body such as these just mentioned, hardly merit being taken into account.

But finally here I am, having insensibly reverted to the point I desired, for, since it is now manifest to me that even bodies are not properly speaking known by the senses or by the faculty of imagination, but by the understanding only, and since they are not known from the fact that they are seen or touched, but only because they are understood, I see clearly that there is nothing which is easier for me to know than my mind. But because it is difficult to rid oneself so promptly of an opinion to which one was accustomed for so long, it will be well that I should halt a little at this point, so that by the length of my meditation I may more deeply imprint on my memory this new knowledge.

Meditation III.

Of God: that He exists.

I shall now close my eyes, I shall stop my ears, I shall call away all my senses, I shall efface even from my thoughts all the images of corporeal things, or at least (for that is hardly possible) I shall esteem them as vain and false; and thus holding converse only with myself and considering my own nature, I shall try little by little to reach a better knowledge of and a more familiar acquaintanceship with myself. I am a thing that thinks, that is to say, that doubts, affirms, denies, that knows a few things, that is ignorant of many [that loves, that hates], that wills, that desires, that also imagines and perceives; for as I remarked before, although the things which I perceive and imagine are perhaps nothing at all apart from me and in themselves, I am nevertheless assured that these modes of thought that I call perceptions and imaginations, inasmuch only as they are modes of thought, certainly reside [and are met with] in me.

And in the little that I have just said, I think I have summed up all that I really know, or at least all that hitherto I was aware that I knew. In order to try to extend my knowledge further, I shall now look around more carefully and see whether I cannot still discover in myself some other things which I have not hitherto perceived. I am certain that I am a thing which thinks; but do I not then likewise know what is requisite to render me certain of a truth? Certainly in this first knowledge there is nothing that assures me of its truth, excepting the clear and distinct perception of that which I state, which would not indeed suffice to assure me

that what I say is true, if it could ever happen that a thing which I conceived so clearly and distinctly could be false; and accordingly it seems to me that already I can establish as a general rule that all things which I perceive15 very clearly and very distinctly are true.

At the same time I have before received and admitted many things to be very certain and manifest, which yet I afterwards recognised as being dubious. What then were these things? They were the earth, sky, stars and all other objects which I apprehended by means of the senses. But what did I clearly [and distinctly] perceive in them? Nothing more than that the ideas or thoughts of these things were presented to my mind. And not even now do I deny that these ideas are met with in me. But there was yet another thing which I affirmed, and which, owing to the habit which I had formed of believing it, I thought I perceived very clearly, although in truth I did not perceive it at all, to wit, that there were objects outside of me from which these ideas proceeded, and to which they were entirely similar. And it was in this that I erred, or, if perchance my judgment was correct, this was not due to any knowledge arising from my perception.

But when I took anything very simple and easy in the sphere of arithmetic or geometry into consideration, e.g. that two and three together made five, and other things of the sort, were not these present to my mind so clearly as to enable me to affirm that they were true? Certainly if I judged that since such matters could be doubted, this would not have been so for any other reason than that it came into my mind that perhaps a God might have endowed me with such a nature that I may have been deceived even concerning things which seemed to me most manifest. But every time that this preconceived opinion of the sovereign power of a God presents itself to my thought, I am constrained to confess that it is easy to Him, if He wishes it, to cause me to err, even in matters in which I believe myself to have the best evidence. And, on the other hand, always when I direct my attention to things which I believe myself to perceive very clearly, I am so persuaded of their truth that I let myself break out into words such as these: Let who will deceive me, He can never cause me to be nothing while I think that I am, or some day cause it to be true to say that I have never been, it being true now to say that I am, or that two and three make more or less than five, or any such thing in which I see a manifest contradiction. And, certainly, since I have no reason to believe that there is a God who is a deceiver, and as I have not yet satisfied myself that there is a God at all, the reason for doubt which depends on this opinion alone is very slight, and so to speak metaphysical. But in order to be able altogether to remove it, I must inquire whether there is a God as soon as the occasion presents itself; and if I find that there is a God, I must also inquire whether He may be a deceiver; for without a knowledge of these two truths I do not see that I can ever be certain of anything.

And in order that I may have an opportunity of inquiring into this in an orderly way [without interrupting the order of meditation which I have proposed to myself, and which is little by little to pass from the notions which I find first of all in my mind to those which I shall later on discover in it] it is requisite that I should here divide my thoughts into certain kinds, and that I should consider in which of these kinds there is, properly speaking, truth or error to be found.

Of my thoughts some are, so to speak, images of the things, and to these alone is the title "idea" properly applied; examples are my thought of a man or of a chimera, of heaven, of an angel, or [even] of God. But other thoughts possess other forms as well. For example in willing, fearing, approving, denying, though I always perceive something as the subject of the action of my mind,16 yet by this action I always add something else to the idea17 which I have of that thing; and of the thoughts of this kind some are called volitions or affections, and others judgments.

Now as to what concerns ideas, if we consider them only in themselves and do not relate them to anything else beyond themselves, they cannot properly speaking be false; for whether I imagine a goat or a chimera, it is not less true that I imagine the one that the other. We must not fear likewise that falsity can enter into will and into affections, for although I may desire evil things, or even things that never existed, it is not the less true that I desire them. Thus there remains no more than the judgments which we make, in which I must take the greatest care not o deceive myself. But the principal error and the commonest which we may meet with in them, consists in my judging that the ideas which are in me are similar or conformable to the things which are outside me; for without doubt if I considered the ideas only as certain modes of my thoughts, without trying to relate them to anything beyond, they could scarcely give me material for error.

But among these ideas, some appear to me to be innate, some adventitious, and others to be formed [or invented] by myself; for, as I have the power of understanding what is called a thing, or a truth, or a thought, it appears to me that I hold this power from no other source than my own nature. But if I now hear some sound, if I see the sun, or feel heat, I have hitherto judged that these sensations proceeded from certain things that exist outside of me; and finally it appears to me that sirens, hippogryphs, and the like, are formed out of my own mind. But again I may possibly persuade myself that all these ideas are of the nature of those which I term adventitious, or else that they are all innate, or all fictitious: for I have not yet clearly discovered their true origin.

And my principal task in this place is to consider, in respect to those ideas which appear to me to proceed from certain objects that are outside me, what are the reasons which cause me to think them similar to these objects. It seems indeed in the first place that I am taught this lesson by nature; and, secondly, I experience in myself that these ideas do not depend on my will nor therefore on myself¥for they often present themselves to my mind in spite of my will. Just now, for instance, whether I will or whether I do not will, I feel heat, and thus I persuade myself that this feeling, or at least this idea of heat, is produced in me by something which is different from me, i.e. by the heat of the fire near which I sit. And nothing seems to me more obvious than to judge that this object imprints its likeness rather than anything else upon me.

Now I must discover whether these proofs are sufficiently strong and convincing. When I say that I am so instructed by nature, I merely mean a certain spontaneous inclination which impels me to believe in this connection, and not a natural light which makes me recognise that it is true. But these two

things are very different; for I cannot doubt that which the natural light causes me to believe to be true, as, for example, it has shown me that I am from the fact that I doubt, or other facts of the same kind. And I possess no other faculty whereby to distinguish truth from falsehood, which can teach me that what this light shows me to be true is not really true, and no other faculty that is equally trustworthy. But as far as [apparently] natural impulses are concerned, I have frequently remarked, when I had to make active choice between virtue and vice, that they often enough led me to the part that was worse; and this is why I do not see any reason for following them in what regards truth and error.

And as to the other reason, which is that these ideas must proceed from objects outside me, since they do not depend on my will, I do not find it any the more convincing. For just as these impulses of which I have spoken are found in me, notwithstanding that they do not always concur with my will, so perhaps there is in me some faculty fitted to produce these ideas without the assistance of any external things, even though it is not yet known by me; just as, apparently, they have hitherto always been found in me during sleep without the aid of any external objects.

And finally, though they did proceed from objects different from myself, it is not a necessary consequence that they should resemble these. On the contrary, I have noticed that in many cases there was a great difference between the object and its idea. I find, for example, two completely diverse ideas of the sun in my mind; the one derives its origin from the senses, and should be placed in the category of adventitious ideas; according to this idea the sun seems to be extremely small; but the other is derived from astronomical reasonings, i.e. is elicited from certain notions that are innate in me, or else it is formed by me in some other manner; in accordance with it the sun appears to be several times greater than the earth. These two ideas cannot, indeed, both resemble the same sun, and reason makes me believe that the one which seems to have originated directly from the sun itself, is the one which is most dissimilar to it.

All this causes me to believe that until the present time it has not been by a judgment that was certain [or premeditated], but only by a sort of blind impulse that I believed that things existed outside of, and different from me, which, by the organs of my senses, or by some other method whatever it might be, conveyed these ideas or images to me [and imprinted on me their similitudes].

But there is yet another method of inquiring whether any of the objects of which I have ideas within me exist outside of me. If ideas are only taken as certain modes of thought, I recognise amongst them no difference or inequality, and all appear to proceed from me in the same manner; but when we consider them as images, one representing one thing and the other another, it is clear that they are very different one from the other. There is no doubt that those which represent to me substances are something more, and contain so to speak more objective reality within them [that is to say, by representation participate in a higher degree of being or perfection] than those that simply represent modes or accidents; and that idea again by which I understand a supreme God, eternal, infinite, [immutable], omniscient, omnipotent, and Creator of all things which are outside of Himself, has certainly more objective reality in itself than those ideas by

which finite substances are represented.

Now it is manifest by the natural light that there must at least be as much reality in the efficient and total cause as in its effect. For, pray, whence can the effect derive its reality, if not from its cause? And in what way can this cause communicate this reality to it, unless it possessed it in itself? And from this it follows, not only that something cannot proceed from nothing, but likewise that what is more perfect¥that is to say, which has more reality within itself¥cannot proceed from the less perfect. And this is not only evidently true of those effects which possess actual or formal reality, but also of the ideas in which we consider merely what is termed objective reality. To take an example, the stone which has not yet existed not only cannot now commence to be unless it has been produced by something which possesses within itself, either formally or eminently, all that enters into the composition of the stone [i.e. it must possess the same things or other more excellent things than those which exist in the stone] and heat can only be produced in a subject in which it did not previously exist by a cause that is of an order [degree or kind] at least as perfect as heat, and so in all other cases. But further, the idea of heat, or of a stone, cannot exist in me unless it has been placed within me by some cause which possesses within it at least as much reality as that which I conceive to exist in the heat or the stone. For although this cause does not transmit anything of its actual or formal reality to my idea, we must not for that reason imagine that it is necessarily a less real cause; we must remember that [since every idea is a work of the mind] its nature is such that it demands of itself no other formal reality than that which it borrows from my thought, of which it is only a mode [i.e. a manner or way of thinking]. But in order that an idea should contain some one certain objective reality rather than another, it must without doubt derive it from some cause in which there is at least as much formal reality as this idea contains of objective reality. For if we imagine that something is found in an idea which is not found in the cause, it must then have been derived from nought; but however imperfect may be this mode of being by which a thing is objectively [or by representation] in the understanding by its idea, we cannot certainly say that this mode of being is nothing, nor consequently, that the idea derives its origin from nothing.

Nor must I imagine that, since the reality that I consider in these ideas is only objective, it is not essential that this reality should be formally in the causes of my ideas, but that it is sufficient that it should be found objectively. For just as this mode of objective existence pertains to ideas by their proper nature, so does the mode of formal existence pertain tot he causes of those ideas (this is at least true of the first and principal) by the nature peculiar to them. And although it may be the case that one idea gives birth to another idea, that cannot continue to be so indefinitely; for in the end we must reach an idea whose cause shall be so to speak an archetype, in which the whole reality [or perfection] which is so to speak objectively [or by representation] in these ideas is contained formally [and really]. Thus the light of nature causes me to know clearly that the ideas in me are like [pictures or] images which can, in truth, easily fall short of the perfection of the objects from which they have been derived, but which can never contain

anything greater or more perfect.

And the longer and the more carefully that I investigate these matters, the more clearly and distinctly do I recognise their truth. But what am I to conclude from it all in the end? It is this, that if the objective reality of any one of my ideas is of such a nature as clearly to make me recognise that it is not in me either formally or eminently, and that consequently I cannot myself be the cause of it, it follows of necessity that I am not alone in the world, but that there is another being which exists, or which is the cause of this idea. On the other hand, had no such an idea existed in me, I should have had no sufficient argument to convince me of the existence of any being beyond myself; for I have made very careful investigation everywhere and up to the present time have been able to find no other ground.

But of my ideas, beyond that which represents me to myself, as to which there can here be no difficulty, there is another which represents a God, and there are others representing corporeal and inanimate things, others angels, others animals, and others again which represent to me men similar to myself.

As regards the ideas which represent to me other men or animals, or angels, I can however easily conceive that they might be formed by an admixture of the other ideas which I have of myself, of corporeal things, and of God, even although there were apart from me neither men nor animals, nor angels, in all the world.

And in regard to the ideas of corporeal objects, I do not recognise in them anything so great or so excellent that they might not have possibly proceeded from myself; for if I consider them more closely, and examine them individually, as I yesterday examined the idea of wax, I find that there is very little in them which I perceive clearly and distinctly. Magnitude or extension in length, breadth, or depth, I do so perceive; also figure which results from a termination of this extension, the situation which bodies of different figure preserve in relation to one another, and movement or change of situation; to which we may also add substance, duration and number. As to other things such as light, colours, sounds, scents, tastes, heat, cold and the other tactile qualities, they are thought by me with so much obscurity and confusion that I do not even know if they are true or false, i.e. whether the ideas which I form of these qualities are actually the ideas of real objects or not [or whether they only represent chimeras which cannot exist in fact]. For although I have before remarked that it is only in judgments that falsity, properly speaking, or formal falsity, can be met with, a certain material falsity may nevertheless be found in ideas, i.e. when these ideas represent what is nothing as though it were something. For example, the ideas which I have of cold and heat are so far from clear and distinct that by their means I cannot tell whether cold is merely a privation of heat, or heat a privation of cold, or whether both are real qualities, or are not such. And inasmuch as [since ideas resemble images] there cannot be any ideas which do not appear to represent some things, if it is correct to say that cold is merely a privation of heat, the idea which represents it to me as something real and positive will not be improperly termed false, and the same holds good of other similar ideas.

To these it is certainly not necessary that I should attribute any author other than myself. For if they are

false, i.e. if they represent things which do not exist, the light of nature shows me that they issue from nought, that is to say, that they are only in me so far as something is lacking to the perfection of my nature. But if they are true, nevertheless because they exhibit so little reality to me that I cannot even clearly distinguish the thing represented from non-being, I do not see any reason why they should not be produced by myself.

As to the clear and distinct idea which I have of corporeal things, some of them seem as though I might have derived them from the idea which I possess of myself, as those which I have of substance, duration, number, and such like. For [even] when I think that a stone is a substance, or at least a thing capable of existing of itself, and that I am a substance also, although I conceive that I am a thing that thinks and not one that is extended, and that the stone on the other hand is an extended thing which does not think, and that thus there is a notable difference between the two conceptions¥they seem, nevertheless, to agree in this, that both represent substances. In the same way, when I perceive that I now exist and further recollect that I have in former times existed, and when I remember that I have various thoughts of which I can recognise the number, I acquire ideas of duration and number which I can afterwards transfer to any object that I please. But as to all the other qualities of which the ideas of corporeal things are composed, to wit, extension, figure, situation and motion, it is true that they are not formally in me, since I am only a thing that thinks; but because they are merely certain modes of substance [and so to speak the vestments under which corporeal substance appears to us] and because I myself am also a substance, it would seem that they might be contained in me eminently.

Hence there remains only the idea of God, concerning which we must consider whether it is something which cannot have proceeded from me myself. By the name God I understand a substance that is infinite [eternal, immutable], independent, all-knowing, all-powerful, and by which I myself and everything else, if anything else does exist, have been created. Now all these characteristics are such that the more diligently I attend to them, the less do they appear capable of proceeding from me alone; hence, from what has been already said, we must conclude that God necessarily exists.

For although the idea of substance is within me owing to the fact that I am substance, nevertheless I should not have the idea of an infinite substance¥since I am finite¥if it had not proceeded from some substance which was veritably infinite.

Nor should I imagine that I do not perceive the infinite by a true idea, but only by the negation of the finite, just as I perceive repose and darkness by the negation of movement and of light; for, on the contrary, I see that there is manifestly more reality in infinite substance than in finite, and therefore that in some way I have in me the notion of the infinite earlier then the finite¥to wit, the notion of God before that of myself. For how would it be possible that I should know that I doubt and desire, that is to say, that something is lacking to me, and that I am not quite perfect, unless I had within me some idea of a Being more perfect than myself, in comparison with which I should recognise the deficiencies of my nature?

And we cannot say that this idea of God is perhaps

materially false and that consequently I can derive it from nought [i.e. that possibly it exists in me because I am imperfect], as I have just said is the case with ideas of heat, cold and other such things; for, on the contrary, as this idea is very clear and distinct and contains within it more objective reality than any other, there can be none which is of itself more true, nor any in which there can be less suspicion of falsehood. The idea, I say, of this Being who is absolutely perfect and infinite, is entirely true; for although, perhaps, we can imagine that such a Being does not exist, we cannot nevertheless imagine that His idea represents nothing real to me, as I have said of the idea of cold. This idea is also very clear and distinct; since all that I conceive clearly and distinctly of the real and the true, and of what conveys some perfection, is in its entirety contained in this idea. And this does not cease to be true although I do not comprehend the infinite, or though in God there is an infinitude of things which I cannot comprehend, nor possibly even reach in any way by thought; for it is of the nature of the infinite that my nature, which is finite and limited, should not comprehend it; and it is sufficient that I should understand this, and that I should judge that all things which I clearly perceive and in which I know that there is some perfection, and possibly likewise an infinitude of properties of which I am ignorant, are in God formally or eminently, so that the idea which I have of Him may become the most true, most clear, and most distinct of all the ideas that are in my mind.

But possibly I am something more than I suppose myself to be, and perhaps all those perfections which I attribute to God are in some way potentially in me, although they do not yet disclose themselves, or issue in action. As a matter of fact I am already sensible that my knowledge increases [and perfects itself] little by little, and I see nothing which can prevent it from increasing more and more into infinitude; nor do I see, after it has thus been increased [or perfected], anything to prevent my being able to acquire by its means all the other perfections of the Divine nature; nor finally why the power I have of acquiring these perfections, if it really exists in me, shall not suffice to produce the ideas of them.

At the same time I recognise that this cannot be. For, in the first place, although it were true that every day my knowledge acquired new degrees of perfection, and that there were in my nature many things potentially which are not yet there actually, nevertheless these excellences do not pertain to [or make the smallest approach to] the idea which I have of God in whom there is nothing merely potential [but in whom all is present really and actually]; for it is an infallible token of imperfection in my knowledge that it increases little by little. and further, although my knowledge grows more and more, nevertheless I do not for that reason believe that it can ever be actually infinite, since it can never reach a point so high that it will be unable to attain to any greater increase. But I understand God to be actually infinite, so that He can add nothing to His supreme perfection. And finally I perceive that the objective being of an idea cannot be produced by a being that exists potentially only, which properly speaking is nothing, but only by a being which is formal or actual.

To speak the truth, I see nothing in all that I have just said which by the light of nature is not manifest to anyone

who desires to think attentively on the subject; but when I slightly relax my attention, my mind, finding its vision somewhat obscured and so to speak blinded by the images of sensible objects, I do not easily recollect the reason why the idea that I possess of a being more perfect then I, must necessarily have been placed in me by a being which is really more perfect; and this is why I wish here to go on to inquire whether I, who have this idea, can exist if no such being exists.

And I ask, from whom do I then derive my existence? Perhaps from myself or from my parents, or from some other source less perfect than God; for we can imagine nothing more perfect than God, or even as perfect as He is.

But [were I independent of every other and] were I myself the author of my being, I should doubt nothing and I should desire nothing, and finally no perfection would be lacking to me; for I should have bestowed on myself every perfection of which I possessed any idea and should thus be God. And it must not be imagined that those things that are lacking to me are perhaps more difficult of attainment than those which I already possess; for, on the contrary, it is quite evident that it was a matter of much greater difficulty to bring to pass that I, that is to say, a thing or a substance that thinks, should emerge out of nothing, than it would be to attain to the knowledge of many things of which I am ignorant, and which are only the accidents of this thinking substance. But it is clear that if I had of myself possessed this greater perfection of which I have just spoken [that is to say, if I had been the author of my own existence], I should not at least have denied myself the things which are the more easy to acquire [to wit, many branches of knowledge of which my nature is destitute]; nor should I have deprived myself of any of the things contained in the idea which I form of God, because there are none of them which seem to me specially difficult to acquire: and if there were any that were more difficult to acquire, they would certainly appear to me to be such (supposing I myself were the origin of the other things which I possess) since I should discover in them that my powers were limited.

But though I assume that perhaps I have always existed just as I am at present, neither can I escape the force of this reasoning, and imagine that the conclusion to be drawn from this is, that I need not seek for any author of my existence. For all the course of my life may be divided into an infinite number of parts, none of which is in any way dependent on the other; and thus from the fact that I was in existence a short time ago it does not follow that I must be in existence now, unless some cause at this instant, so to speak, produces me anew, that is to say, conserves me. It is as a matter of fact perfectly clear and evident to all those who consider with attention the nature of time, that, in order to be conserved in each moment in which it endures, a substance has need of the same power and action as would be necessary to produce and create it anew, supposing it did not yet exist, so that the light of nature shows us clearly that the distinction between creation and conservation is solely a distinction of the reason.

All that I thus require here is that I should interrogate myself, if I wish to know whether I possess a power which is capable of bringing it to pass that I who now am shall still be in the future; for since I am nothing but a thinking thing,

or at least since thus far it is only this portion of myself which is precisely in question at present, if such a power did reside in me, I should certainly be conscious of it. But I am conscious of nothing of the kind, and by this I know clearly that I depend on some being different from myself.

Possibly, however, this being on which I depend is not that which I call God, and I am created either by my parents or by some other cause less perfect than God. This cannot be, because, as I have just said, it is perfectly evident that there must be at least as much reality in the cause as in the effect; and thus since I am a thinking thing, and possess an idea of God within me, whatever in the end be the cause assigned to my existence, it must be allowed that it is likewise a thinking thing and that it possesses in itself the idea of all the perfections which I attribute to God. We may again inquire whether this cause derives its origin from itself or from some other thing. For if from itself, it follows by the reasons before brought forward, that this cause must itself be God; for since it possesses the virtue of self-existence, it must also without doubt have the power of actually possessing all the perfections of which it has the idea, that is, all those which I conceive as existing in God. But if it derives its existence from some other cause than itself, we shall again ask, for the same reason, whether this second cause exists by itself or through another, until from one step to another, we finally arrive at an ultimate cause, which will be God.

And it is perfectly manifest that in this there can be no regression into infinity, since what is in question is not so much the cause which formerly created me, as that which conserves me at the present time.

Nor can we suppose that several causes may have concurred in my production, and that from one I have received the idea of one of the perfections which I attribute to God, and from another the idea of some other, so that all these perfections indeed exist somewhere in the universe, but not as complete in one unity which is God. On the contrary, the unity, the simplicity or the inseparability of all things which are in god is one of the principal perfections which I conceive to be in Him. And certainly the idea of this unity of all Divine perfections cannot have been placed in me by any cause from which I have not likewise received the ideas of all the other perfections; for this cause could not make me able to comprehend them as joined together in an inseparable unity without having at the same time caused me in some measure to know what they are [and in some way to recognise each one of them].

Finally, so far as my parents [from whom it appears I have sprung] are concerned, although all that I have ever been able to believe of them were true, that does not make it follow that it is they who conserve me, nor are they even the authors of my being in any sense, in so far as I am a thinking being; since what they did was merely to implant certain dispositions in that matter in which the self¥i.e. the mind, which alone I at present identify with myself¥is by me deemed to exist. And thus there can be no difficulty in their regard, but we must of necessity conclude from the fact alone that I exist, or that the idea of a Being supremely perfect¥that is of God¥is in me, that the proof of God's existence is grounded on the highest evidence.

It only remains to me to examine into the manner in which

I have acquired this idea from God; for I have not received it through the senses, and it is never presented to me unexpectedly, as is usual with the ideas of sensible things when these things present themselves, or seem to present themselves, to the external organs of my senses; nor is it likewise a fiction of my mind, for it is not in my power to take from or to add anything to it; and consequently the only alternative is that it is innate in me, just as the idea of myself is innate in me.

And one certainly ought not to find it strange that God, in creating me, placed this idea within me to be like the mark of the workman imprinted on his work; and it is likewise not essential that the mark shall be something different from the work itself. For from the sole fact that God created me it is most probable that in some way he has placed his image and similitude upon me, and that I perceive this similitude (in which the idea of God is contained) by means of the same faculty by which I perceive myself¥that is to say, when I reflect on myself I not only know that I am something [imperfect], incomplete and dependent on another, which incessantly aspires after something which is better and greater than myself, but I also know that He on whom I depend possesses in Himself all the great things towards which I aspire [and the ideas of which I find within myself], and that not indefinitely or potentially alone, but really, actually and infinitely; and that thus He is God. And the whole strength of the argument which I have here made use of to prove the existence of God consists in this, that I recognise that it is not possible that my nature should be what it is, and indeed that I should have in myself the idea of a God, if God did not veritably exist¥a God, I say, whose idea is in me, i.e. who possesses all those supreme perfections of which our mind may indeed have some idea but without understanding them all, who is liable to no errors or defect [and who has none of all those marks which denote imperfection]. From this it is manifest that He cannot be a deceiver, since the light of nature teaches us that fraud and deception necessarily proceed from some defect.

But before I examine this matter with more care, and pass on to the consideration of other truths which may be derived from it, it seems to me right to pause for a while in order to contemplate God Himself, to ponder at leisure His marvellous attributes, to consider, and admire, and adore, the beauty of this light so resplendent, at least as far as the strength of my mind, which is in some measure dazzled by the sight, will allow me to do so. For just as faith teaches us that the supreme felicity of the other life consists only in this contemplation of the Divine Majesty, so we continue to learn by experience that a similar meditation, though incomparably less perfect, causes us to enjoy the greatest satisfaction of which we are capable in this life.

Meditation IV.

Of the True and the False.

I have been well accustomed these past days to detach my mind from my senses, and I have accurately observed that there are very few things that one knows with certainty respecting corporeal objects, that there are many more which are known to us respecting the human mind, and yet more still regarding God

Himself; so that I shall now without any difficulty abstract my thoughts from the consideration of [sensible or] imaginable objects, and carry them to those which, being withdrawn from all contact with matter, are purely intelligible. And certainly the idea which I possess of the human mind inasmuch as it is a thinking thing, and not extended in length, width and depth, nor participating in anything pertaining to body, is incomparably more distinct than is the idea of any corporeal thing. And when I consider that I doubt, that is to say, that I am an incomplete and dependent being, the idea of a being that is complete and independent, that is of God, presents itself to my mind with so much distinctness and clearness¥and from the fact alone that this idea is found in me, or that I who possess this idea exist, I conclude so certainly that God exists, and that my existence depends entirely on Him in every moment of my life¥that I do not think that the human mind is capable of knowing anything with more evidence and certitude. And it seems to me that I now have before me a road which will lead us from the contemplation of the true God (in whom all the treasures of science and wisdom are contained) to the knowledge of the other objects of the universe.

For, first of all, I recognise it to be impossible that He should ever deceive me; for in all fraud and deception some imperfection is to be found, and although it may appear that the power of deception is a mark of subtilty or power, yet the desire to deceive without doubt testifies to malice or feebleness, and accordingly cannot be found in God.

In the next place I experienced in myself a certain capacity for judging which I have doubtless received from God, like all the other things that I possess; and as He could not desire to deceive me, it is clear that He has not given me a faculty that will lead me to err if I use it aright.

And no doubt respecting this matter could remain, if it were not that the consequence would seem to follow that I can thus never be deceived; for if I hold all that I possess from God, and if He has not placed in me the capacity for error, it seems as though I could never fall into error. And it is true that when I think only of God [and direct my mind wholly to Him],18 I discover [in myself] no cause of error, or falsity; yet directly afterwards, when recurring to myself, experience shows me that I am nevertheless subject to an infinitude of errors, as to which, when we come to investigate them more closely, I notice that not only is there a real and positive idea of God or of a Being of supreme perfection present to my mind, but also, so to speak, a certain negative idea of nothing, that is, of that which is infinitely removed from any kind of perfection; and that I am in a sense something intermediate between God and nought, i.e. placed in such a manner between the supreme Being and non-being, that there is in truth nothing in me that can lead to error in so far as a sovereign Being has formed me; but that, as I in some degree participate likewise in nought or in non-being, i.e. in so far as I am not myself the supreme Being, and as I find myself subject to an infinitude of imperfections, I ought not to be astonished if I should fall into error. Thus do I recognise that error, in so far as it is such, is not a real thing depending on God, but simply a defect; and therefore, in order to fall into it, that I have no need to possess a special faculty given me by God for this very purpose, but that I fall into error from the fact that the power given me by God for

the purpose of distinguishing truth from error is not infinite.

Nevertheless this does not quite satisfy me; for error is not a pure negation [i.e. is not the dimple defect or want of some perfection which ought not to be mine], but it is a lack of some knowledge which it seems that I ought to possess. And on considering the nature of God it does not appear to me possible that He should have given me a faculty which is not perfect of its kind, that is, which is wanting in some perfection due to it. For if it is true that the more skilful the artizan, the more perfect is the work of his hands, what can have been produced by this supreme Creator of all things that is not in all its parts perfect? And certainly there is no doubt that God could have created me so that I could never have been subject to error; it is also certain that He ever wills what is best; is it then better that I should be subject to err than that I should not?

In considering this more attentively, it occurs to me in the first place that I should not be astonished if my intelligence is not capable of comprehending why God acts as He does; and that there is thus no reason to doubt of His existence from the fact that I may perhaps find many other things besides this as to which I am able to understand neither for what reason nor how God has produced them. For, in the first place, knowing that my nature is extremely feeble and limited, and that the nature of God is on the contrary immense, incomprehensible, and infinite, I have no further difficulty in recognising that there is an infinitude of matter in His power, the causes of which transcend my knowledge; and this reason suffices to convince me that the species of cause termed final, finds no useful employment in physical [or natural] things; for it does not appear to me that I can without temerity seek to investigate the [inscrutable] ends of God.

It further occurs to me that we should not consider one single creature separately, when we inquire as to whether the works of God are perfect, but should regard all his creations together. For the same thing which might possibly seem very imperfect with some semblance of reason if regarded by itself, is found to be very perfect if regarded as part of the whole universe; and although, since I resolved to doubt all things, I as yet have only known certainly my own existence and that of God, nevertheless since I have recognised the infinite power of God, I cannot deny that He may have produced many other things, or at least that He has the power of producing them, so that I may obtain a place as a part of a great universe.

Whereupon, regarding myself more closely, and considering what are my errors (for they alone testify to there being any imperfection in me), I answer that they depend on a combination of two causes, to wit, on the faculty of knowledge that rests in me, and on the power of choice or of free will¥that is to say, of the understanding and at the same time of the will. For by the understanding alone I [neither assert nor deny anything, but] apprehend19 the ideas of things as to which I can form a judgment. But no error is properly speaking found in it, provided the word error is taken in its proper signification; and though there is possibly an infinitude of things in the world of which I have no idea in my understanding, we cannot for all that say that it is deprived of these ideas [as we might say of something which is

required by its nature], but simply it does not possess these; because in truth there is no reason to prove that God should have given me a greater faculty of knowledge than He has given me; and however skillful a workman I represent Him to be, I should not for all that consider that He was bound to have placed in each of His works all the perfections which He may have been able to place in some. I likewise cannot complain that God has not given me a free choice or a will which is sufficient, ample and perfect, since as a matter of fact I am conscious of a will so extended as to be subject to no limits. And what seems to me very remarkable in this regard is that of all the qualities which I possess there is no one so perfect and so comprehensive that I do not very clearly recognise that it might be yet greater and more perfect. For, to take an example, if I consider the faculty of comprehension which I possess, I find that it is of very small extent and extremely limited, and at the same time I find the idea of another faculty much more ample and even infinite, and seeing that I can form the idea of it, I recognise from this very fact that it pertains to the nature of God. If in the same way I examine the memory, the imagination, or some other faculty, I do not find any which is not small and circumscribed, while in God it is immense [or infinite]. It is free-will alone or liberty of choice which I find to be so great in me that I can conceive no other idea to be more great; it is indeed the case that it is for the most part this will that causes me to know that in some manner I bear the image and similitude of God. For although the power of will is incomparably greater in God than in me, both by reason of the knowledge and the power which, conjoined with it, render it stronger and more efficacious, and by reason of its object, inasmuch as in God it extends to a great many things; it nevertheless does not seem to me greater if I consider it formally and precisely in itself: for the faculty of will consists alone in our having the power of choosing to do a thing or choosing not to do it (that is, to affirm or deny, to pursue or to shun it), or rather it consists alone in the fact that in order to affirm or deny, pursue or shun those things placed before us by the understanding, we act so that we are unconscious that any outside force constrains us in doing so. For in order that I should be free it is not necessary that I should be indifferent as to the choice of one or the other of two contraries; but contrariwise the more I lean to the one¥whether I recognise clearly that the reasons of the good and true are to be found in it, or whether God so disposes my inward thought¥the more freely do I choose and embrace it. And undoubtedly both divine grace and natural knowledge, far from diminishing my liberty, rather increase it and strengthen it. Hence this indifference which I feel, when I am not swayed to one side rather than to the other by lack of reason, is the lowest grade of liberty, and rather evinces a lack or negation in knowledge than a perfection of will: for if I always recognised clearly what was true and good, I should never have trouble in deliberating as to what judgment or choice I should make, and then I should be entirely free without ever being indifferent.

From all this I recognise that the power of will which I have received from God is not of itself the source of my errors¥for it is very ample and very perfect of its kind¥any more than is the power of understanding; for since I understand nothing but by the power which God has given me for

understanding, there is no doubt that all that I understand, I understand as I ought, and it is not possible that I err in this. Whence then come my errors? They come from the sole fact that since the will is much wider in its range and compass than the understanding, I do not restrain it within the same bounds, but extend it also to things which I do not understand: and as the will is of itself indifferent to these, it easily falls into error and sin, and chooses the evil for the good, or the false for the true.

For example, when I lately examined whether anything existed in the world, and found that from the very fact that I considered this question it followed very clearly that I myself existed, I could not prevent myself from believing that a thing I so clearly conceived was true: not that I found myself compelled to do so by some external cause, but simply because from great clearness in my mind there followed a great inclination of my will; and I believed this with so much the greater freedom or spontaneity as I possessed the less indifference towards it. Now, on the contrary, I not only know that I exist, inasmuch as I am a thinking thing, but a certain representation of corporeal nature is also presented to my mind; and it comes to pass that I doubt whether this thinking nature which is in me, or rather by which I am what I am, differs from this corporeal nature, or whether both are not simply the same thing; and I here suppose that I do not yet know any reason to persuade me to adopt the one belief rather than the other. From this it follows that I am entirely indifferent as to which of the two I affirm or deny, or even whether I abstain from forming any judgment in the matter.

And this indifference does not only extend to matters as to which the understanding has no knowledge, but also in general to all those which are not apprehended with perfect clearness at the moment when the will is deliberating upon them: for, however probable are the conjectures which render me disposed to form a judgment respecting anything, the simple knowledge that I have that those are conjectures alone and not certain and indubitable reasons, suffices to occasion me to judge the contrary. Of this I have had great experience of late when I set aside as false all that I had formerly held to be absolutely true, for the sole reason that I remarked that it might in some measure be doubted.

But if I abstain from giving my judgment on any thing when I do not perceive it with sufficient clearness and distinctness, it is plain that I act rightly and am not deceived. But if I determine to deny or affirm, I no longer make use as I should of my free will, and if I affirm what is not true, it is evident that I deceive myself; even though I judge according to truth, this comes about only by chance, and I do not escape the blame of misusing my freedom; for the light of nature teaches us that the knowledge of the understanding should always precede the determination of the will. And it is in the misuse of the free will that the privation which constitutes the characteristic nature of error is met with. Privation, I say, is found in the act, in so far as it proceeds from me, but it is not found in the faculty which I have received from God, nor even in the act in so far as it depends on Him.

For I have certainly no cause to complain that God has not given me an intelligence which is more powerful, or a natural light which is stronger than that which I have

received from Him, since it is proper to the finite understanding not to comprehend a multitude of things, and it is proper to a created understanding to be finite; on the contrary, I have every reason to render thanks to God who owes me nothing and who has given me all the perfections I possess, and I should be far from charging Him with injustice, and with having deprived me of, or wrongfully withheld from me, these perfections which He has not bestowed upon me.

I have further no reason to complain that He has given me a will more ample than my understanding, for since the will consists only of one single element, and is so to speak indivisible, it appears that its nature is such that nothing can be abstracted from it [without destroying it]; and certainly the more comprehensive it is found to be, the more reason I have to render gratitude to the giver.

And, finally, I must also not complain that God concurs with me in forming the acts of the will, that is the judgment in which I go astray, because these acts are entirely true and good, inasmuch as they depend on God; and in a certain sense more perfection accrues to my nature from the fact that I can form them, than if I could not do so. As to the privation in which alone the formal reason of error or sin consists, it has no need of any concurrence from God, since it is not a thing [or an existence], and since it is not related to God as to a cause, but should be termed merely a negation [according to the significance given to these words in the Schools]. For in fact it is not an imperfection in God that He has given me the liberty to give or withhold my assent from certain things as to which He has not placed a clear and distinct knowledge in my understanding; but it is without doubt an imperfection in me not to make a good use of my freedom, and to give my judgment readily on matters which I only understand obscurely. I nevertheless perceive that God could easily have created me so that I never should err, although I still remained free, and endowed with a limited knowledge, viz. by giving to my understanding a clear and distinct intelligence of all things as to which I should ever have to deliberate; or simply by His engraving deeply in my memory the resolution never to form a judgment on anything without having a clear and distinct understanding of it, so that I could never forget it. And it is easy for me to understand that, in so far as I consider myself alone, and as if there were only myself in the world, I should have been much more perfect than I am, if God had created me so that I could never err. Nevertheless I cannot deny that in some sense it is a greater perfection in the whole universe that certain parts should not be exempt from error as others are than that all parts should be exactly similar. And I have no right to complain if God, having placed me in the world, has not called upon me to play a part that excels all others in distinction and perfection.

And further I have reason to be glad on the ground that if He has not given me the power of never going astray by the first means pointed out above, which depends on a clear and evident knowledge of all the things regarding which I can deliberate, He has at least left within my power the other means, which is firmly to adhere to the resolution never to give judgment on matters whose truth is not clearly known to me; for although I notice a certain weakness in my nature in that I cannot continually concentrate my mind on one single thought, I can yet, by attentive and frequently repeated meditation, impress it so forcibly on my memory that I shall

never fail to recollect it whenever I have need of it, and thus acquire the habit of never going astray.

And inasmuch as it is in this that the greatest and principal perfection of man consists, it seems to me that I have not gained little by this day's Meditation, since I have discovered the source of falsity and error. And certainly there can be no other source than that which I have explained; for as often as I so restrain my will within the limits of my knowledge that it forms no judgment except on matters which are clearly and distinctly represented to it by the understanding, I can never be deceived; for every clear and distinct conception20 is without doubt something, and hence cannot derive its origin from what is nought, but must of necessity have God as its author¥God, I say, who being supremely perfect, cannot be the cause of any error; and consequently we must conclude that such a conception [or such a judgment] is true. Nor have I only learned to-day what I should avoid in order that I may not err, but also how I should act in order to arrive at a knowledge of the truth; for without doubt I shall arrive at this end if I devote my attention sufficiently to those things which I perfectly understand; and if I separate from these that which I only understand confusedly and with obscurity. To these I shall henceforth diligently give heed.

Meditation V.

Of the essence of material things, and, again, of God, that He exists.

Many other matters respecting the attributes of God and my own nature or mind remain for consideration; but I shall possibly on another occasion resume the investigation of these. Now (after first noting what must be done or avoided, in order to arrive at a knowledge of the truth) my principal task is to endeavour to emerge from the state of doubt into which I have these last days fallen, and to see whether nothing certain can be known regarding material things.

But before examining whether any such objects as I conceive exist outside of me, I must consider the ideas of them in so far as they are in my thought, and see which of them are distinct and which confused.

In the first place, I am able distinctly to imagine that quantity which philosophers commonly call continuous, or the extension in length, breadth, or depth, that is in this quantity, or rather in the object to which it is attributed. Further, I can number in it many different parts, and attribute to each of its parts many sorts of size, figure, situation and local movement, and, finally, I can assign to each of these movements all degrees of duration.

And not only do I know these things with distinctness when I consider them in general, but, likewise [however little I apply my attention to the matter], I discover an infinitude of particulars respecting numbers, figures, movements, and other such things, whose truth is so manifest, and so well accords with my nature, that when I begin to discover them, it seems to me that I learn nothing new, or recollect what I formerly knew¥that is to say, that I for the first time perceive things which were already present to my mind, although I had not as yet applied my mind to them.

And what I here find to be most important is that I

discover in myself an infinitude of ideas of certain things which cannot be esteemed as pure negations, although they may possibly have no existence outside of my thought, and which are not framed by me, although it is within my power either to think or not to think them, but which possess natures which are true and immutable. For example, when I imagine a triangle, although there may nowhere in the world be such a figure outside my thought, or ever have been, there is nevertheless in this figure a certain determinate nature, form, or essence, which is immutable and eternal, which I have not invented, and which in no wise depends on my mind, as appears from the fact that diverse properties of that triangle can be demonstrated, viz. that its three angles are equal to two right angles, that the greatest side is subtended by the greatest angle, and the like, which now, whether I wish it or do not wish it, I recognise very clearly as pertaining to it, although I never thought of the matter at all when I imagined a triangle for the first time, and which therefore cannot be said to have been invented by me.

Nor does the objection hold good that possibly this idea of a triangle has reached my mind through the medium of my senses, since I have sometimes seen bodies triangular in shape; because I can form in my mind an infinitude of other figures regarding which we cannot have the least conception of their ever having been objects of sense, and I can nevertheless demonstrate various properties pertaining to their nature as well as to that of the triangle, and these must certainly all be true since I conceive them clearly. Hence they are something, and not pure negation; for it is perfectly clear that all that is true is something, and I have already fully demonstrated that all that I know clearly is true. And even although I had not demonstrated this, the nature of my mind is such that I could not prevent myself from holding them to be true so long as I conceive them clearly; and I recollect that even when I was still strongly attached to the objects of sense, I counted as the most certain those truths which I conceived clearly as regards figures, numbers, and the other matters which pertain to arithmetic and geometry, and, in general, to pure and abstract mathematics.

But now, if just because I can draw the idea of something from my thought, it follows that all which I know clearly and distinctly as pertaining to this object does really belong to it, may I not derive from this an argument demonstrating the existence of God? It is certain that I no less find the idea of God, that is to say, the idea of a supremely perfect Being, in me, than that of any figure or number whatever it is; and I do not know any less clearly and distinctly that an [actual and] eternal existence pertains to this nature than I know that all that which I am able to demonstrate of some figure or number truly pertains to the nature of this figure or number, and therefore, although all that I concluded in the preceding Meditations were found to be false, the existence of God would pass with me as at least as certain as I have ever held the truths of mathematics (which concern only numbers and figures) to be.

This indeed is not at first manifest, since it would seem to present some appearance of being a sophism. For being accustomed in all other things to make a distinction between existence and essence, I easily persuade myself that the existence can be separated from the essence of God, and that we can thus conceive God as not actually existing. But,

nevertheless, when I think of it with more attention, I clearly see that existence can no more be separated from the essence of God than can its having its three angles equal to two right angles be separated from the essence of a [rectilinear] triangle, or the idea of a mountain from the idea of a valley; and so there is not any less repugnance to our conceiving a God (that is, a Being supremely perfect) to whom existence is lacking (that is to say, to whom a certain perfection is lacking), than to conceive of a mountain which has no valley.

But although I cannot really conceive of a God without existence any more than a mountain without a valley, still from the fact that I conceive of a mountain with a valley, it does not follow that there is such a mountain in the world; similarly although I conceive of God as possessing existence, it would seem that it does not follow that there is a God which exists; for my thought does not impose any necessity upon things, and just as I may imagine a winged horse, although no horse with wings exists, so I could perhaps attribute existence to God, although no God existed.

But a sophism is concealed in this objection; for from the fact that I cannot conceive a mountain without a valley, it does not follow that there is any mountain or any valley in existence, but only that the mountain and the valley, whether they exist or do not exist, cannot in any way be separated one from the other. While from the fact that I cannot conceive God without existence, it follows that existence is inseparable from Him, and hence that He really exists; not that my thought can bring this to pass, or impose any necessity on things, but, on the contrary, because the necessity which lies in the thing itself, i.e. the necessity of the existence of God determines me to think in this way. For it is not within my power to think of God without existence (that is of a supremely perfect Being devoid of a supreme perfection) though it is in my power to imagine a horse either with wings or without wings.

And we must not here object that it is in truth necessary for me to assert that God exists after having presupposed that He possesses every sort of perfection, since existence is one of these, but that as a matter of fact my original supposition was not necessary, just as it is not necessary to consider that all quadrilateral figures can be inscribed in the circle; for supposing I thought this, I should be constrained to admit that the rhombus might be inscribed in the circle since it is a quadrilateral figure, which, however, is manifestly false. [We must not, I say, make any such allegations because] although it is not necessary that I should at any time entertain the notion of God, nevertheless whenever it happens that I think of a first and a sovereign Being, and, so to speak, derive the idea of Him from the storehouse of my mind, it is necessary that I should attribute to Him every sort of perfection, although I do not get so far as to enumerate them all, or to apply my mind to each one in particular. And this necessity suffices to make me conclude (after having recognised that existence is a perfection) that this first and sovereign Being really exists; just as though it is not necessary for me ever to imagine any triangle, yet, whenever I wish to consider a rectilinear figure composed only of three angles, it is absolutely essential that I should attribute to it all those properties which serve to bring about the conclusion that its three angles are not greater than two

right angles, even although I may not then be considering this point in particular. But when I consider which figures are capable of being inscribed in the circle, it is in no wise necessary that I should think that all quadrilateral figures are of this number; on the contrary, I cannot even pretend that this is the case, so long as I do not desire to accept anything which I cannot conceive clearly and distinctly. And in consequence there is a great difference between the false suppositions such as this, and the true ideas born within me, the first and principal of which is that of God. For really I discern in many ways that this idea is not something factitious, and depending solely on my thought, but that it is the image of a true and immutable nature; first of all, because I cannot conceive anything but God himself to whose essence existence [necessarily] pertains; in the second place because it is not possible for me to conceive two or more Gods in this same position; and, granted that there is one such God who now exists, I see clearly that it is necessary that He should have existed from all eternity, and that He must exist eternally; and finally, because I know an infinitude of other properties in God, none of which I can either diminish or change.

For the rest, whatever proof or argument I avail myself of, we must always return to the point that it is only those things which we conceive clearly and distinctly that have the power of persuading me entirely. And although amongst the matters which I conceive of in this way, some indeed are manifestly obvious to all, while others only manifest themselves to those who consider them closely and examine them attentively; still, after they have once been discovered, the latter are not esteemed as any less certain than the former. For example, in the case of every right-angled triangle, although it does not so manifestly appear that the square of the base is equal to the squares of the two other sides as that this base is opposite to the greatest angle; still, when this has once been apprehended, we are just as certain of its truth as of the truth of the other. And as regards God, if my mind were not pre-occupied with prejudices, and if my thought did not find itself on all hands diverted by the continual pressure of sensible things, there would be nothing which I could know more immediately and more easily than Him. For is there anything more manifest than that there is a God, that is to say, a Supreme Being, to whose essence alone existence pertains?21

And although for a firm grasp of this truth I have need of a strenuous application of mind, at present I not only feel myself to be as assured of it as of all that I hold as most certain, but I also remark that the certainty of all other things depends on it so absolutely, that without this knowledge it is impossible ever to know anything perfectly.

For although I am of such a nature that as long as22 I understand anything very clearly and distinctly, I am naturally impelled to believe it to be true, yet because I am also of such a nature that I cannot have my mind constantly fixed on the same object in order to perceive it clearly, and as I often recollect having formed a past judgment without at the same time properly recollecting the reasons that led me to make it, it may happen meanwhile that other reasons present themselves to me, which would easily cause me to change my opinion, if I were ignorant of the facts of the existence of God, and thus I should have no true and certain knowledge, but

only vague and vacillating opinions. Thus, for example, when I consider the nature of a [rectilinear] triangle, I who have some little knowledge of the principles of geometry recognise quite clearly that the three angles are equal to two right angles, and it is not possible for me not to believe this so long as I apply my mind to its demonstration; but so soon as I abstain from attending to the proof, although I still recollect having clearly comprehended it, it may easily occur that I come to doubt its truth, if I am ignorant of there being a God. For I can persuade myself of having been so constituted by nature that I can easily deceive myself even in those matters which I believe myself to apprehend with the greatest evidence and certainty, especially when I recollect that I have frequently judged matters to be true and certain which other reasons have afterwards impelled me to judge to be altogether false.

But after I have recognised that there is a God¥because at the same time I have also recognised that all things depend upon Him, and that He is not a deceiver, and from that have inferred that what I perceive clearly and distinctly cannot fail to be true¥although I no longer pay attention to the reasons for which I have judged this to be true, provided that I recollect having clearly and distinctly perceived it no contrary reason can be brought forward which could ever cause me to doubt of its truth; and thus I have a true and certain knowledge of it. And this same knowledge extends likewise to all other things which I recollect having formerly demonstrated, such as the truths of geometry and the like; for what can be alleged against them to cause me to place them in doubt? Will it be said that my nature is such as to cause me to be frequently deceived? But I already know that I cannot be deceived in the judgment whose grounds I know clearly. Will it be said that I formerly held many things to be true and certain which I have afterwards recognised to be false? But I had not had any clear and distinct knowledge of these things, and not as yet knowing the rule whereby I assure myself of the truth, I had been impelled to give my assent from reasons which I have since recognised to be less strong than I had at the time imagined them to be. What further objection can then be raised? That possibly I am dreaming (an objection I myself made a little while ago), or that all the thoughts which I now have are no more true than the phantasies of my dreams? But even though I slept the case would be the same, for all that is clearly present to my mind is absolutely true.

And so I very clearly recognise that the certainty and truth of all knowledge depends alone on the knowledge of the true God, in so much that, before I knew Him, I could not have a perfect knowledge of any other thing. And now that I know Him I have the means of acquiring a perfect knowledge of an infinitude of things, not only of those which relate to God Himself and other intellectual matters, but also of those which pertain to corporeal nature in so far as it is the object of pure mathematics [which have no concern with whether it exists or not].

Meditation VI.

Of the Existence of Material Things, and of the real distinction between the Soul and Body of Man.

Nothing further now remains but to inquire whether material things exist. And certainly I at least know that these may exist in so far as they are considered as the objects of pure mathematics, since in this aspect I perceive them clearly and distinctly. For there is no doubt that God possesses the power to produce everything that I am capable of perceiving with distinctness, and I have never deemed that anything was impossible for Him, unless I found a contradiction in attempting to conceive it clearly. Further, the faculty of imagination which I possess, and of which, experience tells me, I make use when I apply myself to the consideration of material things, is capable of persuading me of their existence; for when I attentively consider what imagination is, I find that it is nothing but a certain application of the faculty of knowledge to the body which is immediately present to it, and which therefore exists.

And to render this quite clear, I remark in the first place the difference that exists between the imagination and pure intellection [or conception23]. For example, when I imagine a triangle, I do not conceive it only as a figure comprehended by three lines, but I also apprehend24 these three lines as present by the power and inward vision of my mind,25 and this is what I call imagining. But if I desire to think of a chiliagon, I certainly conceive truly that it is a figure composed of a thousand sides, just as easily as I conceive of a triangle that it is a figure of three sides only; but I cannot in any way imagine the thousand sides of a chiliagon [as I do the three sides of a triangle], nor do I, so to speak, regard them as present [with the eyes of my mind]. And although in accordance with the habit I have formed of always employing the aid of my imagination when I think of corporeal things, it may happen that in imagining a chiliagon I confusedly represent to myself some figure, yet it is very evident that this figure is not a chiliagon, since it in no way differs from that which I represent to myself when I think of a myriagon or any other many-sided figure; nor does it serve my purpose in discovering the properties which go to form the distinction between a chiliagon and other polygons. But if the question turns upon a pentagon, it is quite true that I can conceive its figure as well as that of a chiliagon without the help of my imagination; but I can also imagine it by applying the attention of my mind to each of its five sides, and at the same time to the space which they enclose. And thus I clearly recognise that I have need of a particular effort of mind in order to effect the act of imagination, such as I do not require in order to understand, and this particular effort of mind clearly manifests the difference which exists between imagination and pure intellection.26

I remark besides that this power of imagination which is in one, inasmuch as it differs from the power of understanding, is in no wise a necessary element in my nature, or in [my essence, that is to say, in] the essence of my mind; for although I did not possess it I should doubtless ever remain the same as I now am, from which it appears that we might conclude that it depends on something which differs from me. And I easily conceive that if some body exists with which my mind is conjoined and united in such a way that it can apply itself to consider it when it pleases, it may be that by this means it can imagine corporeal objects; so that this mode of thinking differs from pure intellection only inasmuch as mind in its intellectual activity in some manner turns on

itself, and considers some of the ideas which it possesses in itself; while in imagining it turns towards the body, and there beholds in it something conformable to the idea which it has either conceived of itself or perceived by the senses. I easily understand, I say, that the imagination could be thus constituted if it is true that body exists; and because I can discover no other convenient mode of explaining it, I conjecture with probability that body does exist; but this is only with probability, and although I examine all things with care, I nevertheless do not find that from this distinct idea of corporeal nature, which I have in my imagination, I can derive any argument from which there will necessarily be deduced the existence of body.

But I am in the habit of imagining many other things besides this corporeal nature which is the object of pure mathematics, to wit, the colours, sounds, scents, pain, and other such things, although less distinctly. And inasmuch as I perceive these things much better through the senses, by the medium of which, and by the memory, they seem to have reached my imagination, I believe that, in order to examine them more conveniently, it is right that I should at the same time investigate the nature of sense perception, and that I should see if from the ideas which I apprehend by this mode of thought, which I call feeling, I cannot derive some certain proof of the existence of corporeal objects.

And first of all I shall recall to my memory those matters which I hitherto held to be true, as having perceived them through the senses, and the foundations on which my belief has rested; in the next place I shall examine the reasons which have since obliged me to place them in doubt; in the last place I shall consider which of them I must now believe.

First of all, then, I perceived that I had a head, hands, feet, and all other members of which this body¥which I considered as a part, or possibly even as the whole, of myself¥is composed. Further I was sensible that this body was placed amidst many others, from which it was capable of being affected in many different ways, beneficial and hurtful, and I remarked that a certain feeling of pleasure accompanied those that were beneficial, and pain those which were harmful. And in addition to this pleasure and pain, I also experienced hunger, thirst, and other similar appetites, as also certain corporeal inclinations towards joy, sadness, anger, and other similar passions. And outside myself, in addition to extension, figure, and motions of bodies, I remarked in them hardness, heat, and all other tactice qualities, and, further, light and colour, and scents and sounds, the variety of which gave me the means of distinguishing the sky, the earth, the sea, and generally all the other bodies, one from the other. And certainly, considering the ideas of all these qualities which presented themselves to my mind, and which alone I perceived properly or immediately, it was not without reason that I believed myself to perceive objects quite different from my thought, to wit, bodies from which those ideas proceeded; for I found by experience that these ideas presented themselves to me without my consent being requisite, so that I could not perceive any object, however desirous I might be, unless it were present to the organs of sense; and it was not in my power not to perceive it, when it was present. And because the ideas which I received through the senses were much more lively, more clear, and even, in their

own way, more distinct than any of those which I could of myself frame in meditation, or than those I found impressed on my memory, it appeared as though they could not have proceeded from my mind, so that they must necessarily have been produced in me by some other things. And having no knowledge of those objects excepting the knowledge which the ideas themselves gave me, nothing was more likely to occur to my mind than that the objects were similar to the ideas which were caused. And because I likewise remembered that I had formerly made use of my senses rather than my reason, and recognised that the ideas which I formed of myself were not so distinct as those which I perceived through the senses, and that they were most frequently even composed of portions of these last, I persuaded myself easily that I had no idea in my mind which had not formerly come to me through the senses. Nor was it without some reason that I believed that this body (which be a certain special right I call my own) belonged to me more properly and more strictly than any other; for in fact I could never be separated from it as from other bodies; I experienced in it and on account of it all my appetites and affections, and finally I was touched by the feeling of pain and the titillation of pleasure in its parts, and not in the parts of other bodies which were separated from it. But when I inquired, why, from some, I know not what, painful sensation, there follows sadness of mind, and from the pleasurable sensation there arises joy, or why this mysterious pinching of the stomach which I call hunger causes me to desire to eat, and dryness of throat causes a desire to drink, and so on, I could give no reason excepting that nature taught me so; for there is certainly no affinity (that I at least can understand) between the craving of the stomach and the desire to eat, any more than between the perception of whatever causes pain and the thought of sadness which arises from this perception. And in the same way it appeared to me that I had learned from nature all the other judgments which I formed regarding the objects of my senses, since I remarked that these judgments were formed in me before I had the leisure to weigh and consider any reasons which might oblige me to make them.

But afterwards many experiences little by little destroyed all the faith which I had rested in my senses; for I from time to time observed that those towers which from afar appeared to me to be round, more closely observed seemed square, and that colossal statues raised on the summit of these towers, appeared as quite tiny statues when viewed from the bottom; and so in an infinitude of other cases I found error in judgments founded on the external senses. And not only in those founded on the external senses, but even in those founded on the internal as well; for is there anything more intimate or more internal than pain? And yet I have learned from some persons whose arms or legs have been cut off, that they sometimes seemed to feel pain in the part which had been amputated, which made me think that I could not be quite certain that it was a certain member which pained me, even although I felt pain in it. And to those grounds of doubt I have lately added two others, which are very general; the first is that I never have believed myself to feel anything in waking moments which I cannot also sometimes believe myself to feel when I sleep, and as I do not think that these things which I seem to feel in sleep, proceed from objects outside of me, I do not see any reason why I should

have this belief regarding objects which I seem to perceive while awake. The other was that being still ignorant, or rather supposing myself to be ignorant, of the author of my being, I saw nothing to prevent me from having been so constituted by nature that I might be deceived even in matters which seemed to me to be most certain. And as to the grounds on which I was formerly persuaded of the truth of sensible objects, I had not much trouble in replying to them. For since nature seemed to cause me to lean towards many things from which reason repelled me, I did not believe that I should trust much to the teachings of nature. And although the ideas which I receive by the senses do not depend on my will, I did not think that one should for that reason conclude that they proceeded from things different from myself, since possibly some faculty might be discovered in me¥though hitherto unknown to me¥which produced them.

But now that I begin to know myself better, and to discover more clearly the author of my being, I do not in truth think that I should rashly admit all the matters which the senses seem to teach us, but, on the other hand, I do not think that I should doubt them all universally.

And first of all, because I know that all things which I apprehend clearly and distinctly can be created by God as I apprehend them, it suffices that I am able to apprehend one thing apart from another clearly and distinctly in order to be certain that the one is different from the other, since they may be made to exist in separation at least by the omnipotence of God; and it does not signify by what power this separation is made in order to compel me to judge them to be different: and, therefore, just because I know certainly that I exist, and that meanwhile I do not remark that any other thing necessarily pertains to my nature or essence, excepting that I am a thinking thing, I rightly conclude that my essence consists solely in the fact that I am a thinking thin [or a substance whose whole essence or nature is to think]. And although possibly (or rather certainly, as I shall say in a moment) I possess a body with which I am very intimately conjoined, yet because, on the one side, I have a clear and distinct idea of myself inasmuch as I am only a thinking and unextended thing, and as, on the other, I possess a distinct idea of body, inasmuch as it is only an extended and unthinking thing, it is certain that this I [that is to say, my soul by which I am what I am], is entirely and absolutely distinct from my body, and can exist without it.

I further find in myself faculties imploying modes of thinking peculiar to themselves, to wit, the faculties of imagination and feeling, without which I can easily conceive myself clearly and distinctly as a complete being; while, on the other hand, they cannot be so conceived apart from me, that is without an intelligent substance in which they reside, for [in the notion we have of these faculties, or, to use the language of the Schools] in their formal concept, some kind of intellection is comprised, from which I infer that they are distinct from me as its modes are from a thing. I observe also in me some other faculties such as that of change of position, the assumption of different figures and such like, which cannot be conceived, any more than can the preceding, apart from some substance to which they are attached, and consequently cannot exist without it; but it is very clear that these faculties, if it be true that they exist, must be attached to some corporeal or extended substance, and not to

an intelligent substance, since in the clear and distinct conception of these there is some sort of extension found to be present, but no intellection at all. There is certainly further in me a certain passive faculty of perception, that is, of receiving and recognising the ideas of sensible things, but this would be useless to me [and I could in no way avail myself of it], if there were not either in me or in some other thing another active faculty capable of forming and producing these ideas. But this active faculty cannot exist in me [inasmuch as I am a thing that thinks] seeing that it does not presuppose thought, and also that those ideas are often produced in me without my contributing in any way to the same, and often even against my will; it is thus necessarily the case that the faculty resides in some substance different from me in which all the reality which is objectively in the ideas that are produced by this faculty is formally or eminently contained, as I remarked before. And this substance is either a body, that is, a corporeal nature in which there is contained formally [and really] all that which is objectively [and by representation] in those ideas, or it is God Himself, or some other creature more noble than body in which that same is contained eminently. But, since God is no deceiver, it is very manifest that He does not communicate to me these ideas immediately and by Himself, nor yet by the intervention of some creature in which their reality is not formally, but only eminently, contained. For since He has given me no faculty to recognise that this is the case, but, on the other hand, a very great inclination to believe [that they are sent to me or] that they are conveyed to me by corporeal objects, I do not see how He could be defended from the accusation of deceit if these ideas were produced by causes other than corporeal objects. Hence we must allow that corporeal things exist. However, they are perhaps not exactly what we perceive by the senses, since this comprehension by the senses is in many instances very obscure and confused; but we must at least admit that all things which I conceive in them clearly and distinctly, that is to say, all things which, speaking generally, are comprehended in the object of pure mathematics, are truly to be recognised as external objects.

As to other things, however, which are either particular only, as, for example, that the sun is of such and such a figure, etc., or which are less clearly and distinctly conceived, such as light, sound, pain and the like, it is certain that although they are very dubious and uncertain, yet on the sole ground that God is not a deceiver, and that consequently He has not permitted any falsity to exist in my opinion which He has not likewise given me the faculty of correcting, I may assuredly hope to conclude that I have within me the means of arriving at the truth even here. And first of all there is no doubt that in all things which nature teaches me there is some truth contained; for by nature, considered in general, I now understand no other thing than either God Himself or else the order and disposition which God has established in created things; and by my nature in particular I understand no other thing than the complexus of all the things which God has given me.

But there is nothing which this nature teaches me more expressly [nor more sensibly] than that I have a body which is adversely affected when I feel pain, which has need of food or drink when I experience the feelings of hunger and thirst, and so on; nor can I doubt there being some truth in all this.

Nature also teaches me by these sensations of pain, hunger, thirst, etc., that I am not only lodged in my body as a pilot in a vessel, but that I am not only lodged in my body as a pilot in a vessel, but that I am very closely united to it, and so to speak so intermingled with it that I seem to compose with it one whole. For if that were not the case, when my body is hurt, I, who am merely a thinking thing, should not feel pain, for I should perceive this wound by the understanding only, just as the sailor perceives by sight when something is damaged in his vessel; and when my body has need of drink or food, I should clearly understand the fact without being warned of it by confused feelings of hunger and thirst. For all these sensations of hunger, thirst, pain, etc. are in truth none other than certain confused modes of thought which are produced by the union and apparent intermingling of mind and body.

Moreover, nature teaches me that many other bodies exist around mine, of which some are to be avoided, and others sought after. And certainly from the fact that I am sensible of different sorts of colours, sounds, scents, tastes, heat, hardness, etc., I very easily conclude that there are in the bodies from which all these diverse sense-perceptions proceed certain variations which answer to them, although possibly these are not really at all similar to them. And also from the fact that amongst these different sense-perceptions some are very agreeable to me and others disagreeable, it is quite certain that my body (or rather myself in my entirety, inasmuch as I am formed of body and soul) may receive different impressions agreeable and disagreeable from the other bodies which surround it.

But there are many other things which nature seems to have taught me, but which at the same time I have never really received from her, but which have been brought about in my mind by a certain habit which I have of forming inconsiderate judgments on things; and thus it may easily happen that these judgments contain some error. Take, for example, the opinion which I hold that all space in which there is nothing that affects [or makes an impression on] my senses is void; that in a body which is warm there is something entirely similar to the idea of heat which is in me; that in a white or green body there is the same whiteness or greenness that I perceive; that in a bitter or sweet body there is the same taste, and so on in other instances; that the stars, the towers, and all other distant bodies are of the same figure and size as they appear from far off to our eyes, etc. But in order that in this there should be nothing which I do not conceive distinctly, I should define exactly what I really understand when I say that I am taught somewhat by nature. For here I take nature in a more limited signification than when I term it the sum of all the things given me by God, since in this sum many things are comprehended which only pertain to mind (and to these I do not refer in speaking of nature) such as the notion which I have of the fact that what has once been done cannot ever be undone and an infinitude of such things which I know by the light of nature [without the help of the body]; and seeing that it comprehends many other matters besides which only pertain to body, and are no longer here contained under the name of nature, such as the quality of weight which it possesses and the like, with which I also do not deal; for in talking of nature I only treat of those things given by God to me as a being composed of mind and body. But the nature here

described truly teaches me to flee from things which cause the sensation of pain, and seek after the things which communicate to me the sentiment of pleasure and so forth; but I do not see that beyond this it teaches me that from those diverse sense-perceptions we should ever form any conclusion regarding things outside of us, without having [carefully and maturely] mentally examined them beforehand. For it seems to me that it is mind alone, and not mind and body in conjunction, that is requisite to a knowledge of the truth in regard to such things. Thus, although a star makes no larger an impression on my eye than the flame of a little candle there is yet in me no real or positive propensity impelling me to believe that it is not greater than that flame; but I have judged it to be so from my earliest years, without any rational foundation. And although in approaching fire I feel heat, and in approaching it a little too near I even feel pain, there is at the same time no reason in this which could persuade me that there is in the fire something resembling this heat any more than there is in it something resembling the pain; all that I have any reason to believe from this is, that there is something in it, whatever it may be, which excites in me these sensations of heat or of pain. So also, although there are spaces in which I find nothing which excites my senses, I must not from that conclude that these spaces contain no body; for I see in this, as in other similar things, that I have been in the habit of perverting the order of nature, because these perceptions of sense having bee placed within me by nature merely for the purpose of signifying to my mind what things are beneficial or hurtful to the composite whole of which it forms a part, and being up to that point sufficiently clear and distinct, I yet avail myself of them as though they were absolute rules by which I might immediately determine the essence of the bodies which are outside me, as to which, in fact, they can teach me nothing but what is most obscure and confused.

But I have already sufficiently considered how, notwithstanding the supreme goodness of God, falsity enters into the judgments I make. Only here a new difficulty is presented¥one respecting those things the pursuit or avoidance of which is taught me by nature, and also respecting the internal sensations which I possess, and in which I seem to have sometimes detected error [and thus to be directly deceived by my own nature]. To take an example, the agreeable taste of some food in which poison has been intermingled may induce me to partake of the poison, and thus deceive me. It is true, at the same time, that in this case nature may be excused, for it only induces me to desire food in which I find a pleasant taste, and not to desire the poison which is unknown to it; and thus I can infer nothing from this fact, except that my nature is not omniscient, at which there is certainly no reason to be astonished, since man, being finite in nature, can only have knowledge the perfectness of which is limited.

But we not unfrequently deceive ourselves even in those things to which we are directly impelled by nature, as happens with those who when they are sick desire to drink or eat things hurtful to them. It will perhaps be said here that the cause of their deceptiveness is that their nature is corrupt, but that does not remove the difficulty, because a sick man is none the less truly God's creature than he who is in health; and it is therefore as repugnant to God's goodness for the one to have a deceitful nature as it is for the other. And as a

clock composed of wheels and counter-weights no less exactly observes the laws of nature when it is badly made, and does not show the time properly, than when it entirely satisfies the wishes of its maker, and as, if I consider the body of a man as being a sort of machine so built up and composed of nerves, muscles, veins, blood and skin, that though there were no mind in it at all, it would not cease to have the same motions as at present, exception being made of those movements which are due to the direction of the will, and in consequence depend upon the mind [as apposed to those which operate by the disposition of its organs], I easily recognise that it would be as natural to this body, supposing it to be, for example, dropsical, to suffer the parchedness of the throat which usually signifies to the mind the feeling of thirst, and to be disposed by this parched feeling to move the nerves and other parts in the way requisite for drinking, and thus to augment its malady and do harm to itself, as it is natural to it, when it has no indisposition, to be impelled to drink for its good by a similar cause. And although, considering the use to which the clock has been destined by its maker, I may say that it deflects from the order of its nature when it does not indicate the hours correctly; and as, in the same way, considering the machine of the human body as having been formed by God in order to have in itself all the movements usually manifested there, I have reason for thinking that it does not follow the order of nature when, if the throat is dry, drinking does harm to the conservation of health, nevertheless I recognise at the same time that this last mode of explaining nature is very different from the other. For this is but a purely verbal characterisation depending entirely on my thought, which compares a sick man and a badly constructed clock with the idea which I have of a healthy man and a well made clock, and it is hence extrinsic to the things to which it is applied; but according to the other interpretation of the term nature I understand something which is truly found in things and which is therefore not without some truth.

But certainly although in regard to the dropsical body it is only so to speak to apply an extrinsic term when we say that its nature is corrupted, inasmuch as apart from the need to drink, the throat is parched; yet in regard to the composite whole, that is to say, to the mind or soul united to this body, it is not a purely verbal predicate, but a real error of nature, for it to have thirst when drinking would be hurtful to it. And thus it still remains to inquire how the goodness of God does not prevent the nature of man so regarded from being fallacious.

In order to begin this examination, then, I here say, in the first place, that there is a great difference between mind and body, inasmuch as body is by nature always divisible, and the mind is entirely indivisible. For, as a matter of fact, when I consider the mind, that is to say, myself inasmuch as I am only a thinking thing, I cannot distinguish in myself any parts, but apprehend myself to be clearly one and entire; and although the whole mind seems to be united to the whole body, yet if a foot, or an arm, or some other part, is separated from my body, I am aware that nothing has been taken away from my mind. And the faculties of willing, feeling, conceiving, etc. cannot be properly speaking said to be its parts, for it is one and the same mind which employs itself in willing and in feeling and understanding. But it is quite otherwise with

corporeal or extended objects, for there is not one of these imaginable by me which my mind cannot easily divide into parts, and which consequently I do not recognise as being divisible; this would be sufficient to teach me that the mind or soul of man is entirely different from the body, if I had not already learned it from other sources.

I further notice that the mind does not receive the impressions from all parts of the body immediately, but only from the brain, or perhaps even from one of its smallest parts, to wit, from that in which the common sense27 is said to reside, which, whenever it is disposed in the same particular way, conveys the same thing to the mind, although meanwhile the other portions of the body may be differently disposed, as is testified by innumerable experiments which it is unnecessary here to recount.

I notice, also, that the nature of body is such that none of its parts can be moved by another part a little way off which cannot also be moved in the same way by each one of the parts which are between the two, although this more remote part does not act at all. As, for example, in the cord ABCD [which is in tension] if we pull the last part D, the first part A will not be moved in any way differently from what would be the case if one of the intervening parts B or C were pulled, and the last part D were to remain unmoved. And in the same way, when I feel pain in my foot, my knowledge of physics teaches me that this sensation is communicated by means of nerves dispersed through the foot, which, being extended like cords from there to the brain, when they are contracted in the foot, at the same time contract the inmost portions of the brain which is their extremity and place of origin, and then excite a certain movement which nature has established in order to cause the mind to be affected by a sensation of pain represented as existing in the foot. But because these nerves must pass through the tibia, the thigh, the loins, the back and the neck, in order to reach from the leg to the brain, it may happen that although their extremities which are in the foot are not affected, but only certain ones of their intervening parts [which pass by the loins or the neck], this action will excite the same movement in the brain that might have been excited there by a hurt received in the foot, in consequence of which the mind will necessarily feel in the foot the same pain as if it had received a hurt. And the same holds good of all the other perceptions of our senses.

I notice finally that since each of the movements which are in the portion of the brain by which the mind is immediately affected brings about one particular sensation only, we cannot under the circumstances imagine anything more likely than that this movement, amongst all the sensations which it is capable of impressing on it, causes mind to be affected by that one which is best fitted and most generally useful for the conservation of the human body when it is in health. But experience makes us aware that all the feelings with which nature inspires us are such as I have just spoken of; and there is therefore nothing in them which does not give testimony to the power and goodness of the God [who has produced them28]. Thus, for example, when the nerves which are in the feet are violently or more than usually moved, their movement, passing through the medulla of the spine29 to the inmost parts of the brain, gives a sign to the mind which makes it feel somewhat, to wit, pain, as though in the foot,

by which the mind is excited to do its utmost to remove the cause of the evil as dangerous and hurtful to the foot. It is true that God could have constituted the nature of man in such a way that this same movement in the brain would have conveyed something quite different to the mind; for example, it might have produced consciousness of itself either in so far as it is in the brain, or as it is in the foot, or as it is in some other place between the foot and the brain, or it might finally have produced consciousness of anything else whatsoever; but none of all this would have contributed so well to the conservation of the body. Similarly, when we desire to drink, a certain dryness of the throat is produced which moves its nerves, and by their means the internal portions of the brain; and this movement causes in the mind the sensation of thirst, because in this case there is nothing more useful to us than to become aware that we have need to drink for the conservation o our health; and the same holds good in other instances.

From this it is quite clear that, notwithstanding the supreme goodness of God, the nature of man, inasmuch as it is composed of mind and body, cannot be otherwise than sometimes a source of deception. For if there is any cause which excites, not in the foot but in some part of the nerves which are extended between the foot and the brain, or even in the brain itself, the same movement which usually is produced when the foot is detrimentally affected, pain will be experienced as though it were in the foot, and the sense will thus naturally be deceived; for since the same movement in the brain is capable of causing but one sensation in the mind, and this sensation is much more frequently excited by a cause which hurts the foot than by another existing in some other quarter, it is reasonable that it should convey to the mind pain in the foot rather than in any other part of the body. And although the parchedness of the throat does not always proceed, as it usually does, from the fact that drinking is necessary for the health of the body, but sometimes comes from quite a different cause, as is the case with dropsical patients, it is yet much better that it should mislead on this occasion than if, on the other hand, it were always to deceive us when the body is in good health; and so on in similar cases.

And certainly this consideration is of great service to me, not only in enabling me to recognise all the errors to which my nature is subject, but also in enabling me to avoid them or to correct them more easily. for knowing that all my senses more frequently indicate to me truth than falsehood respecting the things which concern that which is beneficial to the body, and being able almost always to avail myself of many of them in order to examine one particular thing, and, besides that, being able to make use of my memory in order to connect the present with the past, and of my understanding which already has discovered all the causes of my errors, I ought no longer to fear that falsity may be found in matters every day presented to me by my senses. And I ought to set aside all the doubts of these past days as hyperbolical and ridiculous, particularly that very common uncertainty respecting sleep, which I could not distinguish from the waking state; for at present I find a very notable difference between the two, inasmuch as our memory can never connect our dreams one with the other, or with the whole course of our lives, as it unites events which happen to us while we are

awake. And, as a matter of fact, if someone, while I was awake, quite suddenly appeared to me and disappeared as fast as do the images which I see in sleep, so that I could not know from whence the form came nor whither it went, it would not be without reason that I should deem it a spectre or a phantom formed by my brain [and similar to those which I form in sleep], rather than a real man. But when I perceive things as to which I know distinctly both the place from which they proceed, and that in which they are, and the time at which they appeared to me; and when, without any interruption, I can connect the perceptions which I have of them with the whole course of my life, I am perfectly assured that these perceptions occur while I am waking and not during sleep. And I ought in no wise to doubt the truth of such matters, if, after having called up all my senses, my memory, and my understanding, to examine them, nothing is brought to evidence by any one of them which is repugnant to what is set forth by the others. For because God is in no wise a deceiver, it follows that I am not deceived in this. But because the exigencies of action often oblige us to make up our minds before having leisure to examine matters carefully, we must confess that the life of man is very frequently subject to error in respect to individual objects, and we must in the end acknowledge the infirmity of our nature.

2For convenience sake the "Objections and Replies" are published in the second volume of this edition.
3The French version is followed here.
4The French version is followed here.
5When it is thought desirable to insert additional readings from the French version this will be indicated by the use of square brackets.
6Between the Praefatio ad Lectorem and the Synopsis, the Paris Edition (1st Edition) interpolates an Index which is not found in the Amsterdam Edition (2nd Edition). Since Descartes did not reproduce it, he was doubtless not its author. Mersenne probably composed it himself, adjusting it to the paging of the first Edition. (Note in Adam and Tannery's Edition.)
7intellectio.
8imaginatio.
9In place of this long title at the head of the page the first Edition had immediately after the Synopsis, and on the same page 7, simply "First Meditation." (Adam's Edition.)

The Enchiridion, or Manual

Epictetus
c. 135 CE.

 This text file is based on and adapted from Elizabeth Carter's 1758 English translation of the *Enchiridion*. This is a working draft; please report errors.[1]

The Enchiridion

1. Some things are in our control and others not. Things in our control are opinion, pursuit, desire, aversion, and, in a word, whatever are our own actions. Things not in our control are body, property, reputation, command, and, in one word, whatever are not our own actions.

The things in our control are by nature free, unrestrained, unhindered; but those not in our control are weak, slavish, restrained, belonging to others. Remember, then, that if you suppose that things which are slavish by nature are also free, and that what belongs to others is your own, then you will be hindered. You will lament, you will be disturbed, and you will find fault both with gods and men. But if you suppose that only to be your own which is your own, and what belongs to others such as it really is, then no one will ever compel you or restrain you. Further, you will find fault with no one or accuse no one. You will do nothing against your will. No one will hurt you, you will have no enemies, and you not be harmed.

Aiming therefore at such great things, remember that you must not allow yourself to be carried, even with a slight tendency, towards the attainment of lesser things. Instead, you must entirely quit some things and for the present postpone the rest. But if you would both have these great things, along with power and riches, then you will not gain even the latter, because you aim at the former too: but you will absolutely fail of the former, by which alone happiness and freedom are achieved.

Work, therefore to be able to say to every harsh appearance, "You are but an appearance, and not absolutely the thing you appear to be." And then examine it by those rules which you have, and first, and chiefly, by this: whether it concerns the things which are in our own control, or those which are not; and, if it concerns anything not in our control, be prepared to say that it is nothing to you.

2. Remember that following desire promises the attainment of that of which you are desirous; and aversion promises the avoiding that to which you are averse. However, he who fails to obtain the object of his desire is disappointed, and he who incurs the object of his aversion wretched. If, then, you confine your aversion to those objects only which are contrary to the natural use of your faculties, which you have in your own control, you will never incur anything to which you are

averse. But if you are averse to sickness, or death, or poverty, you will be wretched. Remove aversion, then, from all things that are not in our control, and transfer it to things contrary to the nature of what is in our control. But, for the present, totally suppress desire: for, if you desire any of the things which are not in your own control, you must necessarily be disappointed; and of those which are, and which it would be laudable to desire, nothing is yet in your possession. Use only the appropriate actions of pursuit and avoidance; and even these lightly, and with gentleness and reservation.

3. With regard to whatever objects give you delight, are useful, or are deeply loved, remember to tell yourself of what general nature they are, beginning from the most insignificant things. If, for example, you are fond of a specific ceramic cup, remind yourself that it is only ceramic cups in general of which you are fond. Then, if it breaks, you will not be disturbed. If you kiss your child, or your wife, say that you only kiss things which are human, and thus you will not be disturbed if either of them dies.

4. When you are going about any action, remind yourself what nature the action is. If you are going to bathe, picture to yourself the things which usually happen in the bath: some people splash the water, some push, some use abusive language, and others steal. Thus you will more safely go about this action if you say to yourself, "I will now go bathe, and keep my own mind in a state conformable to nature." And in the same manner with regard to every other action. For thus, if any hindrance arises in bathing, you will have it ready to say, "It was not only to bathe that I desired, but to keep my mind in a state conformable to nature; and I will not keep it if I am bothered at things that happen.

5. Men are disturbed, not by things, but by the principles and notions which they form concerning things. Death, for instance, is not terrible, else it would have appeared so to Socrates. But the terror consists in our notion of death that it is terrible. When therefore we are hindered, or disturbed, or grieved, let us never attribute it to others, but to ourselves; that is, to our own principles. An uninstructed person will lay the fault of his own bad condition upon others. Someone just starting instruction will lay the fault on himself. Some who is perfectly instructed will place blame neither on others nor on himself.

6. Don't be prideful with any excellence that is not your own. If a horse should be prideful and say, " I am handsome," it would be supportable. But when you are prideful, and say, " I have a handsome horse," know that you are proud of what is, in fact, only the good of the horse. What, then, is your own? Only your reaction to the appearances of things. Thus, when you behave conformably to nature in reaction to how things appear, you will be proud with reason; for you will take pride in some good of your own.

7. Consider when, on a voyage, your ship is anchored; if you go on shore to get water you may along the way amuse yourself with picking up a shellish, or an onion. However, your thoughts and continual attention ought to be bent towards the ship, waiting for the captain to call on board; you must then immediately leave all these things, otherwise you will be thrown into the ship, bound neck and feet like a sheep. So it is with life. If, instead of an onion or a shellfish, you are given a wife or child, that is fine. But if the captain calls, you must run to the ship, leaving them, and regarding none of them. But if you are old, never go far from the ship: lest, when you are called, you should be unable to come in time.

8. Don't demand that things happen as you wish, but wish that they happen as they do happen, and you will go on well.

9. Sickness is a hindrance to the body, but not to your ability to choose, unless that is your choice. Lameness is a hindrance to the leg, but not to your ability to choose. Say this to yourself with regard to everything that happens, then you will see such obstacles as hindrances to something else, but not to yourself.

10. With every accident, ask yourself what abilities you have for making a proper use of it. If you see an attractive person, you will find that self-restraint is the ability you have against your desire. If you are in pain, you will find fortitude. If you hear unpleasant language, you will find patience. And thus habituated, the appearances of things will not hurry you away along with them.

11. Never say of anything, "I have lost it"; but, "I have returned it." Is your child dead? It is returned. Is your wife dead? She is returned. Is your estate taken away? Well, and is not that likewise returned? "But he who took it away is a bad man." What difference is it to you who the giver assigns to take it back? While he gives it to you to possess, take care of it; but don't view it as your own, just as travelers view a hotel.

12. If you want to improve, reject such reasonings as these: "If I neglect my affairs, I'll have no income; if I don't correct my servant, he will be bad." For it is better to die with hunger, exempt from grief and fear, than to live in affluence with perturbation; and it is better your servant should be bad, than you unhappy.

Begin therefore from little things. Is a little oil spilt? A little wine stolen? Say to yourself, "This is the price paid for apathy, for tranquillity, and nothing is to be had for nothing." When you call your servant, it is possible that he may not come; or, if he does, he may not do what you want. But he is by no means of such importance that it should be in his power to give you any disturbance.

13. If you want to improve, be content to be thought foolish and stupid with regard to external things. Don't wish to be thought to know anything; and even if you appear to be somebody important to others, distrust yourself. For, it is difficult to both keep your faculty of choice in a state conformable to nature, and at the same time acquire external things. But while you are careful about the one, you must of necessity neglect the other.

14. If you wish your children, and your wife, and your friends to live for ever, you are stupid; for you wish to be in control of things which you cannot, you wish for things that belong to others to be your own. So likewise, if you wish your servant to be without fault, you are a fool; for you wish vice not to be vice," but something else. But, if you wish to have your desires undisappointed, this is in your own control. Exercise, therefore, what is in your control. He is the master of every other person who is able to confer or remove whatever that person wishes either to have or to avoid. Whoever, then, would be free, let him wish nothing, let him decline nothing, which depends on others else he must necessarily be a slave.

15. Remember that you must behave in life as at a dinner party. Is anything brought around to you? Put out your hand and take your share with moderation. Does it pass by you? Don't stop it. Is it not yet come? Don't stretch your desire towards it, but wait till it reaches you. Do this with regard to children, to a wife, to public posts, to riches, and you will eventually be a worthy partner of the feasts of the gods. And if you don't even take the things which are set before you, but are able even to reject them, then you will not only be a partner at the feasts of the gods, but also of their empire. For, by doing this, Diogenes, Heraclitus and others like them, deservedly became, and were called, divine.

16. When you see anyone weeping in grief because his son has gone abroad, or is dead, or because he has suffered in his affairs, be careful that the appearance may not misdirect you. Instead,

distinguish within your own mind, and be prepared to say, "It's not the accident that distresses this person., because it doesn't distress another person; it is the judgment which he makes about it." As far as words go, however, don't reduce yourself to his level, and certainly do not moan with him. Do not moan inwardly either.

17. Remember that you are an actor in a drama, of such a kind as the author pleases to make it. If short, of a short one; if long, of a long one. If it is his pleasure you should act a poor man, a cripple, a governor, or a private person, see that you act it naturally. For this is your business, to act well the character assigned you; to choose it is another's.

18. When a raven happens to croak unluckily, don't allow the appearance hurry you away with it, but immediately make the distinction to yourself, and say, "None of these things are foretold to me; but either to my paltry body, or property, or reputation, or children, or wife. But to me all omens are lucky, if I will. For whichever of these things happens, it is in my control to derive advantage from it."

19. You may be unconquerable, if you enter into no combat in which it is not in your own control to conquer. When, therefore, you see anyone eminent in honors, or power, or in high esteem on any other account, take heed not to be hurried away with the appearance, and to pronounce him happy; for, if the essence of good consists in things in our own control, there will be no room for envy or emulation. But, for your part, don't wish to be a general, or a senator, or a consul, but to be free; and the only way to this is a contempt of things not in our own control.

20. Remember, that not he who gives ill language or a blow insults, but the principle which represents these things as insulting. When, therefore, anyone provokes you, be assured that it is your own opinion which provokes you. Try, therefore, in the first place, not to be hurried away with the appearance. For if you once gain time and respite, you will more easily command yourself.

21. Let death and exile, and all other things which appear terrible be daily before your eyes, but chiefly death, and you win never entertain any abject thought, nor too eagerly covet anything.

22. If you have an earnest desire of attaining to philosophy, prepare yourself from the very first to be laughed at, to be sneered by the multitude, to hear them say,." He is returned to us a philosopher all at once," and " Whence this supercilious look?" Now, for your part, don't have a supercilious look indeed; but keep steadily to those things which appear best to you as one appointed by God to this station. For remember that, if you adhere to the same point, those very persons who at first ridiculed will afterwards admire you. But if you are conquered by them, you will incur a double ridicule.

23. If you ever happen to turn your attention to externals, so as to wish to please anyone, be assured that you have ruined your scheme of life. Be contented, then, in everything with being a philosopher; and, if you wish to be thought so likewise by anyone, appear so to yourself, and it will suffice you.

24. Don't allow such considerations as these distress you. "I will live in dishonor, and be nobody anywhere." For, if dishonor is an evil, you can no more be involved in any evil by the means of another, than be engaged in anything base. Is it any business of yours, then, to get power, or to be admitted to an entertainment? By no means. How, then, after all, is this a dishonor? And how is it true that you will be nobody anywhere, when you ought to be somebody in those things only which are in your own control, in which you may be of the greatest consequence? "But my friends will be unassisted." -- What do you mean by unassisted? They will not have money from you, nor will you make them Roman citizens. Who told you, then, that these are among the things in our own

control, and not the affair of others? And who can give to another the things which he has not himself? "Well, but get them, then, that we too may have a share." If I can get them with the preservation of my own honor and fidelity and greatness of mind, show me the way and I will get them; but if you require me to lose my own proper good that you may gain what is not good, consider how inequitable and foolish you are. Besides, which would you rather have, a sum of money, or a friend of fidelity and honor? Rather assist me, then, to gain this character than require me to do those things by which I may lose it. Well, but my country, say you, as far as depends on me, will be unassisted. Here again, what assistance is this you mean? "It will not have porticoes nor baths of your providing." And what signifies that? Why, neither does a smith provide it with shoes, or a shoemaker with arms. It is enough if everyone fully performs his own proper business. And were you to supply it with another citizen of honor and fidelity, would not he be of use to it? Yes. Therefore neither are you yourself useless to it. "What place, then, say you, will I hold in the state?" Whatever you can hold with the preservation of your fidelity and honor. But if, by desiring to be useful to that, you lose these, of what use can you be to your country when you are become faithless and void of shame.

25. Is anyone preferred before you at an entertainment, or in a compliment, or in being admitted to a consultation? If these things are good, you ought to be glad that he has gotten them; and if they are evil, don't be grieved that you have not gotten them. And remember that you cannot, without using the same means [which others do] to acquire things not in our own control, expect to be thought worthy of an equal share of them. For how can he who does not frequent the door of any [great] man, does not attend him, does not praise him, have an equal share with him who does? You are unjust, then, and insatiable, if you are unwilling to pay the price for which these things are sold, and would have them for nothing. For how much is lettuce sold? Fifty cents, for instance. If another, then, paying fifty cents, takes the lettuce, and you, not paying it, go without them, don't imagine that he has gained any advantage over you. For as he has the lettuce, so you have the fifty cents which you did not give. So, in the present case, you have not been invited to such a person's entertainment, because you have not paid him the price for which a supper is sold. It is sold for praise; it is sold for attendance. Give him then the value, if it is for your advantage. But if you would, at the same time, not pay the one and yet receive the other, you are insatiable, and a blockhead. Have you nothing, then, instead of the supper? Yes, indeed, you have: the not praising him, whom you don't like to praise; the not bearing with his behavior at coming in.

26. The will of nature may be learned from those things in which we don't distinguish from each other. For example, when our neighbor's boy breaks a cup, or the like, we are presently ready to say, "These things will happen." Be assured, then, that when your own cup likewise is broken, you ought to be affected just as when another's cup was broken. Apply this in like manner to greater things. Is the child or wife of another dead? There is no one who would not say, "This is a human accident." but if anyone's own child happens to die, it is presently, "Alas I how wretched am I!" But it should be remembered how we are affected in hearing the same thing concerning others.

27. As a mark is not set up for the sake of missing the aim, so neither does the nature of evil exist in the world.

28. If a person gave your body to any stranger he met on his way, you would certainly be angry. And do you feel no shame in handing over your own mind to be confused and mystified by anyone who happens to verbally attack you?

29. In every affair consider what precedes and follows, and then undertake it. Otherwise you will

begin with spirit; but not having thought of the consequences, when some of them appear you will shamefully desist. "I would conquer at the Olympic games." But consider what precedes and follows, and then, if it is for your advantage, engage in the affair. You must conform to rules, submit to a diet, refrain from dainties; exercise your body, whether you choose it or not, at a stated hour, in heat and cold; you must drink no cold water, nor sometimes even wine. In a word, you must give yourself up to your master, as to a physician. Then, in the combat, you may be thrown into a ditch, dislocate your arm, turn your ankle, swallow dust, be whipped, and, after all, lose the victory. When you have evaluated all this, if your inclination still holds, then go to war. Otherwise, take notice, you will behave like children who sometimes play like wrestlers, sometimes gladiators, sometimes blow a trumpet, and sometimes act a tragedy when they have seen and admired these shows. Thus you too will be at one time a wrestler, at another a gladiator, now a philosopher, then an orator; but with your whole soul, nothing at all. Like an ape, you mimic all you see, and one thing after another is sure to please you, but is out of favor as soon as it becomes familiar. For you have never entered upon anything considerately, nor after having viewed the whole matter on all sides, or made any scrutiny into it, but rashly, and with a cold inclination. Thus some, when they have seen a philosopher and heard a man speaking like Euphrates (though, indeed, who can speak like him?), have a mind to be philosophers too. Consider first, man, what the matter is, and what your own nature is able to bear. If you would be a wrestler, consider your shoulders, your back, your thighs; for different persons are made for different things. Do you think that you can act as you do, and be a philosopher? That you can eat and drink, and be angry and discontented as you are now? You must watch, you must labor, you must get the better of certain appetites, must quit your acquaintance, be despised by your servant, be laughed at by those you meet; come off worse than others in everything, in magistracies, in honors, in courts of judicature. When you have considered all these things round, approach, if you please; if, by parting with them, you have a mind to purchase apathy, freedom, and tranquillity. If not, don't come here; don't, like children, be one while a philosopher, then a publican, then an orator, and then one of Caesar's officers. These things are not consistent. You must be one man, either good or bad. You must cultivate either your own ruling faculty or externals, and apply yourself either to things within or without you; that is, be either a philosopher, or one of the vulgar.

30. Duties are universally measured by relations. Is anyone a father? If so, it is implied that the children should take care of him, submit to him in everything, patiently listen to his reproaches, his correction. But he is a bad father. Is you naturally entitled, then, to a good father? No, only to a father. Is a brother unjust? Well, keep your own situation towards him. Consider not what he does, but what you are to do to keep your own faculty of choice in a state conformable to nature. For another will not hurt you unless you please. You will then be hurt when you think you are hurt. In this manner, therefore, you will find, from the idea of a neighbor, a citizen, a general, the corresponding duties if you accustom yourself to contemplate the several relations.

31. Be assured that the essential property of piety towards the gods is to form right opinions concerning them, as existing "I and as governing the universe with goodness and justice. And fix yourself in this resolution, to obey them, and yield to them, and willingly follow them in all events, as produced by the most perfect understanding. For thus you will never find fault with the gods, nor accuse them as neglecting you. And it is not possible for this to be effected any other way than by withdrawing yourself from things not in our own control, and placing good or evil in those only which are. For if you suppose any of the things not in our own control to be either good or evil, when you are disappointed of what you wish, or incur what you would avoid, you must necessarily

find fault with and blame the authors. For every animal is naturally formed to fly and abhor things that appear hurtful, and the causes of them; and to pursue and admire those which appear beneficial, and the causes of them. It is impractical, then, that one who supposes himself to be hurt should be happy about the person who, he thinks, hurts him, just as it is impossible to be happy about the hurt itself. Hence, also, a father is reviled by a son, when he does not impart to him the things which he takes to be good; and the supposing empire to be a good made Polynices and Eteocles mutually enemies. On this account the husbandman, the sailor, the merchant, on this account those who lose wives and children, revile the gods. For where interest is, there too is piety placed. So that, whoever is careful to regulate his desires and aversions as he ought, is, by the very same means, careful of piety likewise. But it is also incumbent on everyone to offer libations and sacrifices and first fruits, conformably to the customs of his country, with purity, and not in a slovenly manner, nor negligently, nor sparingly, nor beyond his ability.

32. When you have recourse to divination, remember that you know not what the event will be, and you come to learn it of the diviner; but of what nature it is you know before you come, at least if you are a philosopher. For if it is among the things not in our own control, it can by no means be either good or evil. Don't, therefore, bring either desire or aversion with you to the diviner (else you will approach him trembling), but first acquire a distinct knowledge that every event is indifferent and nothing to you., of whatever sort it may be, for it will be in your power to make a right use of it, and this no one can hinder; then come with confidence to the gods, as your counselors, and afterwards, when any counsel is given you, remember what counselors you have assumed, and whose advice you will neglect if you disobey. Come to divination, as Socrates prescribed, in cases of which the whole consideration relates to the event, and in which no opportunities are afforded by reason, or any other art, to discover the thing proposed to be learned. When, therefore, it is our duty to share the danger of a friend or of our country, we ought not to consult the oracle whether we will share it with them or not. For, though the diviner should forewarn you that the victims are unfavorable, this means no more than that either death or mutilation or exile is portended. But we have reason within us, and it directs, even with these hazards, to the greater diviner, the Pythian god, who cast out of the temple the person who gave no assistance to his friend while another was murdering him.

33. Immediately prescribe some character and form of conduce to yourself, which you may keep both alone and in company.

Be for the most part silent, or speak merely what is necessary, and in few words. We may, however, enter, though sparingly, into discourse sometimes when occasion calls for it, but not on any of the common subjects, of gladiators, or horse races, or athletic champions, or feasts, the vulgar topics of conversation; but principally not of men, so as either to blame, or praise, or make comparisons. If you are able, then, by your own conversation bring over that of your company to proper subjects; but, if you happen to be taken among strangers, be silent.

Don't allow your laughter be much, nor on many occasions, nor profuse.

Avoid swearing, if possible, altogether; if not, as far as you are able.

Avoid public and vulgar entertainments; but, if ever an occasion calls you to them, keep your attention upon the stretch, that you may not imperceptibly slide into vulgar manners. For be assured that if a person be ever so sound himself, yet, if his companion be infected, he who converses with him will be infected likewise.

Provide things relating to the body no further than mere use; as meat, drink, clothing, house,

family. But strike off and reject everything relating to show and delicacy.

As far as possible, before marriage, keep yourself pure from familiarities with women, and, if you indulge them, let it be lawfully." But don't therefore be troublesome and full of reproofs to those who use these liberties, nor frequently boast that you yourself don't.

If anyone tells you that such a person speaks ill of you, don't make excuses about what is said of you, but answer: " He does not know my other faults, else he would not have mentioned only these."

It is not necessary for you to appear often at public spectacles; but if ever there is a proper occasion for you to be there, don't appear more solicitous for anyone than for yourself; that is, wish things to be only just as they are, and him only to conquer who is the conqueror, for thus you will meet with no hindrance. But abstain entirely from declamations and derision and violent emotions. And when you come away, don't discourse a great deal on what has passed, and what does not contribute to your own amendment. For it would appear by such discourse that you were immoderately struck with the show.

Go not [of your own accord] to the rehearsals of any [authors], nor appear [at them] readily. But, if you do appear, keep your gravity and sedateness, and at the same time avoid being morose.

When you are going to confer with anyone, and particularly of those in a superior station, represent to yourself how Socrates or Zeno would behave in such a case, and you will not be at a loss to make a proper use of whatever may occur.

When you are going to any of the people in power, represent to yourself that you will not find him at home; that you will not be admitted; that the doors will not be opened to you; that he will take no notice of you. If, with all this, it is your duty to go, bear what happens, and never say [to yourself], " It was not worth so much." For this is vulgar, and like a man dazed by external things.

In parties of conversation, avoid a frequent and excessive mention of your own actions and dangers. For, however agreeable it may be to yourself to mention the risks you have run, it is not equally agreeable to others to hear your adventures. Avoid, likewise, an endeavor to excite laughter. For this is a slippery point, which may throw you into vulgar manners, and, besides, may be apt to lessen you in the esteem of your acquaintance. Approaches to indecent discourse are likewise dangerous. Whenever, therefore, anything of this sort happens, if there be a proper opportunity, rebuke him who makes advances that way; or, at least, by silence and blushing and a forbidding look, show yourself to be displeased by such talk.

34. If you are struck by the appearance of any promised pleasure, guard yourself against being hurried away by it; but let the affair wait your leisure, and procure yourself some delay. Then bring to your mind both points of time: that in which you will enjoy the pleasure, and that in which you will repent and reproach yourself after you have enjoyed it; and set before you, in opposition to these, how you will be glad and applaud yourself if you abstain. And even though it should appear to you a seasonable gratification, take heed that its enticing, and agreeable and attractive force may not subdue you; but set in opposition to this how much better it is to be conscious of having gained so great a victory.

35. When you do anything from a clear judgment that it ought to be done, never shun the being seen to do it, even though the world should make a wrong supposition about it; for, if you don't act right, shun the action itself; but, if you do, why are you afraid of those who censure you wrongly?

36. As the proposition, "Either it is day or it is night," is extremely proper for a disjunctive

argument, but quite improper in a conjunctive one, so, at a feast, to choose the largest share is very suitable to the bodily appetite, but utterly inconsistent with the social spirit of an entertainment. When you eat with another, then, remember not only the value of those things which are set before you to the body, but the value of that behavior which ought to be observed towards the person who gives the entertainment.

37. If you have assumed any character above your strength, you have both made an ill figure in that and quitted one which you might have supported.

38. When walking, you are careful not to step on a nail or turn your foot; so likewise be careful not to hurt the ruling faculty of your mind. And, if we were to guard against this in every action, we should undertake the action with the greater safety.

39. The body is to everyone the measure of the possessions proper for it, just as the foot is of the shoe. If, therefore, you stop at this, you will keep the measure; but if you move beyond it, you must necessarily be carried forward, as down a cliff; as in the case of a shoe, if you go beyond its fitness to the foot, it comes first to be gilded, then purple, and then studded with jewels. For to that which once exceeds a due measure, there is no bound.

40. Women from fourteen years old are flattered with the title of "mistresses" by the men. Therefore, perceiving that they are regarded only as qualified to give the men pleasure, they begin to adorn themselves, and in that to place ill their hopes. We should, therefore, fix our attention on making them sensible that they are valued for the appearance of decent, modest and discreet behavior.

41. It is a mark of want of genius to spend much time in things relating to the body, as to be long in our exercises, in eating and drinking, and in the discharge of other animal functions. These should be done incidentally and slightly, and our whole attention be engaged in the care of the understanding.

42. When any person harms you, or speaks badly of you, remember that he acts or speaks from a supposition of its being his duty. Now, it is not possible that he should follow what appears right to you, but what appears so to himself. Therefore, if he judges from a wrong appearance, he is the person hurt, since he too is the person deceived. For if anyone should suppose a true proposition to be false, the proposition is not hurt, but he who is deceived about it. Setting out, then, from these principles, you will meekly bear a person who reviles you, for you will say upon every occasion, "It seemed so to him."

43. Everything has two handles, the one by which it may be carried, the other by which it cannot. If your brother acts unjustly, don't lay hold on the action by the handle of his injustice, for by that it cannot be carried; but by the opposite, that he is your brother, that he was brought up with you; and thus you will lay hold on it, as it is to be carried.

44. These reasonings are unconnected: "I am richer than you, therefore I am better"; "I am more eloquent than you, therefore I am better." The connection is rather this: "I am richer than you, therefore my property is greater than yours;" "I am more eloquent than you, therefore my style is better than yours." But you, after all, are neither property nor style.

45. Does anyone bathe in a mighty little time? Don't say that he does it ill, but in a mighty little time. Does anyone drink a great quantity of wine? Don't say that he does ill, but that he drinks a great quantity. For, unless you perfectly understand the principle from which anyone acts, how should you know if he acts ill? Thus you will not run the hazard of assenting to any appearances

but such as you fully comprehend.

46. Never call yourself a philosopher, nor talk a great deal among the unlearned about theorems, but act conformably to them. Thus, at an entertainment, don't talk how persons ought to eat, but eat as you ought. For remember that in this manner Socrates also universally avoided all ostentation. And when persons came to him and desired to be recommended by him to philosophers, he took and- recommended them, so well did he bear being overlooked. So that if ever any talk should happen among the unlearned concerning philosophic theorems, be you, for the most part, silent. For there is great danger in immediately throwing out what you have not digested. And, if anyone tells you that you know nothing, and you are not nettled at it, then you may be sure that you have begun your business. For sheep don't throw up the grass to show the shepherds how much they have eaten; but, inwardly digesting their food, they outwardly produce wool and milk. Thus, therefore, do you likewise not show theorems to the unlearned, but the actions produced by them after they have been digested.

47. When you have brought yourself to supply the necessities of your body at a small price, don't pique yourself upon it; nor, if you drink water, be saying upon every occasion, "I drink water." But first consider how much more sparing and patient of hardship the poor are than we. But if at any time you would inure yourself by exercise to labor, and bearing hard trials, do it for your own sake, and not for the world; don't grasp statues, but, when you are violently thirsty, take a little cold water in your mouth, and spurt it out and tell nobody.

48. The condition and characteristic of a vulgar person, is, that he never expects either benefit or hurt from himself, but from externals. The condition and characteristic of a philosopher is, that he expects all hurt and benefit from himself. The marks of a proficient are, that he censures no one, praises no one, blames no one, accuses no one, says nothing concerning himself as being anybody, or knowing anything: when he is, in any instance, hindered or restrained, he accuses himself; and, if he is praised, he secretly laughs at the person who praises him; and, if he is censured, he makes no defense. But he goes about with the caution of sick or injured people, dreading to move anything that is set right, before it is perfectly fixed. He suppresses all desire in himself; he transfers his aversion to those things only which thwart the proper use of our own faculty of choice; the exertion of his active powers towards anything is very gentle; if he appears stupid or ignorant, he does not care, and, in a word, he watches himself as an enemy, and one in ambush.

49. When anyone shows himself overly confident in ability to understand and interpret the works of Chrysippus, say to yourself, " Unless Chrysippus had written obscurely, this person would have had no subject for his vanity. But what do I desire? To understand nature and follow her. I ask, then, who interprets her, and, finding Chrysippus does, I have recourse to him. I don't understand his writings. I seek, therefore, one to interpret them." So far there is nothing to value myself upon. And when I find an interpreter, what remains is to make use of his instructions. This alone is the valuable thing. But, if I admire nothing but merely the interpretation, what do I become more than a grammarian instead of a philosopher? Except, indeed, that instead of Homer I interpret Chrysippus. When anyone, therefore, desires me to read Chrysippus to him, I rather blush when I cannot show my actions agreeable and consonant to his discourse.

50. Whatever moral rules you have deliberately proposed to yourself. abide by them as they were laws, and as if you would be guilty of impiety by violating any of them. Don't regard what anyone says of you, for this, after all, is no concern of yours. How long, then, will you put off thinking yourself worthy of the highest improvements and follow the distinctions of reason? You have

received the philosophical theorems, with which you ought to be familiar, and you have been familiar with them. What other master, then, do you wait for, to throw upon that the delay of reforming yourself? You are no longer a boy, but a grown man. If, therefore, you will be negligent and slothful, and always add procrastination to procrastination, purpose to purpose, and fix day after day in which you will attend to yourself, you will insensibly continue without proficiency, and, living and dying, persevere in being one of the vulgar. This instant, then, think yourself worthy of living as a man grown up, and a proficient. Let whatever appears to be the best be to you an inviolable law. And if any instance of pain or pleasure, or glory or disgrace, is set before you, remember that now is the combat, now the Olympiad comes on, nor can it be put off. By once being defeated and giving way, proficiency is lost, or by the contrary preserved. Thus Socrates became perfect, improving himself by everything. attending to nothing but reason. And though you are not yet a Socrates, you ought, however, to live as one desirous of becoming a Socrates.

51. The first and most necessary topic in philosophy is that of the use of moral theorems, such as, "We ought not to lie;" the second is that of demonstrations, such as, "What is the origin of our obligation not to lie;" the third gives strength and articulation to the other two, such as, "What is the origin of this is a demonstration." For what is demonstration? What is consequence? What contradiction? What truth? What falsehood? The third topic, then, is necessary on the account of the second, and the second on the account of the first. But the most necessary, and that whereon we ought to rest, is the first. But we act just on the contrary. For we spend all our time on the third topic, and employ all our diligence about that, and entirely neglect the first. Therefore, at the same time that we lie, we are immediately prepared to show how it is demonstrated that lying is not right.

52. Upon all occasions we ought to have these maxims ready at hand:

> **"Conduct me, Jove, and you, 0 Destiny,**
> **Wherever your decrees have fixed my station." [Cleanthes]**
> **"I follow cheerfully; and, did I not,**
> **Wicked and wretched, I must follow still**
>
> **Whoever yields properly to Fate, is deemed**
> **Wise among men, and knows the laws of heaven." [Euripides, Frag. 965]**

And this third:

> **"0 Crito, if it thus pleases the gods, thus let it be. Anytus and Melitus may kill me indeed, but hurt me they cannot." [Plato's Crito and Apology]**

The Enchiridion, or Manual
Epictetus
c. 135 CE.
 This text file is based on and adapted from Elizabeth Carter's 1758 English translation of the Enchiridion. This is a working draft; please report errors.1

The Enchiridion

1. Some things are in our control and others not. Things in our control are opinion, pursuit, desire, aversion, and, in a word, whatever are our own actions. Things not in our control are body, property, reputation, command, and, in one word, whatever are not our own actions.

The things in our control are by nature free, unrestrained, unhindered; but those not in our control are weak, slavish, restrained, belonging to others. Remember, then, that if you suppose that things which are slavish by nature are also free, and that what belongs to others is your own, then you will be hindered. You will lament, you will be disturbed, and you will find fault both with gods and men. But if you suppose that only to be your own which is your own, and what belongs to others such as it really is, then no one will ever compel you or restrain you. Further, you will find fault with no one or accuse no one. You will do nothing against your will. No one will hurt you, you will have no enemies, and you not be harmed.

Aiming therefore at such great things, remember that you must not allow yourself to be carried, even with a slight tendency, towards the attainment of lesser things. Instead, you must entirely quit some things and for the present postpone the rest. But if you would both have these great things, along with power and riches, then you will not gain even the latter, because you aim at the former too: but you will absolutely fail of the former, by which alone happiness and freedom are achieved.

Work, therefore to be able to say to every harsh appearance, "You are but an appearance, and not absolutely the thing you appear to be." And then examine it by those rules which you have, and first, and chiefly, by this: whether it concerns the things which are in our own control, or those which are not; and, if it concerns anything not in our control, be prepared to say that it is nothing to you.

2. Remember that following desire promises the attainment of that of which you are desirous; and aversion promises the avoiding that to which you are averse. However, he who fails to obtain the object of his desire is disappointed, and he who incurs the object of his aversion wretched. If, then, you confine your aversion to those objects only which are contrary to the natural use of your faculties, which you have in your own control, you will never incur anything to which you are averse. But if you are averse to sickness, or death, or poverty, you will be wretched. Remove aversion, then, from all things that are not in our control, and transfer it to things contrary to the nature of what is in our control. But, for the present, totally suppress desire: for, if you desire any of the things which are not in your own control, you must necessarily be disappointed; and of those which are, and which it would be laudable to desire, nothing is yet in your possession. Use only the appropriate actions of pursuit and avoidance; and even these lightly, and with gentleness and reservation.

3. With regard to whatever objects give you delight, are useful, or are deeply loved, remember to tell yourself of what general nature they are, beginning from the most insignificant things. If, for example, you are fond of a specific ceramic cup, remind yourself that it is only ceramic cups in general of which you are fond. Then, if it breaks, you will not be disturbed. If you kiss your child, or your wife, say that you only kiss things which are human, and thus you will not be disturbed if either of them dies.

4. When you are going about any action, remind yourself what nature the action is. If you are going to bathe, picture to yourself the things which usually happen in the bath: some people splash the water, some push, some use abusive language, and others steal. Thus you will more safely go about this action if you say to yourself, "I will now go bathe, and keep my own mind in a state conformable to nature." And in the same manner

with regard to every other action. For thus, if any hindrance arises in bathing, you will have it ready to say, "It was not only to bathe that I desired, but to keep my mind in a state conformable to nature; and I will not keep it if I am bothered at things that happen.

5. Men are disturbed, not by things, but by the principles and notions which they form concerning things. Death, for instance, is not terrible, else it would have appeared so to Socrates. But the terror consists in our notion of death that it is terrible. When therefore we are hindered, or disturbed, or grieved, let us never attribute it to others, but to ourselves; that is, to our own principles. An uninstructed person will lay the fault of his own bad condition upon others. Someone just starting instruction will lay the fault on himself. Some who is perfectly instructed will place blame neither on others nor on himself.

6. Don't be prideful with any excellence that is not your own. If a horse should be prideful and say, " I am handsome," it would be supportable. But when you are prideful, and say, " I have a handsome horse," know that you are proud of what is, in fact, only the good of the horse. What, then, is your own? Only your reaction to the appearances of things. Thus, when you behave conformably to nature in reaction to how things appear, you will be proud with reason; for you will take pride in some good of your own.

7. Consider when, on a voyage, your ship is anchored; if you go on shore to get water you may along the way amuse yourself with picking up a shellish, or an onion. However, your thoughts and continual attention ought to be bent towards the ship, waiting for the captain to call on board; you must then immediately leave all these things, otherwise you will be thrown into the ship, bound neck and feet like a sheep. So it is with life. If, instead of an onion or a shellfish, you are given a wife or child, that is fine. But if the captain calls, you must run to the ship, leaving them, and regarding none of them. But if you are old, never go far from the ship: lest, when you are called, you should be unable to come in time.

8. Don't demand that things happen as you wish, but wish that they happen as they do happen, and you will go on well.

9. Sickness is a hindrance to the body, but not to your ability to choose, unless that is your choice. Lameness is a hindrance to the leg, but not to your ability to choose. Say this to yourself with regard to everything that happens, then you will see such obstacles as hindrances to something else, but not to yourself.

10. With every accident, ask yourself what abilities you have for making a proper use of it. If you see an attractive person, you will find that self-restraint is the ability you have against your desire. If you are in pain, you will find fortitude. If you hear unpleasant language, you will find patience. And thus habituated, the appearances of things will not hurry you away along with them.

11. Never say of anything, "I have lost it"; but, "I have returned it." Is your child dead? It is returned. Is your wife dead? She is returned. Is your estate taken away? Well, and is not that likewise returned? "But he who took it away is a bad man." What difference is it to you who the giver assigns to take it back? While he gives it to you to possess, take care of it; but don't view it as your own, just as travelers view a hotel.

12. If you want to improve, reject such reasonings as these: "If I neglect my affairs, I'll have no income; if I don't correct my servant, he will be bad." For it is better to die with hunger, exempt from grief and fear, than to live in affluence with perturbation; and it is better your servant should be bad, than you unhappy.

Begin therefore from little things. Is a little oil spilt? A little wine stolen? Say to yourself, "This is the price paid for apathy, for tranquillity, and nothing is to be had for nothing." When you call your servant, it is possible that he may not come; or, if he does, he may not do what you want. But he is by no means of such importance that it should be in his power to give you any disturbance.

13. If you want to improve, be content to be thought foolish and stupid with regard to external things. Don't wish to be thought to know anything; and even if you appear to be somebody important to others, distrust yourself. For, it is difficult to both keep your faculty of choice in a state conformable to nature, and at the same time acquire external things. But while you are careful about the one, you must of necessity neglect the other.

14. If you wish your children, and your wife, and your friends to live for ever,

you are stupid; for you wish to be in control of things which you cannot, you wish for things that belong to others to be your own. So likewise, if you wish your servant to be without fault, you are a fool; for you wish vice not to be vice," but something else. But, if you wish to have your desires undisappointed, this is in your own control. Exercise, therefore, what is in your control. He is the master of every other person who is able to confer or remove whatever that person wishes either to have or to avoid. Whoever, then, would be free, let him wish nothing, let him decline nothing, which depends on others else he must necessarily be a slave.

15. Remember that you must behave in life as at a dinner party. Is anything brought around to you? Put out your hand and take your share with moderation. Does it pass by you? Don't stop it. Is it not yet come? Don't stretch your desire towards it, but wait till it reaches you. Do this with regard to children, to a wife, to public posts, to riches, and you will eventually be a worthy partner of the feasts of the gods. And if you don't even take the things which are set before you, but are able even to reject them, then you will not only be a partner at the feasts of the gods, but also of their empire. For, by doing this, Diogenes, Heraclitus and others like them, deservedly became, and were called, divine.

16. When you see anyone weeping in grief because his son has gone abroad, or is dead, or because he has suffered in his affairs, be careful that the appearance may not misdirect you. Instead, distinguish within your own mind, and be prepared to say, "It's not the accident that distresses this person., because it doesn't distress another person; it is the judgment which he makes about it." As far as words go, however, don't reduce yourself to his level, and certainly do not moan with him. Do not moan inwardly either.

17. Remember that you are an actor in a drama, of such a kind as the author pleases to make it. If short, of a short one; if long, of a long one. If it is his pleasure you should act a poor man, a cripple, a governor, or a private person, see that you act it naturally. For this is your business, to act well the character assigned you; to choose it is another's.

18. When a raven happens to croak unluckily, don't allow the appearance hurry you away with it, but immediately make the distinction to yourself, and say, "None of these things are foretold to me; but either to my paltry body, or property, or reputation, or children, or wife. But to me all omens are lucky, if I will. For whichever of these things happens, it is in my control to derive advantage from it."

19. You may be unconquerable, if you enter into no combat in which it is not in your own control to conquer. When, therefore, you see anyone eminent in honors, or power, or in high esteem on any other account, take heed not to be hurried away with the appearance, and to pronounce him happy; for, if the essence of good consists in things in our own control, there will be no room for envy or emulation. But, for your part, don't wish to be a general, or a senator, or a consul, but to be free; and the only way to this is a contempt of things not in our own control.

20. Remember, that not he who gives ill language or a blow insults, but the principle which represents these things as insulting. When, therefore, anyone provokes you, be assured that it is your own opinion which provokes you. Try, therefore, in the first place, not to be hurried away with the appearance. For if you once gain time and respite, you will more easily command yourself.

21. Let death and exile, and all other things which appear terrible be daily before your eyes, but chiefly death, and you win never entertain any abject thought, nor too eagerly covet anything.

22. If you have an earnest desire of attaining to philosophy, prepare yourself from the very first to be laughed at, to be sneered by the multitude, to hear them say,." He is returned to us a philosopher all at once," and " Whence this supercilious look?" Now, for your part, don't have a supercilious look indeed; but keep steadily to those things which appear best to you as one appointed by God to this station. For remember that, if you adhere to the same point, those very persons who at first ridiculed will afterwards admire you. But if you are conquered by them, you will incur a double ridicule.

23. If you ever happen to turn your attention to externals, so as to wish to please anyone, be assured that you have ruined your scheme of life. Be contented, then, in everything with being a philosopher; and, if you wish to be thought so likewise by anyone, appear so to yourself, and it will suffice you.

24. Don't allow such considerations as these distress you. "I will live in dishonor, and be nobody anywhere." For, if dishonor is an evil, you can no more be involved in any evil by the means of another, than be engaged in anything base. Is it any business of yours, then, to get power, or to be admitted to an entertainment? By no means. How, then, after all, is this a dishonor? And how is it true that you will be nobody anywhere, when you ought to be somebody in those things only which are in your own control, in which you may be of the greatest consequence? "But my friends will be unassisted." -- What do you mean by unassisted? They will not have money from you, nor will you make them Roman citizens. Who told you, then, that these are among the things in our own control, and not the affair of others? And who can give to another the things which he has not himself? "Well, but get them, then, that we too may have a share." If I can get them with the preservation of my own honor and fidelity and greatness of mind, show me the way and I will get them; but if you require me to lose my own proper good that you may gain what is not good, consider how inequitable and foolish you are. Besides, which would you rather have, a sum of money, or a friend of fidelity and honor? Rather assist me, then, to gain this character than require me to do those things by which I may lose it. Well, but my country, say you, as far as depends on me, will be unassisted. Here again, what assistance is this you mean? "It will not have porticoes nor baths of your providing." And what signifies that? Why, neither does a smith provide it with shoes, or a shoemaker with arms. It is enough if everyone fully performs his own proper business. And were you to supply it with another citizen of honor and fidelity, would not he be of use to it? Yes. Therefore neither are you yourself useless to it. "What place, then, say you, will I hold in the state?" Whatever you can hold with the preservation of your fidelity and honor. But if, by desiring to be useful to that, you lose these, of what use can you be to your country when you are become faithless and void of shame.

25. Is anyone preferred before you at an entertainment, or in a compliment, or in being admitted to a consultation? If these things are good, you ought to be glad that he has gotten them; and if they are evil, don't be grieved that you have not gotten them. And remember that you cannot, without using the same means [which others do] to acquire things not in our own control, expect to be thought worthy of an equal share of them. For how can he who does not frequent the door of any [great] man, does not attend him, does not praise him, have an equal share with him who does? You are unjust, then, and insatiable, if you are unwilling to pay the price for which these things are sold, and would have them for nothing. For how much is lettuce sold? Fifty cents, for instance. If another, then, paying fifty cents, takes the lettuce, and you, not paying it, go without them, don't imagine that he has gained any advantage over you. For as he has the lettuce, so you have the fifty cents which you did not give. So, in the present case, you have not been invited to such a person's entertainment, because you have not paid him the price for which a supper is sold. It is sold for praise; it is sold for attendance. Give him then the value, if it is for your advantage. But if you would, at the same time, not pay the one and yet receive the other, you are insatiable, and a blockhead. Have you nothing, then, instead of the supper? Yes, indeed, you have: the not praising him, whom you don't like to praise; the not bearing with his behavior at coming in.

26. The will of nature may be learned from those things in which we don't distinguish from each other. For example, when our neighbor's boy breaks a cup, or the like, we are presently ready to say, "These things will happen." Be assured, then, that when your own cup likewise is broken, you ought to be affected just as when another's cup was broken. Apply this in like manner to greater things. Is the child or wife of another dead? There is no one who would not say, "This is a human accident." but if anyone's own child happens to die, it is presently, "Alas I how wretched am I!" But it should be remembered how we are affected in hearing the same thing concerning others.

27. As a mark is not set up for the sake of missing the aim, so neither does the nature of evil exist in the world.

28. If a person gave your body to any stranger he met on his way, you would certainly be angry. And do you feel no shame in handing over your own mind to be confused and mystified by anyone who happens to verbally attack you?

29. In every affair consider what precedes and follows, and then undertake it. Otherwise you will begin with spirit; but not having thought of the consequences, when some of them appear you will shamefully desist. "I would conquer at the Olympic games." But consider what precedes and follows, and then, if it is for your advantage, engage in

the affair. You must conform to rules, submit to a diet, refrain from dainties; exercise your body, whether you choose it or not, at a stated hour, in heat and cold; you must drink no cold water, nor sometimes even wine. In a word, you must give yourself up to your master, as to a physician. Then, in the combat, you may be thrown into a ditch, dislocate your arm, turn your ankle, swallow dust, be whipped, and, after all, lose the victory. When you have evaluated all this, if your inclination still holds, then go to war. Otherwise, take notice, you will behave like children who sometimes play like wrestlers, sometimes gladiators, sometimes blow a trumpet, and sometimes act a tragedy when they have seen and admired these shows. Thus you too will be at one time a wrestler, at another a gladiator, now a philosopher, then an orator; but with your whole soul, nothing at all. Like an ape, you mimic all you see, and one thing after another is sure to please you, but is out of favor as soon as it becomes familiar. For you have never entered upon anything considerately, nor after having viewed the whole matter on all sides, or made any scrutiny into it, but rashly, and with a cold inclination. Thus some, when they have seen a philosopher and heard a man speaking like Euphrates (though, indeed, who can speak like him?), have a mind to be philosophers too. Consider first, man, what the matter is, and what your own nature is able to bear. If you would be a wrestler, consider your shoulders, your back, your thighs; for different persons are made for different things. Do you think that you can act as you do, and be a philosopher? That you can eat and drink, and be angry and discontented as you are now? You must watch, you must labor, you must get the better of certain appetites, must quit your acquaintance, be despised by your servant, be laughed at by those you meet; come off worse than others in everything, in magistracies, in honors, in courts of judicature. When you have considered all these things round, approach, if you please; if, by parting with them, you have a mind to purchase apathy, freedom, and tranquillity. If not, don't come here; don't, like children, be one while a philosopher, then a publican, then an orator, and then one of Caesar's officers. These things are not consistent. You must be one man, either good or bad. You must cultivate either your own ruling faculty or externals, and apply yourself either to things within or without you; that is, be either a philosopher, or one of the vulgar.

30. Duties are universally measured by relations. Is anyone a father? If so, it is implied that the children should take care of him, submit to him in everything, patiently listen to his reproaches, his correction. But he is a bad father. Is you naturally entitled, then, to a good father? No, only to a father. Is a brother unjust? Well, keep your own situation towards him. Consider not what he does, but what you are to do to keep your own faculty of choice in a state conformable to nature. For another will not hurt you unless you please. You will then be hurt when you think you are hurt. In this manner, therefore, you will find, from the idea of a neighbor, a citizen, a general, the corresponding duties if you accustom yourself to contemplate the several relations.

31. Be assured that the essential property of piety towards the gods is to form right opinions concerning them, as existing "I and as governing the universe with goodness and justice. And fix yourself in this resolution, to obey them, and yield to them, and willingly follow them in all events, as produced by the most perfect understanding. For thus you will never find fault with the gods, nor accuse them as neglecting you. And it is not possible for this to be effected any other way than by withdrawing yourself from things not in our own control, and placing good or evil in those only which are. For if you suppose any of the things not in our own control to be either good or evil, when you are disappointed of what you wish, or incur what you would avoid, you must necessarily find fault with and blame the authors. For every animal is naturally formed to fly and abhor things that appear hurtful, and the causes of them; and to pursue and admire those which appear beneficial, and the causes of them. It is impractical, then, that one who supposes himself to be hurt should be happy about the person who, he thinks, hurts him, just as it is impossible to be happy about the hurt itself. Hence, also, a father is reviled by a son, when he does not impart to him the things which he takes to be good; and the supposing empire to be a good made Polynices and Eteocles mutually enemies. On this account the husbandman, the sailor, the merchant, on this account those who lose wives and children, revile the gods. For where interest is, there too is piety placed. So that, whoever is careful to regulate his desires and aversions as he ought, is, by the very same means, careful of piety likewise. But it is also incumbent on everyone to offer libations and sacrifices and first fruits, conformably to the customs of his country, with purity, and not in a slovenly manner, nor

negligently, nor sparingly, nor beyond his ability.

32. When you have recourse to divination, remember that you know not what the event will be, and you come to learn it of the diviner; but of what nature it is you know before you come, at least if you are a philosopher. For if it is among the things not in our own control, it can by no means be either good or evil. Don't, therefore, bring either desire or aversion with you to the diviner (else you will approach him trembling), but first acquire a distinct knowledge that every event is indifferent and nothing to you., of whatever sort it may be, for it will be in your power to make a right use of it, and this no one can hinder; then come with confidence to the gods, as your counselors, and afterwards, when any counsel is given you, remember what counselors you have assumed, and whose advice you will neglect if you disobey. Come to divination, as Socrates prescribed, in cases of which the whole consideration relates to the event, and in which no opportunities are afforded by reason, or any other art, to discover the thing proposed to be learned. When, therefore, it is our duty to share the danger of a friend or of our country, we ought not to consult the oracle whether we will share it with them or not. For, though the diviner should forewarn you that the victims are unfavorable, this means no more than that either death or mutilation or exile is portended. But we have reason within us, and it directs, even with these hazards, to the greater diviner, the Pythian god, who cast out of the temple the person who gave no assistance to his friend while another was murdering him.

33. Immediately prescribe some character and form of conduce to yourself, which you may keep both alone and in company.

Be for the most part silent, or speak merely what is necessary, and in few words. We may, however, enter, though sparingly, into discourse sometimes when occasion calls for it, but not on any of the common subjects, of gladiators, or horse races, or athletic champions, or feasts, the vulgar topics of conversation; but principally not of men, so as either to blame, or praise, or make comparisons. If you are able, then, by your own conversation bring over that of your company to proper subjects; but, if you happen to be taken among strangers, be silent.

Don't allow your laughter be much, nor on many occasions, nor profuse.

Avoid swearing, if possible, altogether; if not, as far as you are able.

Avoid public and vulgar entertainments; but, if ever an occasion calls you to them, keep your attention upon the stretch, that you may not imperceptibly slide into vulgar manners. For be assured that if a person be ever so sound himself, yet, if his companion be infected, he who converses with him will be infected likewise.

Provide things relating to the body no further than mere use; as meat, drink, clothing, house, family. But strike off and reject everything relating to show and delicacy.

As far as possible, before marriage, keep yourself pure from familiarities with women, and, if you indulge them, let it be lawfully." But don't therefore be troublesome and full of reproofs to those who use these liberties, nor frequently boast that you yourself don't.

If anyone tells you that such a person speaks ill of you, don't make excuses about what is said of you, but answer: " He does not know my other faults, else he would not have mentioned only these."

It is not necessary for you to appear often at public spectacles; but if ever there is a proper occasion for you to be there, don't appear more solicitous for anyone than for yourself; that is, wish things to be only just as they are, and him only to conquer who is the conqueror, for thus you will meet with no hindrance. But abstain entirely from declamations and derision and violent emotions. And when you come away, don't discourse a great deal on what has passed, and what does not contribute to your own amendment. For it would appear by such discourse that you were immoderately struck with the show.

Go not [of your own accord] to the rehearsals of any [authors], nor appear [at them] readily. But, if you do appear, keep your gravity and sedateness, and at the same time avoid being morose.

When you are going to confer with anyone, and particularly of those in a superior station, represent to yourself how Socrates or Zeno would behave in such a case, and you will not be at a loss to make a proper use of whatever may occur.

When you are going to any of the people in power, represent to yourself that you will not find him at home; that you will not be admitted; that the doors will not be

opened to you; that he will take no notice of you. If, with all this, it is your duty to go, bear what happens, and never say [to yourself], " It was not worth so much." For this is vulgar, and like a man dazed by external things.

In parties of conversation, avoid a frequent and excessive mention of your own actions and dangers. For, however agreeable it may be to yourself to mention the risks you have run, it is not equally agreeable to others to hear your adventures. Avoid, likewise, an endeavor to excite laughter. For this is a slippery point, which may throw you into vulgar manners, and, besides, may be apt to lessen you in the esteem of your acquaintance. Approaches to indecent discourse are likewise dangerous. Whenever, therefore, anything of this sort happens, if there be a proper opportunity, rebuke him who makes advances that way; or, at least, by silence and blushing and a forbidding look, show yourself to be displeased by such talk.

34. If you are struck by the appearance of any promised pleasure, guard yourself against being hurried away by it; but let the affair wait your leisure, and procure yourself some delay. Then bring to your mind both points of time: that in which you will enjoy the pleasure, and that in which you will repent and reproach yourself after you have enjoyed it; and set before you, in opposition to these, how you will be glad and applaud yourself if you abstain. And even though it should appear to you a seasonable gratification, take heed that its enticing, and agreeable and attractive force may not subdue you; but set in opposition to this how much better it is to be conscious of having gained so great a victory.

35. When you do anything from a clear judgment that it ought to be done, never shun the being seen to do it, even though the world should make a wrong supposition about it; for, if you don't act right, shun the action itself; but, if you do, why are you afraid of those who censure you wrongly?

36. As the proposition, "Either it is day or it is night," is extremely proper for a disjunctive argument, but quite improper in a conjunctive one, so, at a feast, to choose the largest share is very suitable to the bodily appetite, but utterly inconsistent with the social spirit of an entertainment. When you eat with another, then, remember not only the value of those things which are set before you to the body, but the value of that behavior which ought to be observed towards the person who gives the entertainment.

37. If you have assumed any character above your strength, you have both made an ill figure in that and quitted one which you might have supported.

38. When walking, you are careful not to step on a nail or turn your foot; so likewise be careful not to hurt the ruling faculty of your mind. And, if we were to guard against this in every action, we should undertake the action with the greater safety.

39. The body is to everyone the measure of the possessions proper for it, just as the foot is of the shoe. If, therefore, you stop at this, you will keep the measure; but if you move beyond it, you must necessarily be carried forward, as down a cliff; as in the case of a shoe, if you go beyond its fitness to the foot, it comes first to be gilded, then purple, and then studded with jewels. For to that which once exceeds a due measure, there is no bound.

40. Women from fourteen years old are flattered with the title of "mistresses" by the men. Therefore, perceiving that they are regarded only as qualified to give the men pleasure, they begin to adorn themselves, and in that to place ill their hopes. We should, therefore, fix our attention on making them sensible that they are valued for the appearance of decent, modest and discreet behavior.

41. It is a mark of want of genius to spend much time in things relating to the body, as to be long in our exercises, in eating and drinking, and in the discharge of other animal functions. These should be done incidentally and slightly, and our whole attention be engaged in the care of the understanding.

42. When any person harms you, or speaks badly of you, remember that he acts or speaks from a supposition of its being his duty. Now, it is not possible that he should follow what appears right to you, but what appears so to himself. Therefore, if he judges from a wrong appearance, he is the person hurt, since he too is the person deceived. For if anyone should suppose a true proposition to be false, the proposition is not hurt, but he who is deceived about it. Setting out, then, from these principles, you will meekly bear a person who reviles you, for you will say upon every occasion, "It seemed so to him."

43. Everything has two handles, the one by which it may be carried, the other by

which it cannot. If your brother acts unjustly, don't lay hold on the action by the handle of his injustice, for by that it cannot be carried; but by the opposite, that he is your brother, that he was brought up with you; and thus you will lay hold on it, as it is to be carried.

44. These reasonings are unconnected: "I am richer than you, therefore I am better"; "I am more eloquent than you, therefore I am better." The connection is rather this: "I am richer than you, therefore my property is greater than yours;" "I am more eloquent than you, therefore my style is better than yours." But you, after all, are neither property nor style.

45. Does anyone bathe in a mighty little time? Don't say that he does it ill, but in a mighty little time. Does anyone drink a great quantity of wine? Don't say that he does ill, but that he drinks a great quantity. For, unless you perfectly understand the principle from which anyone acts, how should you know if he acts ill? Thus you will not run the hazard of assenting to any appearances but such as you fully comprehend.

46. Never call yourself a philosopher, nor talk a great deal among the unlearned about theorems, but act conformably to them. Thus, at an entertainment, don't talk how persons ought to eat, but eat as you ought. For remember that in this manner Socrates also universally avoided all ostentation. And when persons came to him and desired to be recommended by him to philosophers, he took and- recommended them, so well did he bear being overlooked. So that if ever any talk should happen among the unlearned concerning philosophic theorems, be you, for the most part, silent. For there is great danger in immediately throwing out what you have not digested. And, if anyone tells you that you know nothing, and you are not nettled at it, then you may be sure that you have begun your business. For sheep don't throw up the grass to show the shepherds how much they have eaten; but, inwardly digesting their food, they outwardly produce wool and milk. Thus, therefore, do you likewise not show theorems to the unlearned, but the actions produced by them after they have been digested.

47. When you have brought yourself to supply the necessities of your body at a small price, don't pique yourself upon it; nor, if you drink water, be saying upon every occasion, "I drink water." But first consider how much more sparing and patient of hardship the poor are than we. But if at any time you would inure yourself by exercise to labor, and bearing hard trials, do it for your own sake, and not for the world; don't grasp statues, but, when you are violently thirsty, take a little cold water in your mouth, and spurt it out and tell nobody.

48. The condition and characteristic of a vulgar person, is, that he never expects either benefit or hurt from himself, but from externals. The condition and characteristic of a philosopher is, that he expects all hurt and benefit from himself. The marks of a proficient are, that he censures no one, praises no one, blames no one, accuses no one, says nothing concerning himself as being anybody, or knowing anything: when he is, in any instance, hindered or restrained, he accuses himself; and, if he is praised, he secretly laughs at the person who praises him; and, if he is censured, he makes no defense. But he goes about with the caution of sick or injured people, dreading to move anything that is set right, before it is perfectly fixed. He suppresses all desire in himself; he transfers his aversion to those things only which thwart the proper use of our own faculty of choice; the exertion of his active powers towards anything is very gentle; if he appears stupid or ignorant, he does not care, and, in a word, he watches himself as an enemy, and one in ambush.

49. When anyone shows himself overly confident in ability to understand and interpret the works of Chrysippus, say to yourself, " Unless Chrysippus had written obscurely, this person would have had no subject for his vanity. But what do I desire? To understand nature and follow her. I ask, then, who interprets her, and, finding Chrysippus does, I have recourse to him. I don't understand his writings. I seek, therefore, one to interpret them." So far there is nothing to value myself upon. And when I find an interpreter, what remains is to make use of his instructions. This alone is the valuable thing. But, if I admire nothing but merely the interpretation, what do I become more than a grammarian instead of a philosopher? Except, indeed, that instead of Homer I interpret Chrysippus. When anyone, therefore, desires me to read Chrysippus to him, I rather blush when I cannot show my actions agreeable and consonant to his discourse.

50. Whatever moral rules you have deliberately proposed to yourself. abide by them as they were laws, and as if you would be guilty of impiety by violating any of them. Don't regard what anyone says of you, for this, after all, is no concern of yours.

How long, then, will you put off thinking yourself worthy of the highest improvements and follow the distinctions of reason? You have received the philosophical theorems, with which you ought to be familiar, and you have been familiar with them. What other master, then, do you wait for, to throw upon that the delay of reforming yourself? You are no longer a boy, but a grown man. If, therefore, you will be negligent and slothful, and always add procrastination to procrastination, purpose to purpose, and fix day after day in which you will attend to yourself, you will insensibly continue without proficiency, and, living and dying, persevere in being one of the vulgar. This instant, then, think yourself worthy of living as a man grown up, and a proficient. Let whatever appears to be the best be to you an inviolable law. And if any instance of pain or pleasure, or glory or disgrace, is set before you, remember that now is the combat, now the Olympiad comes on, nor can it be put off. By once being defeated and giving way, proficiency is lost, or by the contrary preserved. Thus Socrates became perfect, improving himself by everything. attending to nothing but reason. And though you are not yet a Socrates, you ought, however, to live as one desirous of becoming a Socrates.

51. The first and most necessary topic in philosophy is that of the use of moral theorems, such as, "We ought not to lie;" the second is that of demonstrations, such as, "What is the origin of our obligation not to lie;" the third gives strength and articulation to the other two, such as, "What is the origin of this is a demonstration." For what is demonstration? What is consequence? What contradiction? What truth? What falsehood? The third topic, then, is necessary on the account of the second, and the second on the account of the first. But the most necessary, and that whereon we ought to rest, is the first. But we act just on the contrary. For we spend all our time on the third topic, and employ all our diligence about that, and entirely neglect the first. Therefore, at the same time that we lie, we are immediately prepared to show how it is demonstrated that lying is not right.

52. Upon all occasions we ought to have these maxims ready at hand:

"Conduct me, Jove, and you, 0 Destiny,
Wherever your decrees have fixed my station." [Cleanthes]
"I follow cheerfully; and, did I not,
Wicked and wretched, I must follow still
Whoever yields properly to Fate, is deemed
Wise among men, and knows the laws of heaven." [Euripides, Frag. 965]

And this third:

"0 Crito, if it thus pleases the gods, thus let it be. Anytus and Melitus may kill me indeed, but hurt me they cannot." [Plato's Crito and Apology]

The Internet Encyclopedia of Philosophy

Letter to Menoeceus

 Epicurus's "Letter to Menoeceus" is preserved in Diogenes Laertius's Lives of Eminent Philosophers. The following is from Robert Drew Hicks's 1925 translation. This is a working draft; please report errors.[1]

Greeting.

Let no one be slow to seek wisdom when he is young nor weary in the search thereof when he is grown old. For no age is too early or too late for the health of the soul. And to say that the season for studying philosophy has not yet come, or that it is past and gone, is like saying that the season for happiness is not yet or that it is now no more. Therefore, both old and young ought to seek wisdom, the former in order that, as age comes over him, he may be young in good things because of the grace of what has been, and the latter in order that, while he is young, he may at the same time be old, because he has no fear of the things which are to come. So we must exercise ourselves in the things which bring happiness, since, if that be present, we have everything, and, if that be absent, all our actions are directed toward attaining it.

Those things which without ceasing I have declared to you, those do, and exercise yourself in those, holding them to be the elements of right life. First believe that God is a living being immortal and happy, according to the notion of a god indicated by the common sense of humankind; and so of him anything that is at agrees not with about him whatever may uphold both his happyness and his immortality. For truly there are gods, and knowledge of them is evident; but they are not such as the multitude believe, seeing that people do not steadfastly maintain the notions they form respecting them. Not the person who denies the gods worshipped by the multitude, but he who affirms of the gods what the multitude believes about them is truly impious. For the utterances of the multitude about the gods are not true preconceptions but false assumptions; hence it is that the greatest evils happen to the wicked and the greatest blessings happen to the good from the hand of the gods, seeing that they are always favorable to their own good qualities and take pleasure in people like to themselves, but reject as alien whatever is not of their kind.

Accustom yourself to believe that death is nothing to us, for good and evil imply awareness, and death is the privation of all awareness; therefore a right understanding that death is nothing to us makes the mortality of life enjoyable, not by adding to life an unlimited time, but by taking away the yearning after immortality. For life has no terror; for those who thoroughly apprehend that there are no terrors for them in ceasing to live. Foolish, therefore, is the person who says that he fears death, not because it will pain when it comes, but because it pains in the prospect. Whatever causes no annoyance when it is present, causes only a groundless pain in the expectation. Death, therefore, the most awful of evils, is nothing to us, seeing that, when we are, death is not come, and, when death is come, we are not. It is nothing, then, either to the living or to the dead, for with the living it is not and the dead exist no longer. But in the world, at one time people shun death as the

greatest of all evils, and at another time choose it as a respite from the evils in life. The wise person does not deprecate life nor does he fear the cessation of life. The thought of life is no offense to him, nor is the cessation of life regarded as an evil. And even as people choose of food not merely and simply the larger portion, but the more pleasant, so the wise seek to enjoy the time which is most pleasant and not merely that which is longest. And he who admonishes the young to live well and the old to make a good end speaks foolishly, not merely because of the desirability of life, but because the same exercise at once teaches to live well and to die well. Much worse is he who says that it were good not to be born, but when once one is born to pass with all speed through the gates of Hades. For if he truly believes this, why does he not depart from life? It were easy for him to do so, if once he were firmly convinced. If he speaks only in mockery, his words are foolishness, for those who hear believe him not.

We must remember that the future is neither wholly ours nor wholly not ours, so that neither must we count upon it as quite certain to come nor despair of it as quite certain not to come.

We must also reflect that of desires some are natural, others are groundless; and that of the natural some are necessary as well as natural, and some natural only. And of the necessary desires some are necessary if we are to be happy, some if the body is to be rid of uneasiness, some if we are even to live. He who has a clear and certain understanding of these things will direct every preference and aversion toward securing health of body and tranquillity of mind, seeing that this is the sum and end of a happy life. For the end of all our actions is to be free from pain and fear, and, when once we have attained all this, the tempest of the soul is laid; seeing that the living creature has no need to go in search of something that is lacking, nor to look anything else by which the good of the soul and of the body will be fulfilled. When we are pained pleasure, then, and then only, do we feel the need of pleasure. For this reason we call pleasure the alpha and omega of a happy life. Pleasure is our first and kindred good. It is the starting-point of every choice and of every aversion, and to it we come back, inasmuch as we make feeling the rule by which to judge of every good thing. And since pleasure is our first and native good, for that reason we do not choose every pleasure whatever, but often pass over many pleasures when a greater annoyance ensues from them. And often we consider pains superior to pleasures when submission to the pains for a long time brings us as a consequence a greater pleasure. While therefore all pleasure because it is naturally akin to us is good, not all pleasure is worthy of choice, just as all pain is an evil and yet not all pain is to be shunned. It is, however, by measuring one against another, and by looking at the conveniences and inconveniences, teat all these matters must be judged. Sometimes we treat the good as an evil, and the evil, on the contrary, as a good. Again, we regard. independence of outward things as a great good, not so as in all cases to use little, but so as to be contented with little if we have not much, being honestly persuaded that they have the sweetest enjoyment of luxury who stand least in need of it, and that whatever is natural is easily procured and only the vain and worthless hard to win. Plain fare gives as much pleasure as a costly diet, when one the pain of want has been removed, while bread an water confer the highest possible pleasure when they are brought to hungry lips. To habituate one's se therefore, to simple and inexpensive diet supplies al that is needful for health, and enables a person to meet the necessary requirements of life without shrinking and it places us in a better condition when we approach at intervals a costly fare and renders us fearless of fortune.

When we say, then, that pleasure is the end and aim, we do not mean the pleasures of the prodigal or the pleasures of sensuality, as we are understood to do by some through ignorance, prejudice, or willful misrepresentation. By pleasure we mean the absence of pain in the body and of trouble in

the soul. It is not an unbroken succession of drinking-bouts and of merrymaking, not sexual love, not the enjoyment of the fish and other delicacies of a luxurious table, which produce a pleasant life; it is sober reasoning, searching out the grounds of every choice and avoidance, and banishing those beliefs through which the greatest disturbances take possession of the soul. Of all this the d is prudence. For this reason prudence is a more precious thing even than the other virtues, for ad a life of pleasure which is not also a life of prudence, honor, and justice; nor lead a life of prudence, honor, and justice, which is not also a life of pleasure. For the virtues have grown into one with a pleasant life, and a pleasant life is inseparable from them.

Who, then, is superior in your judgment to such a person? He holds a holy belief concerning the gods, and is altogether free from the fear of death. He has diligently considered the end fixed by nature, and understands how easily the limit of good things can be reached and attained, and how either the duration or the intensity of evils is but slight. Destiny which some introduce as sovereign over all things, he laughs to scorn, affirming rather that some things happen of necessity, others by chance, others through our own agency. For he sees that necessity destroys responsibility and that chance or fortune is inconstant; whereas our own actions are free, and it is to them that praise and blame naturally attach. It were better, indeed, to accept the legends of the gods than to bow beneath destiny which the natural philosophers have imposed. The one holds out some faint hope that we may escape if we honor the gods, while the necessity of the naturalists is deaf to all entreaties. Nor does he hold chance to be a god, as the world in general does, for in the acts of a god there is no disorder; nor to be a cause, though an uncertain one, for he believes that no good or evil is dispensed by chance to people so as to make life happy, though it supplies the starting-point of great good and great evil. He believes that the misfortune of the wise is better than the prosperity of the fool. It is better, in short, that what is well judged in action should not owe its successful issue to the aid of chance.

Exercise yourself in these and kindred precepts day and night, both by yourself and with him who is like to you; then never, either in waking or in dream, will you be disturbed, but will live as a god among people. For people lose all appearance of mortality by living in the midst of immortal blessings.

Epicurus
Letter to Menoeceus

 Epicurus's "Letter to Menoeceus" is preserved in Diogenes Laertius's Lives of Eminent Philosophers. The following is from Robert Drew Hicks's 1925 translation. This is a working draft; please report errors.[1]

* * * *

Greeting.

Let no one be slow to seek wisdom when he is young nor weary in the search thereof when he is grown old. For no age is too early or too late for the health of the soul. And to say that the season for studying philosophy has not yet come, or that it is past and gone, is like saying that the season for happiness is not yet or that it is now no more. Therefore, both old and young ought to seek wisdom, the former in order that, as age comes over him, he may be young in good things because of the grace of what has been, and the latter in order that, while he is young, he may at the same time be old, because he has no fear of the things which are to come. So we must exercise ourselves in the things which bring happiness, since, if that be present, we have everything, and, if that be absent, all our actions are directed toward attaining it.

Those things which without ceasing I have declared to you, those do, and exercise yourself in those, holding them to be the elements of right life. First believe that God is a living being immortal and happy, according to the notion of a god indicated by the common sense of humankind; and so of him anything that is at agrees not with about him whatever may uphold both his happyness and his immortality. For truly there are gods, and knowledge of them is evident; but they are not such as the multitude believe, seeing that people do not steadfastly maintain the notions they form respecting them. Not the person who denies the gods worshipped by the multitude, but he who affirms of the gods what the multitude believes about them is truly impious. For the utterances of the multitude about the gods are not true preconceptions but false assumptions; hence it is that the greatest evils happen to the wicked and the greatest blessings happen to the good from the hand of the gods, seeing that they are always favorable to their own good qualities and take pleasure in people like to themselves, but reject as alien whatever is not of their kind.

Accustom yourself to believe that death is nothing to us, for good and evil imply awareness, and death is the privation of all awareness; therefore a right understanding that death is nothing to us makes the mortality of life enjoyable, not by adding to life an unlimited time, but by taking away the yearning after immortality. For life has no terror; for those who thoroughly apprehend that there are no terrors for them in ceasing to live. Foolish, therefore, is the person who says that he fears death, not because it will

pain when it comes, but because it pains in the prospect. Whatever causes no annoyance when it is present, causes only a groundless pain in the expectation. Death, therefore, the most awful of evils, is nothing to us, seeing that, when we are, death is not come, and, when death is come, we are not. It is nothing, then, either to the living or to the dead, for with the living it is not and the dead exist no longer. But in the world, at one time people shun death as the greatest of all evils, and at another time choose it as a respite from the evils in life. The wise person does not deprecate life nor does he fear the cessation of life. The thought of life is no offense to him, nor is the cessation of life regarded as an evil. And even as people choose of food not merely and simply the larger portion, but the more pleasant, so the wise seek to enjoy the time which is most pleasant and not merely that which is longest. And he who admonishes the young to live well and the old to make a good end speaks foolishly, not merely because of the desirability of life, but because the same exercise at once teaches to live well and to die well. Much worse is he who says that it were good not to be born, but when once one is born to pass with all speed through the gates of Hades. For if he truly believes this, why does he not depart from life? It were easy for him to do so, if once he were firmly convinced. If he speaks only in mockery, his words are foolishness, for those who hear believe him not.

We must remember that the future is neither wholly ours nor wholly not ours, so that neither must we count upon it as quite certain to come nor despair of it as quite certain not to come.

We must also reflect that of desires some are natural, others are groundless; and that of the natural some are necessary as well as natural, and some natural only. And of the necessary desires some are necessary if we are to be happy, some if the body is to be rid of uneasiness, some if we are even to live. He who has a clear and certain understanding of these things will direct every preference and aversion toward securing health of body and tranquillity of mind, seeing that this is the sum and end of a happy life. For the end of all our actions is to be free from pain and fear, and, when once we have attained all this, the tempest of the soul is laid; seeing that the living creature has no need to go in search of something that is lacking, nor to look anything else by which the good of the soul and of the body will be fulfilled. When we are pained pleasure, then, and then only, do we feel the need of pleasure. For this reason we call pleasure the alpha and omega of a happy life. Pleasure is our first and kindred good. It is the starting-point of every choice and of every aversion, and to it we come back, inasmuch as we make feeling the rule by which to judge of every good thing. And since pleasure is our first and native good, for that reason we do not choose every pleasure whatever, but often pass over many pleasures when a greater annoyance ensues from them. And often we consider pains superior to pleasures when submission to the pains for a long time brings us as a consequence a greater pleasure. While therefore all pleasure because it is naturally akin to us is good, not all pleasure is worthy of choice, just as all pain is an evil and yet not all pain is

to be shunned. It is, however, by measuring one against another, and by looking at the conveniences and inconveniences, teat all these matters must be judged. Sometimes we treat the good as an evil, and the evil, on the contrary, as a good. Again, we regard. independence of outward things as a great good, not so as in all cases to use little, but so as to be contented with little if we have not much, being honestly persuaded that they have the sweetest enjoyment of luxury who stand least in need of it, and that whatever is natural is easily procured and only the vain and worthless hard to win. Plain fare gives as much pleasure as a costly diet, when one the pain of want has been removed, while bread an water confer the highest possible pleasure when they are brought to hungry lips. To habituate one's se therefore, to simple and inexpensive diet supplies al that is needful for health, and enables a person to meet the necessary requirements of life without shrinking and it places us in a better condition when we approach at intervals a costly fare and renders us fearless of fortune.

When we say, then, that pleasure is the end and aim, we do not mean the pleasures of the prodigal or the pleasures of sensuality, as we are understood to do by some through ignorance, prejudice, or willful misrepresentation. By pleasure we mean the absence of pain in the body and of trouble in the soul. It is not an unbroken succession of drinking-bouts and of merrymaking, not sexual love, not the enjoyment of the fish and other delicacies of a luxurious table, which produce a pleasant life; it is sober reasoning, searching out the grounds of every choice and avoidance, and banishing those beliefs through which the greatest disturbances take possession of the soul. Of all this the d is prudence. For this reason prudence is a more precious thing even than the other virtues, for ad a life of pleasure which is not also a life of prudence, honor, and justice; nor lead a life of prudence, honor, and justice, which is not also a life of pleasure. For the virtues have grown into one with a pleasant life, and a pleasant life is inseparable from them.

Who, then, is superior in your judgment to such a person? He holds a holy belief concerning the gods, and is altogether free from the fear of death. He has diligently considered the end fixed by nature, and understands how easily the limit of good things can be reached and attained, and how either the duration or the intensity of evils is but slight. Destiny which some introduce as sovereign over all things, he laughs to scorn, affirming rather that some things happen of necessity, others by chance, others through our own agency. For he sees that necessity destroys responsibility and that chance or fortune is inconstant; whereas our own actions are free, and it is to them that praise and blame naturally attach. It were better, indeed, to accept the legends of the gods than to bow beneath destiny which the natural philosophers have imposed. The one holds out some faint hope that we may escape if we honor the gods, while the necessity of the naturalists is deaf to all entreaties. Nor does he hold chance to be a god, as the world in general does, for in the acts of a god there is no disorder; nor to be a cause, though an uncertain one, for he believes that no good or evil is dispensed by chance to

people so as to make life happy, though it supplies the starting-point of great good and great evil. He believes that the misfortune of the wise is better than the prosperity of the fool. It is better, in short, that what is well judged in action should not owe its successful issue to the aid of chance.

Exercise yourself in these and kindred precepts day and night, both by yourself and with him who is like to you; then never, either in waking or in dream, will you be disturbed, but will live as a god among people. For people lose all appearance of mortality by living in the midst of immortal blessings.

Principal Doctrines

Epicurus

 Epicurus's "Principal Doctrines" are preserved in Diogenes Laertius's Lives of Eminent Philosophers. The following is from Robert Drew Hicks's 1925 translation. This is a working draft; please report errors.[1]

---

1. A happy and eternal being has no trouble himself and brings no trouble upon any other being; hence he is exempt from movements of anger and partiality, for every such movement implies weakness

2. Death is nothing to us; for the body, when it has been resolved into its elements, has no feeling, and that which has no feeling is nothing to us.

3. The magnitude of pleasure reaches its limit in the removal of all pain. When pleasure is present, so long as it is uninterrupted, there is no pain either of body or of mind or of both together.

4. Continuous pain does not last long in the body; on the contrary, pain, if extreme, is present a short time, and even that degree of pain which barely outweighs pleasure in the body does not last for many days together. Illnesses of long duration even permit of an excess of pleasure over pain in the body.

5. It is impossible to live a pleasant life without living wisely and well and justly, and it is impossible to live wisely and well and justly without living pleasantly. Whenever any one of these is lacking, when, for instance, the person is not able to live wisely, though he lives well and justly, it is impossible for him to live a pleasant life.

6. In order to obtain security from other people any means whatever of procuring this was a natural good.

7. Some people have sought to become famous and renowned, thinking that thus they would make themselves secure against their fellow-humans. If, then, the life of such persons really was secure, they attained natural good; if, however, it was insecure, they have not attained the end which by nature's own prompting they originally sought.

8. No pleasure is in itself evil, but the things which produce certain pleasures entail annoyances many times greater than the pleasures themselves.

9. If all pleasure had been capable of accumulation, -- if this had gone on not only be recurrences in time, but all over the frame or, at any rate, over the principal parts of human nature, there would never have been any difference between one pleasure and another, as in fact there is.

10. If the objects which are productive of pleasures to profligate persons really freed them from fears of the mind, -- the fears, I mean, inspired by celestial and atmospheric phenomena, the fear of death, the fear of pain; if, further, they taught them to limit their desires, we should never have any

fault to find with such persons, for they would then be filled with pleasures to overflowing on all sides and would be exempt from all pain, whether of body or mind, that is, from all evil.

11. If we had never been molested by alarms at celestial and atmospheric phenomena, nor by the misgiving that death somehow affects us, nor by neglect of the proper limits of pains and desires, we should have had no need to study natural science.

12. It would be impossible to banish fear on matters of the highest importance, if a person did not know the nature of the whole universe, but lived in dread of what the legends tell us. Hence without the study of nature there was no enjoyment of unmixed pleasures.

13. There would be no advantage in providing security against our fellow humans, so long as we were alarmed by occurrences over our heads or beneath the earth or in general by whatever happens in the boundless universe.

14. When tolerable security against our fellow humans is attained, then on a basis of power sufficient to afford supports and of material prosperity arises in most genuine form the security of a quiet private life withdrawn from the multitude.

15. Nature's wealth at once has its bounds and is easy to procure; but the wealth of vain fancies recedes to an infinite distance.

16. Fortune but seldom interferes with the wise person; his greatest and highest interests have been, are, and will be, directed by reason throughout the course of his life.

17. The just person enjoys. the greatest peace of mind, while the unjust is full of the utmost disquietude.

18. Pleasure in the body admits no increase when once the pain of want has been removed; after that it only admits of variation. The limit of pleasure in the mind, however, is reached when we reflect on the things themselves and their congeners which cause the mind the greatest alarms.

19. Unlimited time and limited time afford an equal amount of pleasure, if we measure the limits of that pleasure by reason.

20. The body receives as unlimited the limits of pleasure; and to provide it requires unlimited time. But the mind, grasping in thought what the end and limit of the body is, and banishing the terrors of futurity, procures a complete and perfect life, and has no longer any need of unlimited time. Nevertheless it does not shun pleasure, and even in the hour of death, when ushered out of existence by circumstances, the mind does not lack enjoyment of the best life.

21. He who understands the limits of life knows how easy it is to procure enough to remove the pain of want and make the whole of life complete and perfect. Hence he has no longer any need of things which are not to be won save by labor and conflict.

22. We must take into account as the end all that really exists and all clear evidence of sense to which we refer our opinions; for otherwise everything will be full of uncertainty and confusion.

23. If you fight against all your sensations, you will have no standard to which to refer, and thus no means of judging even those judgments which you pronounce false.

24. If you reject absolutely any single sensation without stopping to discriminate with respect to that which awaits confirmation between matter of opinion and that which is already present, whether in sensation or in feelings or in any immediate perception of the mind, you will throw into confusion even the rest of your sensations by your groundless belief and so you will be rejecting the standard of truth altogether. If in your ideas based upon opinion you hastily affirm as true all that

awaits confirmation as well as that which does not, you will not escape error, as you will be maintaining complete ambiguity whenever it is a case of judging between right and wrong opinion.

25. If you do not on every separate occasion refer each of your actions to the end prescribed by nature, but instead of this in the act of choice or avoidance swerve aside to some other end, your acts will not be consistent with your theories.

26. All such desires as lead to no pain when they remain ungratified are unnecessary, and the longing is easily got rid of, when the thing desired is difficult to procure or when the desires seem likely to produce harm.

27. Of all the means which are procured by wisdom to ensure happiness throughout the whole of life, by far the most important is the acquisition of friends.

28. The same conviction which inspires confidence that nothing we have to fear is eternal or even of long duration, also enables us to see that even in our limited conditions of life nothing enhances our security so much as friendship.

29. Of our desires some are natural and necessary others are natural, but not necessary; others, again, are neither natural nor necessary, but are due to illusory opinion.

30. Those natural desires which entail no pain when not gratified, though their objects are vehemently pursued, are also due to illusory opinion; and when they are not got rid of, it is not because of their own nature, but because of the person's illusory opinion.

31. Natural justice is a symbol or expression of usefullness, to prevent one person from harming or being harmed by another.

32. Those animals which are incapable of making covenants with one another, to the end that they may neither inflict nor suffer harm, are without either justice or injustice. And those tribes which either could not or would not form mutual covenants to the same end are in like case.

33. There never was an absolute justice, but only an agreement made in reciprocal association in whatever localities now and again from time to time, providing against the infliction or suffering of harm.

34. Injustice is not in itself an evil, but only in its consequence, viz. the terror which is excited by apprehension that those appointed to punish such offenses will discover the injustice.

35. It is impossible for the person who secretly violates any article of the social compact to feel confident that he will remain undiscovered, even if he has already escaped ten thousand times; for right on to the end of his life he is never sure he will not be detected.

36. Taken generally, justice is the same for all, to wit, something found useful in mutual association; but in its application to particular cases of locality or conditions of whatever kind, it varies under different circumstances.

37. Among the things accounted just by conventional law, whatever in the needs of mutual association is attested to be useful, is thereby stamped as just, whether or not it be the same for all; and in case any law is made and does not prove suitable to the usefulness of mutual association, then this is no longer just. And should the usefulness which is expressed by the law vary and only for a time correspond with the prior conception, nevertheless for the time being it was just, so long as we do not trouble ourselves about empty words, but look simply at the facts.

38. Where without any change in circumstances the conventional laws, when judged by their consequences, were seen not to correspond with the notion of justice, such laws were not really

just; but wherever the laws have ceased to be useful in consequence of a change in circumstances, in that case the laws were for the time being just when they were useful for the mutual association of the citizens, and subsequently ceased to be just when they ceased to be useful.

39. He who best knew how to meet fear of external foes made into one family all the creatures he could; and those he could not, he at any rate did not treat as aliens; and where he found even this impossible, he avoided all association, and, so far as was useful, kept them at a distance.

40. Those who were best able to provide themselves with the means of security against their neighbors, being thus in possession of the surest guarantee, passed the most agreeable life in each other's society; and their enjoyment of the fullest intimacy was such that, if one of them died before his time, the survivors did not mourn his death as if it called for sympathy.

Epicurus
Principal Doctrines

 Epicurus's "Principal Doctrines" are preserved in Diogenes Laertius's Lives of Eminent Philosophers. The following is from Robert Drew Hicks's 1925 translation. This is a working draft; please report errors.[1]

* * * *

1. A happy and eternal being has no trouble himself and brings no trouble upon any other being; hence he is exempt from movements of anger and partiality, for every such movement implies weakness

2. Death is nothing to us; for the body, when it has been resolved into its elements, has no feeling, and that which has no feeling is nothing to us.

3. The magnitude of pleasure reaches its limit in the removal of all pain. When pleasure is present, so long as it is uninterrupted, there is no pain either of body or of mind or of both together.

4. Continuous pain does not last long in the body; on the contrary, pain, if extreme, is present a short time, and even that degree of pain which barely outweighs pleasure in the body does not last for many days together. Illnesses of long duration even permit of an excess of pleasure over pain in the body.

5. It is impossible to live a pleasant life without living wisely and well and justly, and it is impossible to live wisely and well and justly without living pleasantly. Whenever any one of these is lacking, when, for instance, the person is not able to live wisely, though he lives well and justly, it is impossible for him to live a pleasant life.

6. In order to obtain security from other people any means whatever of procuring this was a natural good.

7. Some people have sought to become famous and renowned, thinking that thus they would make themselves secure against their fellow-humans. If, then, the life of such persons really was secure, they attained natural good; if, however, it was insecure, they have not attained the end which by nature's own prompting they originally sought.

8. No pleasure is in itself evil, but the things which produce certain pleasures entail annoyances many times greater than the pleasures themselves.

9. If all pleasure had been capable of accumulation, -- if this had gone on not only be recurrences in time, but all over the frame or, at any rate, over the principal parts of human nature, there would never have been any difference between one pleasure and another, as in fact there is.

10. If the objects which are productive of pleasures to profligate persons really freed them from fears of the mind, -- the fears, I mean, inspired by celestial and atmospheric phenomena, the fear of death, the fear of pain; if, further, they taught them to limit their desires, we should never have any fault to find with such persons, for they would then be filled with pleasures to overflowing on all sides and would be exempt from all pain, whether of body or mind, that is, from all evil.

Hume's Writings

As time permits, text files of Hume's complete writings will be available here. Next in the pipeline: the *Treatise*.

- **A Treatise of Human Nature (Book I) [text|rtf]**
- **Essays, Moral and Literary**
  - **Of the Delicacy of Taste and Passion [text|rtf]**
  - **Of the Liberty of the Press [text|rtf]**

- Of Essay Writing [text|rtf]
- Of the Rise and Progress of the Arts and Sciences [text|rtf]
- Of Superstition and Enthusiasm [text|rtf]
- Of Tragedy [text|rtf]
- Of the Standard of Taste [text|rtf]

- A Letter from a Gentleman to his Friend in Edinburgh [text|rtf]
- An Enquiry Concerning Human Understanding [text|rtf]
- The Natural History of Religion [text|rtf]
- My Own Life [text|rtf]
- Dialogues Concerning Natural Religion [text|rtf]
- Essays on Suicide and Immortality (complete 1783 edition) [text|rtf]

18th Century British Reviews of Hume's Writings

Between 1739 and 1784, no less than 25 British reviews of Hume's first edition works appeared. The following is a partial list of those reviews (others will be added).

- Review of Hume's Treatise, **History of the Works of the Learned (1739)** [text|rtf]
- Review of Hume's Second Enquiry, **Monthly Review (1752)** [text|rtf]
- Review of Hume's Four Dissertations, **Monthly Review (1757)** [text|rtf]
- Review of Hume's Dialogues, **Monthly Review (1779)** [text|rtf]
- Review of Hume's Essays on Suicide, **Gentleman's Magazine (1784)** [text|rtf]
- Review of Hume's Essays on Suicide, **Monthly Review (1784)** [text|rtf]

Early Commentaries on Hume's Writings

Since Hume's first publication in 1739, thousands of books, pamphlets and articles on Hume's writings have appeared. The vast majority of these discussions are out of print and many can be accessed only through library special collections. The following is a partial list of early commentaries.

- Letter to "Commonsense" on Hume's Account of Necessity **(1740), anonymous** [text|rtf]
- Hume on Miracles **(1749), William Warburton** [text|rtf]
- The Credibility of Miracles Defended **(1751), Thomas Rutherforth** [text|rtf]

- An Examination of Mr. Hume's Arguments in his Essay on Miracles (1752), Anthony Ellys [text|rtf]
- Some Late Opinions Concerning the Foundation of Morality (1753), anonymous [text|rtf]
- Postscript on Mr. Hume's Natural History of Religion (1757), Caleb Fleming [text|rtf]
- Remarks on... the Natural History of Religion (1757), William Warburton [text|rtf]
- Remarks upon the Natural History of Religion (1758), Thomas Stona [text|rtf]
- The Insufficiency of Mr. Hume's Objection to... Miracles (1776), W.S. Powell [text|rtf]
- Remarks on... Dialogues Concerning Natural Religion (1780), Thomas Hayter [text|rtf]
- An Examination of Hume's Essay on Justice (1793), anonymous [text|rtf]
- Hume on Miracles (1794), William Paley [text|rtf]
- On... the Origin of the Idea of Necessary Connection (1797), H. Richter [text|rtf]
- David Hume (1875), James McCosh

Early Biographies of David Hume

The first substantial biography of Hume was Thomas Edward Ritchie's 520 page *An account of the life and writings of David Hume, Esq.* (1807). However, as early as 1762 biographical essays on Hume appeared in magazines, reference books, and personal memoirs. The essays below include critical discussions of Hume's life as well as historical accounts.

- David Hume (1762), William Rider [text|rtf]
- An Account of the Life and Writings of David Hume (1776), anonymous [text|rtf]
- Strictures on the "Account of the Life... of David Hume" (1777), "Tobias Simple" [text|rtf]
- Letter from Adam Smith, LL.D. to William Strahan, Esq. (1777), Adam Smith [text|rtf]
- Letter to Adam Smith (1777), George Horne [text|rtf]
- Supplement to the Life of David Hume, Esq. (1777), S.J. Pratt [text|rtf]
- David Hume (a. 1799), James Caulfield [text|rtf]
- Anecdotes of David Hume (a. 1800), Alexander Carlyle [text|rtf]
- The Life of David Hume, Esq. (1800), William Smellie [text|rtf]

More About the Hume Archives

The Hume Archives is administrated by Jim Fieser (*jfieser@utm.edu*) at The University of Tennessee at Martin. To accommodate the widest range of internet users, Hume Archives text files are available in HTML, Text, and RFT formats. These files are introduced with the following copyright statement:

The Will To Believe
William James
1897

The Will To Believe[2]

In the recently published Life by Leslie Stephen of I his brother, Fitz-James, there is an account of a school to which the latter went when he was a boy. The teacher, a certain Mr. Guest, used to converse with his pupils in this wise: "Gurney, what is the difference between justification and sanctification? Stephen, prove the omnipotence of God!" etc. In the midst of our Harvard freethinking and indifference we are prone to imagine that here at your good old orthodox College conversation continues to be somewhat upon this order; and to show you that we at Harvard have not lost all interest in these vital subjects, I have brought with me to-night something like a sermon on justification by faith to read to you, -- I mean an essay in justification of faith, a defense of our right to adopt a believing attitude in religious matters, in spite of the fact that our merely logical intellect may not have been coerced. I The Will to Believe,' accordingly, is the title of my paper.

I have long defended to my own students the lawfulness of voluntarily adopted faith; but as soon as they have got well imbued with the logical spirit, they have as a rule refused to admit my contention I to be lawful philosophically, even though in point of fact they were personally all the time chock-full of some faith or other themselves. I am all the while, however, so profoundly convinced that my own position is correct, that your invitation has seemed to me a good occasion to make my statements more clear. Perhaps your minds will be more open than those with which I have hitherto had to deal, I will be as little technical as I can, though I must begin by setting up some technical distinctions that will help us in the end.

1. Hypotheses and Options. Let us give the name of *hypothesis* to anything that

may be proposed to our belief; and just as the electricians speak of live and dead wires, let us speak of any hypothesis as either *live* or *dead*. A live hypothesis is one which appeals as a real possibility to him to whom it is proposed. If I asked you to believe in the Mahdi, the notion makes no electric connection with your nature, -- it refuses to scintillate with any credibility at all. As an hypothesis it is completely dead. To an Arab, however (even if he be not one of the Mahdi's followers), the hypothesis is among the mind's possibilities: it is alive. This shows that deadness and liveness in an hypothesis are not intrinsic properties, but relations to the individual thinker. They are measured

by his willingness to act. The maximum of liveness in an hypothesis , means willingness to act irrevocably. Practically, that means belief; but there is some believing tendency wherever there is willingness to act at all.

Next, let us call the decision between two hypotheses an *option*. Options may be of several kinds. They may be -- 1. *living* or *dead*; 2. *forced* or *avoidable*; 3, *momentous* or *trivial*; and for our purposes we may call an option a genuine option when it is of the forced, living, and momentous kind.

1. A living option is one in which both hypotheses are live ones. If I say to you: "Be a theosophist or be a Mohammedan," it is probably a dead option, because for you neither hypothesis is likely to be alive. But if I say: " Be an agnostic or be a Christian," it is otherwise: trained as you are, each hypothesis makes some appeal, however small, to your belief.

2. Next, if I say to you: "Choose between going out with your umbrella or without it," I do not offer you a genuine option, for it is not forced. You can easily avoid it by not going out at all. Similarly, if I say, "Either love me or hate me," "Either call my theory true or call it false," your option is avoidable. You may remain indifferent to me, neither loving nor hating, and you may decline to offer any judgment as to my theory. But if I say, "Either accept this truth or go without it," I put on you a forced option, for there is no standing place outside of the alternative. Every dilemma based on a complete logical disjunction, with no possibility of not choosing, is an option of this forced kind.

3. Finally, if I were Dr. Nansen and proposed to you to join my North Pole expedition, your option would be momentous; for this would probably be your only similar opportunity, and your choice now would either exclude you from the North Pole sort of immortality altogether or put at least the chance of it into your hands. He who refuses to embrace a unique opportunity loses the prize as surely as if he tried and failed. *Per contra*, the option is trivial when the opportunity is not unique, when the stake is insignificant, or when the decision is reversible if it later prove unwise. Such trivial options abound in the scientific life. A chemist finds an hypothesis live enough to spend a year in its verification: he believes in it to that extent. But if his experiments prove inconclusive either way, he is quit for his loss of time, no vital harm being done.

It will facilitate our discussion if we keep all these distinctions well in mind.

2. Pascal's Wager. The next matter to consider is the actual psychology of human opinion. When we look at certain facts, it seems as if our passional and volitional nature lay at the root of all our convictions. When we look at others, it seems as if they could do nothing when the intellect had once said its say. Let us take the latter facts up first

Does it not seem preposterous on the very face of it to talk of our opinions being modifiable at will? Can our will either help or hinder our 'intellect in its perceptions of truth? Can we, by just willing it, believe that Abraham Lincoln's existence is a myth, and that the portraits of him in McClure's Magazine are all of some one else? Can we, by any effort of our will, or by any strength of wish that it were true, believe ourselves well and about when we are roaring with rheumatism in bed, or feel certain that the sum of the two one-dollar bills in our pocket must be a hundred dollars? We can *say* any of these things, but we are absolutely impotent to believe them; and of just such things is the whole fabric of the truths that we do believe in made up, -- matters of fact, immediate or remote, as Hume said, and relations between ideas, which are either there or not there for us if we see them so, and which if not there cannot be put there by any action of our own.

In Pascal's Thoughts there is a celebrated passage known in literature as Pascal's wager. In it he

tries to force us into Christianity by reasoning as if our concern with truth resembled our concern with the stakes in a game of chance. Translated freely his words are these: You must either believe or not believe that God is -- which will you do? Your human reason cannot say. A game is going on between you and the nature of 'things which at the day of judgment will bring out either heads or tails. Weigh what your gains and your losses would be if you should stake all you have on heads, or God's existence: if you win in such case, you gain eternal beatitude; if you lose, you lose nothing at all. If there were an infinity of chances, and only one for God in this wager, still you ought to stake your all. on God; for though you surely risk a finite loss by this procedure, any finite loss is reasonable, even a certain one is reasonable, if there is but the possibility of infinite gain. Go, then, and take holy water, and have masses said; belief will come and stupefy your scruples, -- *Cela vous fera croire et vous abltira*. Why should you not? At bottom, what have you to lose?

You probably feel that when religious faith expresses itself thus, in the language of the gamingtable, it is put to its last trumps. Surely Pascal's own personal belief in masses and holy water had far other springs; and this celebrated page of his is but an argument for others, a last desperate snatch at a weapon against the hardness of the unbelieving heart. We feel that a faith in masses and holy water adopted willfully after such a mechanical calculation -- would lack the inner soul of faith's reality; and if we were ourselves in the place of the Deity, we should probably take particular pleasure in cutting off believers of this pattern from their infinite reward. It is evident that unless there be some pre-existing tendency to believe in masses and holy water, the option offered to 'the will by Pascal is not a living option. Certainly no Turk ever took to masses and holy water on its account; and even to us Protestants these means of salvation seem such foregone impossibilities that Pascal's logic, invoked for them specifically, leaves us unmoved. As well might the Mahdi write to us, saying, "I am the Expected One whom God has created in his effulgence. You shall be infinitely happy if you confess me; otherwise you shall be cut off from the light of the sun. Weigh, then, your infinite gain if I am genuine against your finite sacrifice if I am not! " His logic would be that of Pascal; but he would vainly use it on us, for the hypothesis he offers us is dead. No tendency to act on it exists in us to any degree.

The talk of believing by our volition seems, then, from one point of view, simply silly. From another point of view it is worse than silly, it is vile. When one turns to the magnificent edifice of the physical sciences, and sees how it was reared; what thousands of disinterested moral lives of men lie buried in its mere foundations; what patience and postponement, what choking down of preference, what submission to the icy laws of outer fact are wrought into its very stones and mortar; how absolutely impersonal it stands in its vast augustness, -- then how besotted and contemptible seems every little sentimentalist who comes blowing his voluntary smoke-wreaths, and pretending to decide things from out of his private dream! Can we wonder if those bred in the rugged and manly school of science should feel like spewing such subjectivism out of their mouths? The whole system of loyalties which grow up in the schools of science go dead against its toleration; so that it is only natural that those who have caught the scientific fever should pass over to the opposite extreme, and write sometimes as if the incorruptibly truthful intellect ought positively to prefer bitterness and unacceptableness to the heart in its cup.

It fortifies my soul to know

That, though I perish, Truth is so --

sings Clough, while Huxley exclaims: "My only consolation lies in the reflection that, however bad our posterity may become, so far as they hold by the plain rule of not pretending to believe what

they have no reason to believe, because it may be to their advantage so to pretend the word ' pretend' is surely here redundant, they will not have reached the lowest depth of immorality." And that delicious *enfant terrible* Clifford writes: " Belief is desecrated when given to unproved and unquestioned statements for the solace and private pleasure of the believer. . . . Whoso would deserve well of his fellows in this matter will guard the purity of his belief with a very fanaticism of jealous care, lest at any time it should rest on an unworthy object, and catch a stain which can never be wiped away. . . . If a belief has been accepted on insufficient evidence even though the belief be true, as Clifford on the same page explains the pleasure is a stolen one. . . . It is sinful because it is stolen in defiance of our duty to mankind. That duty is to guard ourselves from such beliefs as from a pestilence which may shortly master our own body and then spread to the rest of the town. . . . It is ,wrong always, everywhere, and for every one, to believe anything upon insufficient evidence."

3. Clifford's Veto, Psychological Causes of Belief. All this strikes one as healthy, even when expressed, as by Clifford, with somewhat too much of robustious pathos in the voice.,; Free-will and simple wishing do seem, in the matter of our credences, to be only fifth wheels to the coach. Yet if any one should thereupon assume that intellectual insight is what remains after wish and will and sentimental preference have taken wing, or that pure reason is what then settles our opinions, he would fly quite as directly in the teeth of the facts.

It is only our already dead hypotheses that our willing nature is unable to bring to life again But what has made them dead for us is for the most part a previous action of our willing nature of an antagonistic kind. When I say 'willing nature,' I do not mean only such deliberate volitions as may have set up habits of belief that we cannot now escape from, I mean all such factors of belief as fear and hope, prejudice and passion, imitation and partisanship, the circumpressure of our caste and set. As a matter of fact we find ourselves believing, we hardly know how or why. Mr. Balfour gives the name of authority' to all those influences, born of the intellectual climate, that make hypotheses possible or impossible for us, alive or dead. Here in this room, we all of us believe in molecules and the conservation of energy, in democracy and necessary progress, in Protestant Christianity and the duty of fighting for 'the doctrine of the immortal Monroe,' all for no reasons worthy of the name. We see into these matters with no more inner clearness,. and probably with much less, than any disbeliever in them might possess. His unconventionality would probably have some grounds to show for its conclusions; but for us, not insight, but the *prestige* of the opinions, is what makes the spark shoot from them and light up our sleeping magazines of faith. Our reason is quite satisfied, in nine hundred and ninety-nine cases out of every thousand of us, if it can find a few arguments that will do to recite in case our credulity is criticized by some one else. Our faith is faith in some one else's faith, and in the greatest matters this is most the case. Our belief in truth itself, for instance, that there is a truth, and that our minds and it are made for each other, -- what is it but a passionate affirmation of desire, in which our social system backs us up? We want to have a truth; we want to believe that our experiments and studies and discussions must put us in a continually better and better position towards it; and on this line we agree to fight out our thinking lives. But if a pyrrhonistic skeptic asks us *how we know* all this, can our logic find a reply? No! certainly it cannot. It is just one volition against another, -- we willing to go in for life upon a trust or assumption which he, for his part, does not care to make.[3]

As a rule we disbelieve all facts and theories for which we have no use. Clifford's cosmic emotions find no use for Christian feelings. Huxley belabors the bishops because there is no use for sacerdotalism in his scheme of life. Newman, on the contrary, goes over to Romanism, and finds all

sorts of reasons good for staying there, because a priestly system is for him an organic need and delight. Why do so few "scientists" even look at the evidence for telepathy, so-called? Because they think, as a leading biologist, now dead, once said to me, that even if such a thing were true, scientists ought to band together to keep it suppressed and concealed. It would undo the uniformity of Nature and all sorts of other things without which scientists cannot carry on their pursuits. But if this very man had been shown something which as a scientist he might *do* with telepathy, he might not only have examined the evidence, but even have found it good enough. This very law which the logicians would impose upon us -- if I may give the name of logicians to those who would rule out our willing nature here -- is based on nothing but their own natural wish to exclude all elements form which they, in their professional quality of logicians, can find no use.

Evidently, then, our non-intellectual nature does influence our convictions. There are passional tendencies and volitions which run before and others which come after belief, and it is only the latter that are too late for the fair; and they are not too late when the previous passional work has been already in their own direction. Pascal's argument, instead of being powerless, then seems a regular clincher, and is the last stroke needed to make our faith in masses and holy water complete. The state of things is evidently far from simple; and pure insight and logic, whatever they might do ideally, are not the only things that really do produce our creeds.

4. Thesis of the Essay. Our next duty, having recognized this mixed-up state of affairs, is to ask whether it be simply reprehensible and pathological, or whether, on the contrary, we must treat it as a normal element in making up our minds. The thesis I defend is, briefly stated, this: *Our passional nature not only lawfully may, but must, decide an o option between propositions, whenever it is a genuine option that cannot by its nature be decided on intellectual grounds ; for to say, under such circumstances, " Do not decide, but leave the question open," is itself a passional decision, -- just like deciding yes or no, -- and is attended with the same risk of losing the truth.* The thesis thus abstractly expressed will, I trust, soon become quite clear. But I must first indulge in a bit more of preliminary work.

5. Empiricism and Absolutism. It will be observed that for the purposes of this discussion we are on 'dogmatic ' ground, -- ground, I mean, which leaves systematic philosophical skepticism altogether out of account. The postulate that there is truth, and that it is the destiny of our minds to attain it, we are deliberately resolving to make, though the skeptic will not make it. We part company with him, therefore, absolutely, at this point. But the faith that truth exists, and that our minds can find it, may be held in two ways. We may talk of the *empiricist* way and of the *absolutist* way of believing in truth. The absolutists in this matter say that we not only can attain to knowing truth, but we can *know* when we have attained to knowing it; while the empiricists think that although we may attain it, we cannot infallibly know when. To *know* is one thing, and to know for certain *that* we know is another. One may hold to the first being possible without the second; hence the empiricists and the absolutists, although neither of them is a skeptic in the usual philosophic sense of the term, show very different degrees of dogmatism in their lives.

If we look at the history of opinions, we see that the empiricist tendency has largely prevailed in science, while in philosophy the absolutist tendency has had everything its own way. The characteristic sort of happiness, indeed, which philosophies yield has mainly consisted in the conviction felt by each successive school or system that by it bottom-certitude had been attained. "Other philosophies are collections of opinions, mostly false; *my* philosophy gives standing-ground forever," -- who does not recognize in this the key-note of every system worthy of the name? A system, to be a system at all, must come as a *closed* system, reversible in this or that detail,

perchance, but in its essential features never!

Scholastic orthodoxy, to which one must always go when one wishes to find perfectly clear statement, has beautifully elaborated this absolutist conviction in a doctrine which it calls that of ' objective evidence.' If, for example, I am unable to doubt that I now exist before you, that two is less than three, or that if all men are mortal then I am mortal too, it is because these things illumine my intellect irresistibly. The final ground of this objective evidence possessed by certain propositions is the *adaequatio intellectus nostri cum re*. The certitude it brings involves an *apititudinem ad extorquendum certum assensum* on the part of the truth envisaged, and on the side of the subject a *quietem in cognitione*, when once the object is mentally received, that leaves no possibility of doubt behind; and in the whole transaction nothing operates but the *entitas ipsa* of the object and the *entitas ipsa* of the mind. We slouchy modern thinkers dislike to talk in Latin, -- indeed, we dislike to talk in set terms at all; but at bottom our own state of mind is very much like this whenever we uncritically abandon ourselves: You believe in objective evidence, and I do. Of some things we feel that we are certain: we know, and we know that we do know. There is something that gives a click inside of us, a bell that strikes twelve, when the hands of our mental clock have swept the dial and meet over the meridian hour. The greatest empiricists among us are only empiricists on reflection: when left to their instincts, they dogmatize like infallible popes. When the Cliffords tell us how sinful it is to be Christians on such 'insufficient evidence,' insufficiency is really the last thing they have in mind. For them the evidence is absolutely sufficient, only it makes the other way. They believe so completely in an anti-Christian order of the universe that there is no living option: Christianity is a dead hypothesis from the start.

6. Objective Certitude and its Unattainability. But now, since we are all such absolutists by instinct, what in our quality of students of philosophy ought we to do about the fact? Shall we espouse and endorse it? Or shall we treat it as a weakness of our nature from which we must free ourselves, if we can?

I sincerely believe that the latter course is the only one we can follow as reflective men. Objective evidence and certitude are doubtless very fine ideals to play with, but where on this moonlit and dream-visited planet are they found? I am, therefore, myself a complete empiricist so far as my theory of human knowledge goes. I live, to be sure, by the practical faith that we must go on experiencing and thinking over our experience, for only thus can our opinions grow more true; but to hold any one of them -- I absolutely do not care which -- as if it never could be reinterpretable or corrigible, I believe to be a tremendously mistaken attitude, and I think that the whole history of philosophy will bear me out. There is but one indefectibly certain truth, and that is the truth that pyrrhonistic skepticism itself leaves standing, -- the truth that the present phenomenon of consciousness exists. That, however, is the bare starting-point of knowledge, the mere admission of a stuff to be philosophized about. The various philosophies are but so many attempts at expressing what this stuff really is. And if we repair to our libraries what disagreement do we discover! Where is a certainly true answer found? Apart from abstract propositions of comparison (such as two and two are the same as four), propositions which tell us nothing by themselves about concrete reality, we find no proposition ever regarded by any one as evidently certain that has not either been called a falsehood, or at least had its truth sincerely questioned by some one else. The transcending of the axioms of geometry, not in play but in earnest, by certain of our contemporaries (as Zollner and Charles H. Hinton), and the rejection of the whole Aristotelian logic by the Hegelians, are striking instances in point.

No concrete test of what is really true has ever been agreed upon. Some make the criterion external

to the moment of perception, putting it either in revelation, the *consensus gentium,* the instincts of the heart, or the systematized experience of the race. Others make the perceptive moment its own test, Descartes, for instance, with his clear and distinct ideas guaranteed by the veracity of God; Reid with his 'common-sense;' and Kant with his forms of synthetic judgment *a priori*. The inconceivability of the opposite; the capacity to be verified by sense; the possession of complete organic unity or self-relation, realized when a thing is its own other, -- are standards which, in turn, have been used, The much lauded objective evidence is never triumphantly there; it is a mere aspiration or *Grenzbegriff,* marking the infinitely remote ideal of our thinking life. To claim that certain truths now possess it, is simply to say that when you think them true and they *are* true, then their evidence is objective, otherwise it is not. But practically one's conviction that the evidence one goes by is of the real objective brand, is only one more subjective opinion added to the lot. For what a contradictory array of opinions have objective evidence and absolute certitude been claimed! The world is rational through and through, -- its existence is an ultimate brute fact; there is a personal God, -- a personal God is inconceivable; there is an extra-mental physical world immediately known, -- the mind can only know its own ideas; a moral imperative exists, -- obligation is only the resultant of desires; a permanent spiritual principle is in every one, -- there are only shifting states of mind; there is an endless chain of causes, -- there is an absolute first cause; an eternal necessity, -- a freedom; a purpose, -- no purpose; a primal One, -- a primal Many; a universal continuity, -- an essential discontinuity in things; an infinity, -- no infinity. There is this, -- there is that; there is indeed nothing which some one has not thought absolutely true, while his neighbor deemed it absolutely false; and not an absolutist among them seems ever to have considered that the trouble may all the time be essential, and that the intellect, even with truth directly in its grasp, may have no infallible signal for knowing whether it be truth or no. When, indeed, one remembers that the most striking practical application to life of the doctrine of objective certitude has been the conscientious labors of the Holy Office of the Inquisition, one feels less tempted than ever to lend the doctrine a respectful ear.

But please observe, now, that when as empiricists we give up the doctrine of objective certitude, we do not thereby give up the quest or hope of truth itself. We still pin our faith on its existence, and still believe that we gain an ever better position towards it by systematically continuing to roll up experiences and think. Our great difference from the scholastic lies in the way we face. The strength of his system lies in the principles, the origin, the *terminus a quo* of his thought; for us the strength is in the outcome, the upshot, the *terminus ad quem*. Not where it comes from but what it leads to is to decide. It, matters not to an empiricist from what quarter an hypothesis may come to him: he may have acquired it by fair means or by foul; passion may have whispered or accident suggested it; but if the total drift of thinking continues to confirm it, that is what he means b its being true.

7. Two Different Sorts of Risks in Believing. One more point, small but important, and our preliminaries are done. There are two ways of looking at our duty in the. matter of opinion, -- ways entirely different, and yet ways about whose difference the theory of knowledge seems hitherto to have shown very little concern. *We must know the truth*; and *we must avoid error*, -- these are our first and great commandments as would-be knowers; but they are not two ways of stating an identical commandment, they are two separable laws. Although it may indeed happen that when we believe the truth A, we escape as an incidental consequence from believing the falsehood B, it hardly ever happens that by merely disbelieving B we necessarily believe A. We may in escaping B fall into believing other falsehoods, C or D, just as bad as B; or we may escape B by not believing

anything at all not even A. Believe truth! Shun error -- these, we see, are two materially different laws; and by choosing between them we may end by coloring differently our whole intellectual life. We may regard the chase for truth as paramount, and the avoidance of error as secondary; or we may, on the other hand, treat the avoidance of error as more imperative, and let truth take its chance. Clifford, in the instructive passage which I have quoted, exhorts us to the latter course. Believe nothing, he tells us, keep your mind in suspense forever', rather than by closing it on insufficient evidence incur the awful risk of believing lies. You, on the other hand, may think that the risk Of being in error is a very small matter when compared with the blessings of real knowledge, and be ready to be duped many times in your investigation rather than postpone indefinitely the chance of guessing true. I myself find it impossible to go with Clifford. We must remember that these feelings of our duty about either truth or error are in any case only expressions of our passional life. Biologically considered, our minds are as ready to grind out falsehood as veracity, and he who says, "Better go without belief forever than believe a lie!" merely shows his own preponderant private horror of becoming a dupe. He may be critical of many of his desires and fears, but this fear he slavishly obeys. He cannot imagine any one questioning its binding force. For my own part, I have also a horror of being duped; but I can believe that worse things than being duped may happen to a man in this world: so Clifford's exhortation has to my ears a thoroughly fantastic sound. It is like a general informing his soldiers that it is better to keep out of battle forever than to risk a single wound. Not so are victories either over enemies or over nature gained. Our errors are surely not such awfully solemn things. In a world where we are so certain to incur them in spite of all our caution, a certain lightness of heart seems healthier than this excessive nervousness on their behalf At any rate, it seems the fittest thing for the empiricist philosopher.

8. Some Risk Unavoidable. And now, after all this introduction, let us go straight at our question. I have said, and now repeat it, that not only as a matter of fact do we find our passional nature influencing us in our opinions, but that there are some options between opinions in which this influence must be regarded both as an inevitable and as a lawful determinant of our choice.

I fear here that some of you my hearers will begin to scent danger, and lend an inhospitable ear. Two first steps of passion you have indeed had to admit as necessary, -- we must think so as to avoid dupery, and -- we must think so as to gain truth; but the surest path to those ideal consummations, you will probably consider, is from now onwards to take no further passional step.

Well, of course, I agree as far as the facts will allow. Wherever the option between losing truth and gaining it is not momentous, we can throw the chance of *gaining truth* away, and at any rate save ourselves from any chance of *believing falsehood*, by not making up our minds at all till objective evidence has come. In scientific questions, this is almost always the case; and even in human affairs in general, the need of acting is seldom so urgent that a false belief to act on is better than no belief at all. Law courts, indeed, have to decide on the best evidence attainable for the moment, because a judge's duty is to make law as well as to ascertain it, and (as a learned judge once said to me) few cases are worth spending much time over: the great thing is to have them decided on any acceptable principle, and got out of the way. But in our dealings with objective nature we obviously are recorders, not makers, of the truth; and decisions for the mere sake of deciding promptly and getting on to the next business would be wholly out of place. Throughout the breadth of physical nature facts are what they are quite independently of us, and seldom is there any such hurry about them that the risks of being duped by believing a premature theory need be faced. The questions here are always trivial options, the hypotheses are hardly living (at any rate not living for us

spectators), the choice between believing truth or falsehood is seldom forced. The attitude of skeptical balance is therefore the absolutely wise one if we would escape mistakes. What difference, indeed, does it make to most of us whether we have or have not a theory of the Rontgen rays, whether we believe or not in mind-stuff, or have a conviction about the causality of conscious states? It makes no difference. Such options are not forced on us. On every account it is better not to make them, but still keep weighing reasons Pro *et contra* with an indifferent hand.

I speak, of course, here of the purely judging mind. For purposes of discovery such indifference is to be less highly recommended, and science would be far less advanced than she is if the passionate desires of individuals to get their own faiths confirmed had been kept out of the game. See for example the sagacity which Spencer and Weismann now display. On the other hand, if you want an absolute duffer in an investigation, you must, after all, take the man who has no interest whatever in its results: he is the warranted incapable, the positive fool. The most useful investigator, because the most sensitive observer, is always he whose eager interest in one side of the question is balanced by an equally keen nervousness lest he become deceived.[4] Science has organized this nervousness into a regular *technique*, her so-called method of verification; and she has fallen so deeply in love with the method that one may even say she has ceased to care for truth by itself at all. It is only truth as technically verified that interests her. The truth of truths might come in merely affirmative form, and she would decline to touch it. Such truth as that, she might repeat with Clifford, would be stolen in defiance of her duty to mankind. Human passions, however, are stronger than technical rules. " Le coeur a ses raisons," as Pascal says, " que la raison ne connait pas;" and however indifferent to all but the bare rules of the game the umpire, the abstract intellect, may be, the concrete players who furnish him the materials to judge of are usually, each one of them, in love with some pet 'live hypothesis' of his own. Let us agree, however, that wherever there is no forced option, the dispassionately judicial intellect with no pet hypothesis, saving us, as it does, from dupery at any rate, ought to be our ideal.

The question next arises: Are there not somewhere forced options in our speculative questions, and can we (as men who may be interested at least as much in positively gaining truth as in merely escaping dupery) always wait with impunity till the coercive evidence shall have arrived? It seems *a priori* improbable that the truth should be so nicely adjusted to our needs and powers as that. In the great boarding-house of nature, the cakes and the butter and the syrup seldom come out so even and leave the plates so clean. Indeed, we should view them with scientific suspicion if they did.

9. Faith May Bring Forth its Own Verification. *Moral questions* immediately present themselves as questions whose solution cannot wait for sensible proof. A moral question is a question not of what sensibly exists, but of what is good, or would be good if it did exist. Science can tell us what exists; but to compare the *worths*, both of what exists and of what does not exist, we must consult not science, but what Pascal calls our heart. Science herself consults her heart when she lays it down that the infinite ascertainment of fact and correction of false belief are the supreme goods for man. Challenge the statement, and science can only repeat it oracularly, or else prove it by showing that such ascertainment and correction bring man all sorts of other goods which man's heart in turn declares. The question of having moral beliefs at all or not having them is decided by our will. Are our moral preferences true or false, or are they only odd biological phenomena, making things good or bad for *us*, but in themselves indifferent? How can your pure intellect decide? If your heart does not *want* a world of moral reality, your head will assuredly never make you believe in one. Mephistophelian skepticism, indeed, will satisfy the head's play-instincts much better than any rigorous idealism can. Some men (even at the student age) are so naturally cool-hearted that the

moralistic hypothesis never has for them any pungent life, and in their supercilious presence the hot young moralist always feels strangely ill at ease. The appearance of knowingness is on their side, of *naivet,* and gullibility on his. Yet, in the inarticulate heart of him, he clings to it that he is not a dupe, and that there is a realm in which (as Emerson says) all their wit and intellectual superiority is no better than the cunning of a fox. Moral skepticism can no more be refuted or proved by logic than intellectual skepticism can. When we stick to it that there *is* truth (be it of either kind), we do so with our whole nature, and resolve to stand or fall by the results. The skeptic with his whole nature adopts the doubting attitude; but which of us is the wiser, Omniscience only knows.

Turn now from these wide questions of good to a certain class of questions of fact, questions concerning personal relations, states of mind between one man and another. *Do you like me or not?* -- for example. Whether you do or not depends, in countless instances, on whether I meet you half-way, am willing to assume that you must like me, and show you trust and expectation. The previous faith on my part in your liking's existence is in such cases what makes your liking come. But if I stand aloof, and refuse to budge an inch until I have objective evidence, until you shall have done something apt, as the absolutists say, *ad extorquendum assensum meum*, ten to one your liking never comes. How many women's hearts are vanquished by the mere sanguine insistence of some man that they *must* love him! he will not consent to the hypothesis that they cannot. The desire for a certain kind of truth here brings about that special truth's existence; and so it is in innumerable cases of other sorts. Who gains promotions, boons, appointments, but the man in whose life they are seen to play the part of live hypotheses, who discounts them, sacrifices other things for their sake before they have come, and takes risks for them in advance? His faith acts on the powers above him as a claim, and creates its own verification.

A social organism of any sort whatever, large or small, is what it is because each member proceeds to his own duty with a trust that the other members will simultaneously do theirs. Wherever a desired result is achieved by the co-operation of many independent persons, its existence as a fact is a pure consequence of the precursive faith in one another of those immediately concerned. A government, an army, a commercial system, a ship, a college, an athletic team, all exist on this condition, without which not only is nothing achieved, but nothing is even attempted. A whole train of passengers (individually brave enough) will be looted by a few highwaymen, simply because the latter can count on one another, while each passenger fears that if he makes a movement of resistance, he will be shot before any one else backs him up. If we believed that the whole car-full would rise at once with us, we should each severally rise, and train-robbing would never even be attempted. There are, then, cases where a fact cannot come at all unless a preliminary faith exists in its coming. *And where faith in a fact can help create the fact*, that would be an insane logic which should say that faith running ahead of scientific evidence is the 'lowest kind of immorality' into which a thinking being can fall. Yet such is the logic by which our scientific absolutists pretend to regulate our lives!

10. Logical Conditions of Religious Belief. In truths dependent on our personal action, then, faith based on desire is certainly a lawful and possibly an indispensable thing.

But now, it will be said, these are all childish human cases, and have nothing to do with great cosmical matters, like the question of religious faith. Let us then pass on to that. Religions differ so much in their accidents that in discussing the religious question we must make it very generic and broad. What then do we now mean by the religious hypothesis? Science says things are; morality says some things are better than other things; and religion says essentially two things.

First, she says that the best things are the more eternal things, the overlapping things, the things in the universe that throw the last stone, so to speak, and say the final word. " Perfection is eternal," this phrase of Charles Secretan seems a good way of putting this first affirmation of religion, an affirmation which obviously cannot yet be verified scientifically at all.

The second affirmation of religion is that we are better off even now if we believe her first affirmation to be true.

Now, let us consider what the logical elements of this situation are *in case the religious hypothesis in both its branches be really true*. (Of course, we must admit that possibility at the outset. If we are to discuss the question at all, it must involve a living option. If for any of you religion be a hypothesis that cannot, by any living possibility be true, then you need go no farther. I speak to the 'saving remnant' alone.) So proceeding, we see, first, that religion offers itself as a *momentous* option. We are supposed to gain, even now, by our belief, and to lose by our nonbelief, a certain vital good. Secondly, religion is a *forced* option, so far as that good goes. We cannot escape the issue by remaining skeptical and waiting for more light, because, although we do avoid error in that way *if religion be untrue*, we lose the good, *if it be true*, just as certainly as if we positively chose to disbelieve. It is as if a man should hesitate indefinitely to ask a certain woman to marry him because he was not perfectly sure that she would prove an angel after he brought her home. Would he not cut himself off from that particular angel-possibility as decisively as if he went and married some one else? Skepticism, then, is not avoidance of option; it is option of a certain particular kind of risk. *Better risk loss of truth than chance of error*, -- that is' your faith-vetoer's exact position. He is actively playing his stake as much as the believer is; he is backing the field against the religious hypothesis, just as the believer is backing the religious hypothesis against the field. To preach skepticism to us as a duty until 'sufficient evidence' for religion be found, is tantamount therefore to telling us, when in presence of the religious hypothesis, that to yield to our fear of its being error is wiser and better than to yield to our hope that it may be true. It is not intellect against all passions, then; it is only intellect with one passion laying down its law. And by what, forsooth, is the supreme wisdom of this passion warranted? Dupery for dupery, what proof is there that dupery through hope is so much worse than dupery through fear? I, for one, can see no proof; and I simply refuse obedience to the scientist's command to imitate his kind of option, in a case where my own stake is important enough to give me the right to choose my own form of risk. If religion be true and the evidence for it be still insufficient, I do not wish, by putting your extinguisher upon my nature (which feels to me as if it had after all some business in this matter), to forfeit my sole chance in life of getting upon the winning side, -- that chance depending, of course, on my willingness to run the risk of acting as if my passional need of taking the world religiously might be prophetic and right.

All this is on the supposition that it really may be prophetic and right, and that, even to us who are discussing the matter, religion is a live hypothesis which may be true. Now, to most of us religion comes in a still further way that makes a veto on our active faith even more illogical. The more perfect and more eternal aspect of the universe is represented in our religions as having personal form. The universe is no longer a mere *It* to us, but a *Thou,* if we are religious; and any relation that may be possible from person to person might be possible here. For instance, although in one sense we are passive portions of the universe, in another we show a curious autonomy, as if we were small active centers on our own account. We feel, too, as if the appeal of religion to us were made to our own active good-will, as if evidence might be forever withheld from us unless we met the hypothesis half-way. To take a trivial illustration: just as a man who in a company of

gentlemen made no advances, asked a warrant for every concession, and believed no one's word without proof, would cut himself off by such churlishness from all the social rewards that a more trusting spirit would earn, -- so here, one who should shut himself up in snarling logicality and try to make the gods extort his recognition willy-nilly, or not get it at all, might cut himself off forever from his only opportunity of making the gods' acquaintance. This feeling, forced on us we know not whence, that by obstinately believing that there are gods (although not to do so would be so easy both for our logic and our life) we are doing the universe the deepest service we can, seems part of the living essence of the religious hypothesis. If the hypothesis *were* true in all its parts, including this one, then pure intellectualism, with its veto on our making willing advances, would be an absurdity; and some participation of our sympathetic nature would be logically required. I, therefore, for one, cannot see my way to accepting the agnostic rules for truth-seeking, or willfully agree to keep my willing nature out of the game. I cannot do so for this plain reason, that *a rule of thinking which would absolutely prevent me from acknowledging certain kinds of truth if those kinds of truth were really there, would be an irrational rule*. That for me is the long and short of the formal logic of the situation, no matter what the kinds of truth might materially be.

I confess I do not see how this logic can be escaped. But sad experience makes me fear that some of you may still shrink from radically saying with me, *in abstractor* that we have the right to believe at our own risk any hypothesis that is live enough to tempt our will. I suspect, however, that if this is so, it is because you have got away from the abstract logical point of view altogether, and are thinking (perhaps without realizing it) of some particular religious hypothesis which for you is dead. The freedom to 'believe what we will' you apply to the case of some patent superstition; and the faith you think of is the faith defined by the schoolboy when he said, " Faith is when you believe something that you know ain't true." I can only repeat that this is misapprehension. *In concreto*, the freedom to believe can only cover living options which the intellect of the individual cannot by itself resolve; and living options never seem absurdities to him who has them to consider. When I look at the religious question as it really puts itself to concrete men, and when I think of all the possibilities which both practically and theoretically it involves, then this command that we shall put a stopper on our heart, instincts, and courage, and *wait* -- acting of course meanwhile more or less as if religion were *not* true[5] -- till doomsday, or till such time as our intellect and senses working together may have raked in evidence enough, -- this command, I say, seems to me the queerest idol ever manufactured in the philosophic cave. Were we scholastic absolutists, there might be more excuse. If we had an infallible intellect with its objective certitudes, we might feel ourselves disloyal to such a perfect organ of knowledge in not trusting to it exclusively, in not waiting for its releasing word. But if we are empiricists, if we believe that no bell in us tolls to let us know for certain when truth is in our grasp, then it seems a piece of idle fantasticality to preach so solemnly our duty of waiting for the bell. Indeed we *may* wait if we will, -- I hope you do not think that I am denying that, -- but if we do so, we do so at our peril as much as if we believed. In either case we *act*, taking our life in our hands. No one of us ought to issue vetoes to the other, nor should we bandy words of abuse. We ought, on the contrary, delicately and profoundly to respect one another's mental freedom: then only shall we bring about the intellectual republic; then only shall we have that spirit of inner tolerance without which all our outer tolerance is soulless, and which is empiricism's glory; then only shall we live and let live, in speculative as well as in practical things.

I began by a reference to Fitz James Stephen; let me end by a quotation from him. " What do you think of yourself? What do you think of the world? . . . These are questions with which all must deal as it seems good to them. They are riddles of the Sphinx, in some way or other we must deal

with them... In all important transactions of life we have to a leap in the dark. . . . If we decide to leave the riddles unanswered, that is a choice; if we waver in our answer, that, too, is a choice: but whatever choice we make, we make it at our peril. If a man chooses to turn his back altogether on God and the future, no one can prevent him; no one can show beyond reasonable doubt that he is mistaken. If a man thinks otherwise and acts as he thinks, I do not see that any one can prove that *he* is mistaken. Each must act as he thinks best; and if he is wrong, so much the worse for him. We stand on a mountain pass in the midst of whirling snow and blinding mist, through which we get glimpses now and then of paths which may be deceptive. If we stand still we shall be frozen to death. If we take the wrong road we shall be dashed to pieces. We do not certainly know whether there is any right one. What must we do? "Be strong and of a good courage." Act for the best, hope for the best, and take what comes. . . . If death ends all, we cannot meet death better."[6]

5 Since belief is measured by action, he who forbids us to believe religion to be true, necessarily also forbids us to act as we should if we did believe it to be true. The whole defense of religious faith hinges upon action. If the action required or inspired by the religious hypothesis is in no way different from that dictated by the naturalistic hypothesis, then religious faith is a pure superfluity, better pruned away, and controversy about its legitimacy is a piece of idle trifling, unworthy of serious minds. I myself believe, of course, that the religious hypothesis gives to the world an expression which specifically determines our reactions, and makes them in a large part unlike what they might be on a purely naturalistic scheme of belief.

William James
The Will To Believe.
1897

* * * *

The Will To Believe.[2]

In the recently published Life by Leslie Stephen of I his brother, Fitz-James, there is an account of a school to which the latter went when he was a boy. The teacher, a certain Mr. Guest, used to converse with his pupils in this wise: "Gurney, what is the difference between justification and sanctification? Stephen, prove the omnipotence of God!" etc. In the midst of our Harvard freethinking and indifference we are prone to imagine that here at your good old orthodox College conversation continues to be somewhat upon this order; and to show you that we at Harvard have not lost all interest in these vital subjects, I have brought with me to-night something like a sermon on justification by faith to read to you, -- I mean an essay in justification of faith, a defense of our right to adopt a believing attitude in religious matters, in spite of the fact that our merely logical intellect may not have been coerced. I The Will to Believe,' accordingly, is the title of my paper.

I have long defended to my own students the lawfulness of voluntarily adopted faith; but as soon as they have got well imbued with the logical spirit, they have as a rule refused to admit my contention I to be lawful philosophically, even though in point of fact they were personally all the time chock-full of some faith or other themselves. I am all the while, however, so profoundly convinced that my own position is correct, that your invitation has seemed to me a good occasion to make my statements more clear. Perhaps your minds will be more open than those with which I have hitherto had to deal, I will be as little technical as I can, though I must begin by setting up some technical distinctions that will help us in the end.

1. Hypotheses and Options. Let us give the name of <hypothesis> to anything that may be proposed to our belief; and just as the electricians speak of live and dead wires, let us speak of any hypothesis as either <live> or <dead>. A live hypothesis is one which appeals as a real possibility to him to whom it is proposed. If I asked you to believe in the Mahdi, the notion makes no electric connection with your nature, -- it refuses to scintillate with any credibility at all. As an hypothesis it is completely dead. To an Arab, however (even if he be not one of the Mahdi's followers), the hypothesis is among the mind's possibilities: it is alive. This shows that deadness and liveness in an hypothesis are not intrinsic properties, but relations to the individual thinker. They are measured by his willingness to act. The maximum of liveness in an

hypothesis , means willingness to act irrevocably. Practically, that means belief; but there is some believing tendency wherever there is willingness to act at all.

Next, let us call the decision between two hypotheses an <option>. Options may be of several kinds. They may be -- 1. <living> or <dead>; 2. <forced> or <avoidable>; 3, <momentous> or <trivial>; and for our purposes we may call an option a genuine option when it is of the forced, living, and momentous kind.

1. A living option is one in which both hypotheses are live ones. If I say to you: "Be a theosophist or be a Mohammedan," it is probably a dead option, because for you neither hypothesis is likely to be alive. But if I say: " Be an agnostic or be a Christian," it is otherwise: trained as you are, each hypothesis makes some appeal, however small, to your belief.

2. Next, if I say to you: "Choose between going out with your umbrella or without it," I do not offer you a genuine option, for it is not forced. You can easily avoid it by not going out at all. Similarly, if I say, "Either love me or hate me," "Either call my theory true or call it false," your option is avoidable. You may remain indifferent to me, neither loving nor hating, and you may decline to offer any judgment as to my theory. But if I say, "Either accept this truth or go without it," I put on you a forced option, for there is no standing place outside of the alternative. Every dilemma based on a complete logical disjunction, with no possibility of not choosing, is an option of this forced kind.

3. Finally, if I were Dr. Nansen and proposed to you to join my North Pole expedition, your option would be momentous; for this would probably be your only similar opportunity, and your choice now would either exclude you from the North Pole sort of immortality altogether or put at least the chance of it into your hands. He who refuses to embrace a unique opportunity loses the prize as surely as if he tried and failed. <Per contra>, the option is trivial when the opportunity is not unique, when the stake is insignificant, or when the decision is reversible if it later prove unwise. Such trivial options abound in the scientific life. A chemist finds an hypothesis live enough to spend a year in its verification: he believes in it to that extent. But if his experiments prove inconclusive either way, he is quit for his loss of time, no vital harm being done.

It will facilitate our discussion if we keep all these distinctions well in mind.

2. Pascal's Wager. The next matter to consider is the actual psychology of human opinion. When we look at certain facts, it seems as if our passional and volitional nature lay at the root of all our convictions. When we look at others, it seems as if they could do nothing when the intellect had once said its say. Let us take the latter facts up first

Does it not seem preposterous on the very face of it to talk of our opinions being modifiable at will? Can our will either help or hinder our 'intellect in its perceptions of truth? Can we, by just willing it, believe that Abraham Lincoln's existence is a myth, and that the portraits of him in McClure's Magazine are all of some one else? Can we, by any effort of our will, or by any strength of wish that it were true, believe ourselves well and about when we are roaring with rheumatism in bed, or feel certain that the sum of the two one-dollar bills in our pocket must be a hundred dollars? We can <say> any of these things, but we are absolutely impotent to believe them; and of just such things is the whole fabric of the truths that we do believe in made up, -- matters of fact, immediate or remote, as Hume said, and relations between ideas, which are either there or not there for us if we see them so, and which if not there cannot be put there by any action of our own.

In Pascal's Thoughts there is a celebrated passage known in literature as Pascal's wager. In it he tries to force us into Christianity by reasoning as if our concern with truth resembled our concern with the stakes in a game of chance. Translated freely his words are these: You must either believe or not believe that God is -- which will you do? Your human reason cannot say. A game is going on between you and the nature of 'things which at the day of judgment will bring out either heads or tails. Weigh what your gains and your losses would be if you should stake all you have on heads, or God's existence: if you win in such case, you gain eternal beatitude; if you lose, you lose nothing at all. If there were an infinity of chances, and only one for God in this wager, still you ought to stake your all. on God; for though you surely risk a finite loss by this procedure, any finite loss is reasonable, even a certain one is reasonable, if there is but the possibility of infinite gain. Go, then, and take holy water, and have masses said; belief will come and stupefy your scruples, -- <Cela vous fera croire et vous abltira>. Why should you not? At bottom, what have you to lose?

You probably feel that when religious faith expresses itself thus, in the language of the gamingtable, it is put to its last trumps. Surely Pascal's own personal belief in masses and holy water had far other springs; and this celebrated page of his is but an argument for others, a last desperate snatch at a weapon against the hardness of the unbelieving heart. We feel that a faith in masses and holy water adopted willfully after such a mechanical calculation -- would lack the inner soul of faith's reality; and if we were ourselves in the place of the Deity, we should probably take particular pleasure in cutting off believers of this pattern from their infinite reward. It is evident that unless there be some pre-existing tendency to believe in masses and holy water, the option offered to 'the will by Pascal is not a living option. Certainly no Turk ever took to masses and holy water on its account; and even to us Protestants these means of salvation seem such foregone impossibilities that Pascal's logic, invoked for them specifically, leaves us unmoved. As well might the Mahdi write to us, saying, "I am the Expected One whom God has created in his effulgence. You shall be infinitely happy if

you confess me; otherwise you shall be cut off from the light of the sun. Weigh, then, your infinite gain if I am genuine against your finite sacrifice if I am not! " His logic would be that of Pascal; but he would vainly use it on us, for the hypothesis he offers us is dead. No tendency to act on it exists in us to any degree.

The talk of believing by our volition seems, then, from one point of view, simply silly. From another point of view it is worse than silly, it is vile. When one turns to the magnificent edifice of the physical sciences, and sees how it was reared; what thousands of disinterested moral lives of men lie buried in its mere foundations; what patience and postponement, what choking down of preference, what submission to the icy laws of outer fact are wrought into its very stones and mortar; how absolutely impersonal it stands in its vast augustness, -- then how besotted and contemptible seems every little sentimentalist who comes blowing his voluntary smoke-wreaths, and pretending to decide things from out of his private dream! Can we wonder if those bred in the rugged and manly school of science should feel like spewing such subjectivism out of their mouths? The whole system of loyalties which grow up in the schools of science go dead against its toleration; so that it is only natural that those who have caught the scientific fever should pass over to the opposite extreme, and write sometimes as if the incorruptibly truthful intellect ought positively to prefer bitterness and unacceptableness to the heart in its cup.

It fortifies my soul to know
That, though I perish, Truth is so --

sings Clough, while Huxley exclaims: "My only consolation lies in the reflection that, however bad our posterity may become, so far as they hold by the plain rule of not pretending to believe what they have no reason to believe, because it may be to their advantage so to pretend [the word ' pretend' is surely here redundant], they will not have reached the lowest depth of immorality." And that delicious <enfant terrible> Clifford writes: " Belief is desecrated when given to unproved and unquestioned statements for the solace and private pleasure of the believer. . . . Whoso would deserve well of his fellows in this matter will guard the purity of his belief with a very fanaticism of jealous care, lest at any time it should rest on an unworthy object, and catch a stain which can never be wiped away. . . . If [a] belief has been accepted on insufficient evidence [even though the belief be true, as Clifford on the same page explains] the pleasure is a stolen one. . . . It is sinful because it is stolen in defiance of our duty to mankind. That duty is to guard ourselves from such beliefs as from a pestilence which may shortly master our own body and then spread to the rest of the town. . . . It is ,wrong always, everywhere, and for every one, to believe anything upon insufficient evidence."

3. Clifford's Veto, Psychological Causes of Belief. All this strikes one as healthy, even when expressed, as by Clifford, with somewhat too much of robustious pathos in the voice.,; Free-will and simple wishing do seem, in the matter

of our credences, to be only fifth wheels to the coach. Yet if any one should thereupon assume that intellectual insight is what remains after wish and will and sentimental preference have taken wing, or that pure reason is what then settles our opinions, he would fly quite as directly in the teeth of the facts.

It is only our already dead hypotheses that our willing nature is unable to bring to life again But what has made them dead for us is for the most part a previous action of our willing nature of an antagonistic kind. When I say 'willing nature,' I do not mean only such deliberate volitions as may have set up habits of belief that we cannot now escape from, I mean all such factors of belief as fear and hope, prejudice and passion, imitation and partisanship, the circumpressure of our caste and set. As a matter of fact we find ourselves believing, we hardly know how or why. Mr. Balfour gives the name of authority' to all those influences, born of the intellectual climate, that make hypotheses possible or impossible for us, alive or dead. Here in this room, we all of us believe in molecules and the conservation of energy, in democracy and necessary progress, in Protestant Christianity and the duty of fighting for 'the doctrine of the immortal Monroe,' all for no reasons worthy of the name. We see into these matters with no more inner clearness,. and probably with much less, than any disbeliever in them might possess. His unconventionality would probably have some grounds to show for its conclusions; but for us, not insight, but the <prestige> of the opinions, is what makes the spark shoot from them and light up our sleeping magazines of faith. Our reason is quite satisfied, in nine hundred and ninety-nine cases out of every thousand of us, if it can find a few arguments that will do to recite in case our credulity is criticized by some one else. Our faith is faith in some one else's faith, and in the greatest matters this is most the case. Our belief in truth itself, for instance, that there is a truth, and that our minds and it are made for each other, -- what is it but a passionate affirmation of desire, in which our social system backs us up? We want to have a truth; we want to believe that our experiments and studies and discussions must put us in a continually better and better position towards it; and on this line we agree to fight out our thinking lives. But if a pyrrhonistic skeptic asks us <how we know> all this, can our logic find a reply? No! certainly it cannot. It is just one volition against another, -- we willing to go in for life upon a trust or assumption which he, for his part, does not care to make.[3] As a rule we disbelieve all facts and theories for which we have no use. Clifford's cosmic emotions find no use for Christian feelings. Huxley belabors the bishops because there is no use for sacerdotalism in his scheme of life. Newman, on the contrary, goes over to Romanism, and finds all sorts of reasons good for staying there, because a priestly system is for him an organic need and delight. Why do so few "scientists" even look at the evidence for telepathy, so-called? Because they think, as a leading biologist, now dead, once said to me, that even if such a thing were true, scientists ought to band together to keep it suppressed and concealed. It would undo the uniformity of Nature and all sorts of other things without which scientists cannot carry

on their pursuits. But if this very man had been shown something which as a scientist he might <do> with telepathy, he might not only have examined the evidence, but even have found it good enough. This very law which the logicians would impose upon us -- if I may give the name of logicians to those who would rule out our willing nature here -- is based on nothing but their own natural wish to exclude all elements form which they, in their professional quality of logicians, can find no use.

Evidently, then, our non-intellectual nature does influence our convictions. There are passional tendencies and volitions which run before and others which come after belief, and it is only the latter that are too late for the fair; and they are not too late when the previous passional work has been already in their own direction. Pascal's argument, instead of being powerless, then seems a regular clincher, and is the last stroke needed to make our faith in masses and holy water complete. The state of things is evidently far from simple; and pure insight and logic, whatever they might do ideally, are not the only things that really do produce our creeds.

4. Thesis of the Essay. Our next duty, having recognized this mixed-up state of affairs, is to ask whether it be simply reprehensible and pathological, or whether, on the contrary, we must treat it as a normal element in making up our minds. The thesis I defend is, briefly stated, this: <Our passional nature not only lawfully may, but must, decide an o option between propositions, whenever it is a genuine option that cannot by its nature be decided on intellectual grounds ; for to say, under such circumstances, " Do not decide, but leave the question open," is itself a passional decision, -- just like deciding yes or no, -- and is attended with the same risk of losing the truth.> The thesis thus abstractly expressed will, I trust, soon become quite clear. But I must first indulge in a bit more of preliminary work.

5. Empiricism and Absolutism. It will be observed that for the purposes of this discussion we are on 'dogmatic ' ground, -- ground, I mean, which leaves systematic philosophical skepticism altogether out of account. The postulate that there is truth, and that it is the destiny of our minds to attain it, we are deliberately resolving to make, though the skeptic will not make it. We part company with him, therefore, absolutely, at this point. But the faith that truth exists, and that our minds can find it, may be held in two ways. We may talk of the <empiricist> way and of the <absolutist> way of believing in truth. The absolutists in this matter say that we not only can attain to knowing truth, but we can <know> when we have attained to knowing it; while the empiricists think that although we may attain it, we cannot infallibly know when. To <know> is one thing, and to know for certain <that> we know is another. One may hold to the first being possible without the second; hence the empiricists and the absolutists, although neither of them is a skeptic in the usual philosophic sense of the term, show very different degrees of dogmatism in their lives.

If we look at the history of opinions, we see that the empiricist tendency has largely prevailed in science, while in philosophy the absolutist tendency has had everything its own way. The characteristic sort of happiness, indeed, which philosophies yield has mainly consisted in the conviction felt by each successive school or system that by it bottom-certitude had been attained. "Other philosophies are collections of opinions, mostly false; <my> philosophy gives standing-ground forever," -- who does not recognize in this the key-note of every system worthy of the name? A system, to be a system at all, must come as a <closed> system, reversible in this or that detail, perchance, but in its essential features never!

Scholastic orthodoxy, to which one must always go when one wishes to find perfectly clear statement, has beautifully elaborated this absolutist conviction in a doctrine which it calls that of ' objective evidence.' If, for example, I am unable to doubt that I now exist before you, that two is less than three, or that if all men are mortal then I am mortal too, it is because these things illumine my intellect irresistibly. The final ground of this objective evidence possessed by certain propositions is the <adaequatio intellectus nostri cum re>. The certitude it brings involves an <apititudinem ad extorquendum certum assensum> on the part of the truth envisaged, and on the side of the subject a <quietem in cognitione>, when once the object is mentally received, that leaves no possibility of doubt behind; and in the whole transaction nothing operates but the <entitas ipsa> of the object and the <entitas ipsa> of the mind. We slouchy modern thinkers dislike to talk in Latin, -- indeed, we dislike to talk in set terms at all; but at bottom our own state of mind is very much like this whenever we uncritically abandon ourselves: You believe in objective evidence, and I do. Of some things we feel that we are certain: we know, and we know that we do know. There is something that gives a click inside of us, a bell that strikes twelve, when the hands of our mental clock have swept the dial and meet over the meridian hour. The greatest empiricists among us are only empiricists on reflection: when left to their instincts, they dogmatize like infallible popes. When the Cliffords tell us how sinful it is to be Christians on such 'insufficient evidence,' insufficiency is really the last thing they have in mind. For them the evidence is absolutely sufficient, only it makes the other way. They believe so completely in an anti-Christian order of the universe that there is no living option: Christianity is a dead hypothesis from the start.

6. Objective Certitude and its Unattainability. But now, since we are all such absolutists by instinct, what in our quality of students of philosophy ought we to do about the fact? Shall we espouse and endorse it? Or shall we treat it as a weakness of our nature from which we must free ourselves, if we can?

I sincerely believe that the latter course is the only one we can follow as reflective men. Objective evidence and certitude are doubtless very fine ideals to play with, but where on this moonlit and dream-visited planet are they

found? I am, therefore, myself a complete empiricist so far as my theory of human knowledge goes. I live, to be sure, by the practical faith that we must go on experiencing and thinking over our experience, for only thus can our opinions grow more true; but to hold any one of them -- I absolutely do not care which -- as if it never could be reinterpretable or corrigible, I believe to be a tremendously mistaken attitude, and I think that the whole history of philosophy will bear me out. There is but one indefectibly certain truth, and that is the truth that pyrrhonistic skepticism itself leaves standing, -- the truth that the present phenomenon of consciousness exists. That, however, is the bare starting-point of knowledge, the mere admission of a stuff to be philosophized about. The various philosophies are but so many attempts at expressing what this stuff really is. And if we repair to our libraries what disagreement do we discover! Where is a certainly true answer found? Apart from abstract propositions of comparison (such as two and two are the same as four), propositions which tell us nothing by themselves about concrete reality, we find no proposition ever regarded by any one as evidently certain that has not either been called a falsehood, or at least had its truth sincerely questioned by some one else. The transcending of the axioms of geometry, not in play but in earnest, by certain of our contemporaries (as Zollner and Charles H. Hinton), and the rejection of the whole Aristotelian logic by the Hegelians, are striking instances in point.

No concrete test of what is really true has ever been agreed upon. Some make the criterion external to the moment of perception, putting it either in revelation, the <consensus gentium>, the instincts of the heart, or the systematized experience of the race. Others make the perceptive moment its own test, Descartes, for instance, with his clear and distinct ideas guaranteed by the veracity of God; Reid with his 'common-sense;' and Kant with his forms of synthetic judgment <a priori>. The inconceivability of the opposite; the capacity to be verified by sense; the possession of complete organic unity or self-relation, realized when a thing is its own other, -- are standards which, in turn, have been used, The much lauded objective evidence is never triumphantly there; it is a mere aspiration or <Grenzbegriff>, marking the infinitely remote ideal of our thinking life. To claim that certain truths now possess it, is simply to say that when you think them true and they <are> true, then their evidence is objective, otherwise it is not. But practically one's conviction that the evidence one goes by is of the real objective brand, is only one more subjective opinion added to the lot. For what a contradictory array of opinions have objective evidence and absolute certitude been claimed! The world is rational through and through, -- its existence is an ultimate brute fact; there is a personal God, -- a personal God is inconceivable; there is an extra-mental physical world immediately known, -- the mind can only know its own ideas; a moral imperative exists, -- obligation is only the resultant of desires; a permanent spiritual principle is in every one, -- there are only shifting states of mind; there is an endless chain of causes, -- there is an absolute first cause; an eternal necessity, -- a freedom; a purpose, -- no

purpose; a primal One, -- a primal Many; a universal continuity, -- an essential discontinuity in things; an infinity, -- no infinity. There is this, -- there is that; there is indeed nothing which some one has not thought absolutely true, while his neighbor deemed it absolutely false; and not an absolutist among them seems ever to have considered that the trouble may all the time be essential, and that the intellect, even with truth directly in its grasp, may have no infallible signal for knowing whether it be truth or no. When, indeed, one remembers that the most striking practical application to life of the doctrine of objective certitude has been the conscientious labors of the Holy Office of the Inquisition, one feels less tempted than ever to lend the doctrine a respectful ear.

But please observe, now, that when as empiricists we give up the doctrine of objective certitude, we do not thereby give up the quest or hope of truth itself. We still pin our faith on its existence, and still believe that we gain an ever better position towards it by systematically continuing to roll up experiences and think. Our great difference from the scholastic lies in the way we face. The strength of his system lies in the principles, the origin, the <terminus a quo> of his thought; for us the strength is in the outcome, the upshot, the <terminus ad quem>. Not where it comes from but what it leads to is to decide. It, matters not to an empiricist from what quarter an hypothesis may come to him: he may have acquired it by fair means or by foul; passion may have whispered or accident suggested it; but if the total drift of thinking continues to confirm it, that is what he means b its being true.

7. Two Different Sorts of Risks in Believing. One more point, small but important, and our preliminaries are done. There are two ways of looking at our duty in the. matter of opinion, -- ways entirely different, and yet ways about whose difference the theory of knowledge seems hitherto to have shown very little concern. <We must know the truth>; and <we must avoid error>, -- these are our first and great commandments as would-be knowers; but they are not two ways of stating an identical commandment, they are two separable laws. Although it may indeed happen that when we believe the truth A, we escape as an incidental consequence from believing the falsehood B, it hardly ever happens that by merely disbelieving B we necessarily believe A. We may in escaping B fall into believing other falsehoods, C or D, just as bad as B; or we may escape B by not believing anything at all not even A. Believe truth! Shun error -- these, we see, are two materially different laws; and by choosing between them we may end by coloring differently our whole intellectual life. We may regard the chase for truth as paramount, and the avoidance of error as secondary; or we may, on the other hand, treat the avoidance of error as more imperative, and let truth take its chance. Clifford, in the instructive passage which I have quoted, exhorts us to the latter course. Believe nothing, he tells us, keep your mind in suspense forever', rather than by closing it on insufficient evidence incur the awful risk of believing lies. You, on the other hand, may think that the risk Of being in error is a very small matter when compared with the blessings of real knowledge, and be ready to be duped many

times in your investigation rather than postpone indefinitely the chance of guessing true. I myself find it impossible to go with Clifford. We must remember that these feelings of our duty about either truth or error are in any case only expressions of our passional life. Biologically considered, our minds are as ready to grind out falsehood as veracity, and he who says, "Better go without belief forever than believe a lie!" merely shows his own preponderant private horror of becoming a dupe. He may be critical of many of his desires and fears, but this fear he slavishly obeys. He cannot imagine any one questioning its binding force. For my own part, I have also a horror of being duped; but I can believe that worse things than being duped may happen to a man in this world: so Clifford's exhortation has to my ears a thoroughly fantastic sound. It is like a general informing his soldiers that it is better to keep out of battle forever than to risk a single wound. Not so are victories either over enemies or over nature gained. Our errors are surely not such awfully solemn things. In a world where we are so certain to incur them in spite of all our caution, a certain lightness of heart seems healthier than this excessive nervousness on their behalf At any rate, it seems the fittest thing for the empiricist philosopher.

8. Some Risk Unavoidable. And now, after all this introduction, let us go straight at our question. I have said, and now repeat it, that not only as a matter of fact do we find our passional nature influencing us in our opinions, but that there are some options between opinions in which this influence must be regarded both as an inevitable and as a lawful determinant of our choice.

I fear here that some of you my hearers will begin to scent danger, and lend an inhospitable ear. Two first steps of passion you have indeed had to admit as necessary, -- we must think so as to avoid dupery, and -- we must think so as to gain truth; but the surest path to those ideal consummations, you will probably consider, is from now onwards to take no further passional step.

Well, of course, I agree as far as the facts will allow. Wherever the option between losing truth and gaining it is not momentous, we can throw the chance of <gaining truth> away, and at any rate save ourselves from any chance of <believing falsehood>, by not making up our minds at all till objective evidence has come. In scientific questions, this is almost always the case; and even in human affairs in general, the need of acting is seldom so urgent that a false belief to act on is better than no belief at all. Law courts, indeed, have to decide on the best evidence attainable for the moment, because a judge's duty is to make law as well as to ascertain it, and (as a learned judge once said to me) few cases are worth spending much time over: the great thing is to have them decided on any acceptable principle, and got out of the way. But in our dealings with objective nature we obviously are recorders, not makers, of the truth; and decisions for the mere sake of deciding promptly and getting on to the next business would be wholly out of place. Throughout the breadth of physical nature facts are what they are quite independently of us, and seldom is there any such hurry about them that the risks of

being duped by believing a premature theory need be faced. The questions here are always trivial options, the hypotheses are hardly living (at any rate not living for us spectators), the choice between believing truth or falsehood is seldom forced. The attitude of skeptical balance is therefore the absolutely wise one if we would escape mistakes. What difference, indeed, does it make to most of us whether we have or have not a theory of the Rontgen rays, whether we believe or not in mind-stuff, or have a conviction about the causality of conscious states? It makes no difference. Such options are not forced on us. On every account it is better not to make them, but still keep weighing reasons Pro <et contra> with an indifferent hand.

I speak, of course, here of the purely judging mind. For purposes of discovery such indifference is to be less highly recommended, and science would be far less advanced than she is if the passionate desires of individuals to get their own faiths confirmed had been kept out of the game. See for example the sagacity which Spencer and Weismann now display. On the other hand, if you want an absolute duffer in an investigation, you must, after all, take the man who has no interest whatever in its results: he is the warranted incapable, the positive fool. The most useful investigator, because the most sensitive observer, is always he whose eager interest in one side of the question is balanced by an equally keen nervousness lest he become deceived.[4] Science has organized this nervousness into a regular <technique>, her so-called method of verification; and she has fallen so deeply in love with the method that one may even say she has ceased to care for truth by itself at all. It is only truth as technically verified that interests her. The truth of truths might come in merely affirmative form, and she would decline to touch it. Such truth as that, she might repeat with Clifford, would be stolen in defiance of her duty to mankind. Human passions, however, are stronger than technical rules. " Le coeur a ses raisons," as Pascal says, " que la raison ne connait pas;" and however indifferent to all but the bare rules of the game the umpire, the abstract intellect, may be, the concrete players who furnish him the materials to judge of are usually, each one of them, in love with some pet 'live hypothesis' of his own. Let us agree, however, that wherever there is no forced option, the dispassionately judicial intellect with no pet hypothesis, saving us, as it does, from dupery at any rate, ought to be our ideal.

The question next arises: Are there not somewhere forced options in our speculative questions, and can we (as men who may be interested at least as much in positively gaining truth as in merely escaping dupery) always wait with impunity till the coercive evidence shall have arrived? It seems <a priori> improbable that the truth should be so nicely adjusted to our needs and powers as that. In the great boarding-house of nature, the cakes and the butter and the syrup seldom come out so even and leave the plates so clean. Indeed, we should view them with scientific suspicion if they did.

9. Faith May Bring Forth its Own Verification. <Moral questions> immediately present themselves as questions whose

solution cannot wait for sensible proof. A moral question is a question not of what sensibly exists, but of what is good, or would be good if it did exist. Science can tell us what exists; but to compare the <worths>, both of what exists and of what does not exist, we must consult not science, but what Pascal calls our heart. Science herself consults her heart when she lays it down that the infinite ascertainment of fact and correction of false belief are the supreme goods for man. Challenge the statement, and science can only repeat it oracularly, or else prove it by showing that such ascertainment and correction bring man all sorts of other goods which man's heart in turn declares. The question of having moral beliefs at all or not having them is decided by our will. Are our moral preferences true or false, or are they only odd biological phenomena, making things good or bad for <us>, but in themselves indifferent? How can your pure intellect decide? If your heart does not <want> a world of moral reality, your head will assuredly never make you believe in one. Mephistophelian skepticism, indeed, will satisfy the head's play-instincts much better than any rigorous idealism can. Some men (even at the student age) are so naturally cool-hearted that the moralistic hypothesis never has for them any pungent life, and in their supercilious presence the hot young moralist always feels strangely ill at ease. The appearance of knowingness is on their side, of <naivet,> and gullibility on his. Yet, in the inarticulate heart of him, he clings to it that he is not a dupe, and that there is a realm in which (as Emerson says) all their wit and intellectual superiority is no better than the cunning of a fox. Moral skepticism can no more be refuted or proved by logic than intellectual skepticism can. When we stick to it that there <is> truth (be it of either kind), we do so with our whole nature, and resolve to stand or fall by the results. The skeptic with his whole nature adopts the doubting attitude; but which of us is the wiser, Omniscience only knows.

Turn now from these wide questions of good to a certain class of questions of fact, questions concerning personal relations, states of mind between one man and another. <Do you like me or not?> -- for example. Whether you do or not depends, in countless instances, on whether I meet you half-way, am willing to assume that you must like me, and show you trust and expectation. The previous faith on my part in your liking's existence is in such cases what makes your liking come. But if I stand aloof, and refuse to budge an inch until I have objective evidence, until you shall have done something apt, as the absolutists say, <ad extorquendum assensum meum>, ten to one your liking never comes. How many women's hearts are vanquished by the mere sanguine insistence of some man that they <must> love him! he will not consent to the hypothesis that they cannot. The desire for a certain kind of truth here brings about that special truth's existence; and so it is in innumerable cases of other sorts. Who gains promotions, boons, appointments, but the man in whose life they are seen to play the part of live hypotheses, who discounts them, sacrifices other things for their sake before they have come, and takes risks for them in advance? His faith acts on the powers above him as a claim, and creates its own verification.

A social organism of any sort whatever, large or small, is what it is because each member proceeds to his own duty with a trust that the other members will simultaneously do theirs. Wherever a desired result is achieved by the co-operation of many independent persons, its existence as a fact is a pure consequence of the precursive faith in one another of those immediately concerned. A government, an army, a commercial system, a ship, a college, an athletic team, all exist on this condition, without which not only is nothing achieved, but nothing is even attempted. A whole train of passengers (individually brave enough) will be looted by a few highwaymen, simply because the latter can count on one another, while each passenger fears that if he makes a movement of resistance, he will be shot before any one else backs him up. If we believed that the whole car-full would rise at once with us, we should each severally rise, and train-robbing would never even be attempted. There are, then, cases where a fact cannot come at all unless a preliminary faith exists in its coming. <And where faith in a fact can help create the fact>, that would be an insane logic which should say that faith running ahead of scientific evidence is the 'lowest kind of immorality' into which a thinking being can fall. Yet such is the logic by which our scientific absolutists pretend to regulate our lives!

10. Logical Conditions of Religious Belief. In truths dependent on our personal action, then, faith based on desire is certainly a lawful and possibly an indispensable thing.

But now, it will be said, these are all childish human cases, and have nothing to do with great cosmical matters, like the question of religious faith. Let us then pass on to that. Religions differ so much in their accidents that in discussing the religious question we must make it very generic and broad. What then do we now mean by the religious hypothesis? Science says things are; morality says some things are better than other things; and religion says essentially two things.

First, she says that the best things are the more eternal things, the overlapping things, the things in the universe that throw the last stone, so to speak, and say the final word. " Perfection is eternal," this phrase of Charles Secretan seems a good way of putting this first affirmation of religion, an affirmation which obviously cannot yet be verified scientifically at all.

The second affirmation of religion is that we are better off even now if we believe her first affirmation to be true.

Now, let us consider what the logical elements of this situation are <in case the religious hypothesis in both its branches be really true>. (Of course, we must admit that possibility at the outset. If we are to discuss the question at all, it must involve a living option. If for any of you religion be a hypothesis that cannot, by any living possibility be true, then you need go no farther. I speak to the 'saving remnant' alone.) So proceeding, we see, first,

that religion offers itself as a <momentous> option. We are supposed to gain, even now, by our belief, and to lose by our nonbelief, a certain vital good. Secondly, religion is a <forced> option, so far as that good goes. We cannot escape the issue by remaining skeptical and waiting for more light, because, although we do avoid error in that way <if religion be untrue>, we lose the good, <if it be true>, just as certainly as if we positively chose to disbelieve. It is as if a man should hesitate indefinitely to ask a certain woman to marry him because he was not perfectly sure that she would prove an angel after he brought her home. Would he not cut himself off from that particular angel-possibility as decisively as if he went and married some one else? Skepticism, then, is not avoidance of option; it is option of a certain particular kind of risk. <Better risk loss of truth than chance of error>, -- that is' your faith-vetoer's exact position. He is actively playing his stake as much as the believer is; he is backing the field against the religious hypothesis, just as the believer is backing the religious hypothesis against the field. To preach skepticism to us as a duty until 'sufficient evidence' for religion be found, is tantamount therefore to telling us, when in presence of the religious hypothesis, that to yield to our fear of its being error is wiser and better than to yield to our hope that it may be true. It is not intellect against all passions, then; it is only intellect with one passion laying down its law. And by what, forsooth, is the supreme wisdom of this passion warranted? Dupery for dupery, what proof is there that dupery through hope is so much worse than dupery through fear? I, for one, can see no proof; and I simply refuse obedience to the scientist's command to imitate his kind of option, in a case where my own stake is important enough to give me the right to choose my own form of risk. If religion be true and the evidence for it be still insufficient, I do not wish, by putting your extinguisher upon my nature (which feels to me as if it had after all some business in this matter), to forfeit my sole chance in life of getting upon the winning side, -- that chance depending, of course, on my willingness to run the risk of acting as if my passional need of taking the world religiously might be prophetic and right.

All this is on the supposition that it really may be prophetic and right, and that, even to us who are discussing the matter, religion is a live hypothesis which may be true. Now, to most of us religion comes in a still further way that makes a veto on our active faith even more illogical. The more perfect and more eternal aspect of the universe is represented in our religions as having personal form. The universe is no longer a mere <It> to us, but a <Thou>, if we are religious; and any relation that may be possible from person to person might be possible here. For instance, although in one sense we are passive portions of the universe, in another we show a curious autonomy, as if we were small active centers on our own account. We feel, too, as if the appeal of religion to us were made to our own active good-will, as if evidence might be forever withheld from us unless we met the hypothesis half-way. To take a trivial illustration: just as a man who in a company of gentlemen made no advances, asked a warrant for every concession, and believed no one's word without proof, would

cut himself off by such churlishness from all the social rewards that a more trusting spirit would earn, -- so here, one who should shut himself up in snarling logicality and try to make the gods extort his recognition willy-nilly, or not get it at all, might cut himself off forever from his only opportunity of making the gods' acquaintance. This feeling, forced on us we know not whence, that by obstinately believing that there are gods (although not to do so would be so easy both for our logic and our life) we are doing the universe the deepest service we can, seems part of the living essence of the religious hypothesis. If the hypothesis <were> true in all its parts, including this one, then pure intellectualism, with its veto on our making willing advances, would be an absurdity; and some participation of our sympathetic nature would be logically required. I, therefore, for one, cannot see my way to accepting the agnostic rules for truth-seeking, or willfully agree to keep my willing nature out of the game. I cannot do so for this plain reason, that <a rule of thinking which would absolutely prevent me from acknowledging certain kinds of truth if those kinds of truth were really there, would be an irrational rule>. That for me is the long and short of the formal logic of the situation, no matter what the kinds of truth might materially be.

I confess I do not see how this logic can be escaped. But sad experience makes me fear that some of you may still shrink from radically saying with me, <in abstractor> that we have the right to believe at our own risk any hypothesis that is live enough to tempt our will. I suspect, however, that if this is so, it is because you have got away from the abstract logical point of view altogether, and are thinking (perhaps without realizing it) of some particular religious hypothesis which for you is dead. The freedom to 'believe what we will' you apply to the case of some patent superstition; and the faith you think of is the faith defined by the schoolboy when he said, " Faith is when you believe something that you know ain't true." I can only repeat that this is misapprehension. <In concreto>, the freedom to believe can only cover living options which the intellect of the individual cannot by itself resolve; and living options never seem absurdities to him who has them to consider. When I look at the religious question as it really puts itself to concrete men, and when I think of all the possibilities which both practically and theoretically it involves, then this command that we shall put a stopper on our heart, instincts, and courage, and <wait> -- acting of course meanwhile more or less as if religion were <not> true[5] -- till doomsday, or till such time as our intellect and senses working together may have raked in evidence enough, -- this command, I say, seems to me the queerest idol ever manufactured in the philosophic cave. Were we scholastic absolutists, there might be more excuse. If we had an infallible intellect with its objective certitudes, we might feel ourselves disloyal to such a perfect organ of knowledge in not trusting to it exclusively, in not waiting for its releasing word. But if we are empiricists, if we believe that no bell in us tolls to let us know for certain when truth is in our grasp, then it seems a piece of idle fantasticality to preach so solemnly our duty of waiting for the bell. Indeed we <may>

wait if we will, -- I hope you do not think that I am denying that, -- but if we do so, we do so at our peril as much as if we believed. In either case we <act>, taking our life in our hands. No one of us ought to issue vetoes to the other, nor should we bandy words of abuse. We ought, on the contrary, delicately and profoundly to respect one another's mental freedom: then only shall we bring about the intellectual republic; then only shall we have that spirit of inner tolerance without which all our outer tolerance is soulless, and which is empiricism's glory; then only shall we live and let live, in speculative as well as in practical things.

I began by a reference to Fitz James Stephen; let me end by a quotation from him. " What do you think of yourself? What do you think of the world? . . . These are questions with which all must deal as it seems good to them. They are riddles of the Sphinx, in some way or other we must deal with them... In all important transactions of life we have to a leap in the dark. . . . If we decide to leave the riddles unanswered, that is a choice; if we waver in our answer, that, too, is a choice: but whatever choice we make, we make it at our peril. If a man chooses to turn his back altogether on God and the future, no one can prevent him; no one can show beyond reasonable doubt that he is mistaken. If a man thinks otherwise and acts as he thinks, I do not see that any one can prove that <he> is mistaken. Each must act as he thinks best; and if he is wrong, so much the worse for him. We stand on a mountain pass in the midst of whirling snow and blinding mist, through which we get glimpses now and then of paths which may be deceptive. If we stand still we shall be frozen to death. If we take the wrong road we shall be dashed to pieces. We do not certainly know whether there is any right one. What must we do? "Be strong and of a good courage." Act for the best, hope for the best, and take what comes. . . . If death ends all, we cannot meet death better."[6]

EDITORIAL CONVENTIONS: letters between slashes (e.g., H/UME\) designate small capitalization. Letters within angled brackets (e.g., <Hume>) designate italics. Printer's errors have been corrected without note. Bracketed comments within the end notes are the editor's. This is a working draft. Please report errors to James Fieser (jfieser@utm.edu).]

2 An Address to the Philosophical Clubs of Yale and Brown Universities. Published in the New World, June, 1896.3 Compare the admirable page 310 in S. H. Hodpon's " Time and

Space," London, 1865.4 Compare Wilfrid Ward's Essay, "The Wish to Believe," in his Witnesses to the Unseen, Macmillan & Co., 1893.

5 Since belief is measured by action, he who forbids us to believe religion to be true, necessarily also forbids us to act as we should if we did believe it to be true. The whole defense of religious faith hinges upon action. If the action required or inspired by the religious hypothesis is in no way different from that dictated by the naturalistic hypothesis, then religious faith is a pure superfluity, better pruned away, and controversy about its legitimacy is a piece of idle trifling, unworthy of serious minds. I myself believe, of course, that the religious hypothesis gives to the world an expression which specifically determines our reactions, and makes them in a large part unlike what they might be on a purely naturalistic scheme of belief.

Prolegomena to Any Future Metaphysics
(1783)

Immanuel Kant

 The following is based on Paul Carus's 1902 translation of the Prolegomena. Spelling has been Americanized. A few of Lewis White Beck's conventions have been adopted from his revision of Carus's translation, such as replacing the word "cognise" with "knowledge."1

Contents:

* * * *

INTRODUCTION.

These Prolegomena are destined for the use, not of pupils, but of future teachers, and even the latter should not expect that they will be serviceable for the systematic exposition of a ready-made science, but merely for the discovery of the science itself.

There are scholarly men, to whom the history of philosophy (both ancient and modern) is philosophy itself; for these the present Prolegomena are not written. They must wait till those who endeavor to draw from the fountain of reason itself have completed their work; it will then be the historian's turn to inform the world of what has been done. Unfortunately, nothing can be said, which in their opinion has not been said before, and truly the same prophecy applies to all future time; for since the human reason has for many centuries speculated upon innumerable objects in various ways, it is hardly to be expected that we should not be able to discover analogies for every new idea among the old sayings of past ages.

My object is to persuade all those who think Metaphysics worth studying, that it is absolutely necessary to pause a moment, and, neglecting all that has been done, to propose first the preliminary question, 'Whether such a thing as metaphysics be at all possible?'

If it be a science, how comes it that it cannot, like other sciences, obtain universal and permanent recognition ? If not,

how can it maintain its pretensions, and keep the human mind in suspense with hopes, never ceasing, yet never fulfilled? Whether then we demonstrate our knowledge or our ignorance in this field, we must come once for all to a definite conclusion respecting the nature of this so-called science, which cannot possibly remain on its present footing. It seems almost ridiculous, while every other science is continually advancing, that in this, which pretends to be Wisdom incarnate, for whose oracle every one inquires, we should constantly move round the same spot, without gaining a single step. And so its followers having melted away, we do not find men confident of their ability to shine in other sciences venturing their reputation here, where everybody, however ignorant in other matters, may deliver a final verdict, as in this domain there is as yet no standard weight and measure to distinguish sound knowledge from shallow talk.

After all it is nothing extraordinary in the elaboration of a science, when men begin to wonder how far it has advanced, that the question should at last occur, whether and how such a science is possible? Human reason so delights in constructions, that it has several times built up a tower, and then razed it to examine the nature of the foundation. It is never too late to become wise; but if the change comes late, there is always more difficulty in starting a reform.

The question whether a science be possible, presupposes a doubt as to its actuality. But such a doubt offends the men whose whole possessions consist of this supposed jewel; hence he who raises the doubt must expect opposition from all sides. Some, in the proud consciousness of their possessions, which are ancient, and therefore considered legitimate, will take their metaphysical compendia in their hands, and look down on him with contempt; others, who never see anything except it be identical with what they have seen before, will not understand him, and everything will remain for a time, as if nothing had happened to excite the concern, or the hope, for an impending change.

Nevertheless, I venture to predict that the independent reader of these Prolegomena will not only doubt his previous science, but ultimately be fully persuaded, that it cannot exist unless the demands here stated on which its possibility depends, be satisfied; and, as this has never been done, that there is, as yet, no such thing as Metaphysics. But as it can never cease to be in demand,2 -- since the interests of common sense are intimately interwoven with it, he must confess that a radical reform, or rather a new birth of the science after an original plan, are unavoidable, however men may struggle against it for a while.

Since the Essays of Locke and Leibniz, or rather since the origin of metaphysics so far as we know its history, nothing has ever happened which was more decisive to its fate than the attack made upon it by David Hume. He threw no light on this species of knowledge, but he certainly struck a spark from which light might have been obtained, had it caught some inflammable substance and had its smoldering fire been carefully nursed and developed.

Hume started from a single but important concept in Metaphysics, viz., that of Cause and Effect (including its derivatives force and action, etc.). He challenges reason, which pretends to have given birth to this idea from herself, to answer

him by what right she thinks anything to be so constituted, that if that thing be posited, something else also must necessarily be posited; for this is the meaning of the concept of cause. He demonstrated irrefutably that it was perfectly impossible for reason to think a priori and by means of concepts a combination involving necessity. We cannot at all see why, in consequence of the existence of one thing, another must necessarily exist, or how the concept of such a combination can arise a priori. Hence he inferred, that reason was altogether deluded with reference to this concept, which she erroneously considered as one of her children, whereas in reality it was nothing but a bastard of imagination, impregnated by experience, which subsumed certain representations under the Law of Association, and mistook the subjective necessity of habit for an objective necessity arising from insight. Hence he inferred that reason had no power to think such, combinations, even generally, because her concepts would then be purely fictitious, and all her pretended a priori cognitions nothing but common experiences marked with a false stamp. In plain language there is not, and cannot be, any such thing as metaphysics at all.3

However hasty and mistaken Hume's conclusion may appear, it was at least founded upon investigation, and this investigation deserved the concentrated attention of the brighter spirits of his day as well as determined efforts on their part to discover, if possible, a happier solution of the problem in the sense proposed by him, all of which would have speedily resulted in a complete reform of the science.

But Hume suffered the usual misfortune of metaphysicians, of not being understood. It is positively painful to see bow utterly his opponents, Reid, Oswald, Beattie, and lastly Priestley, missed the point of the problem; for while they were ever taking for granted that which he doubted, and demonstrating with zeal and often with impudence that which he never thought of doubting, they so misconstrued his valuable suggestion that everything remained in its old condition, as if nothing had happened.

The question was not whether the concept of cause was right, useful, and even indispensable for our knowledge of nature, for this Hume had never doubted; but whether that concept could be thought by reason a priori, and consequently whether it possessed an inner truth, independent of all experience, implying a wider application than merely to the objects of experience. This was Hume's problem. It was a question concerning the origin, not concerning the indispensable need of the concept. Were the former decided, the conditions of the use and the sphere of its valid application would have been determined as a matter of course.

But to satisfy the conditions of the problem, the opponents of the great thinker should have penetrated very deeply into the nature of reason, so far as it is concerned with pure thinking,-a task which did not suit them. They found a more convenient method of being defiant without any insight, viz., the appeal to common sense. It is indeed a great gift of God, to possess right, or (as they now call it) plain common sense. But this common sense must be shown practically, by well-considered and reasonable thoughts and words, not by appealing to it as an oracle, when no rational justification can be advanced. To appeal to common sense, when insight and science fail, and no sooner-this is one of the subtle discoveries of modern times, by means of which the most

superficial ranter can safely enter the lists with the most thorough thinker, and hold his own. But as long as a particle of insight remains, no one would think of having recourse to this subterfuge. For what is it but an appeal to the opinion of the multitude, of whose applause the philosopher is ashamed, while the popular charlatan glories and confides in it? I should think that Hume might fairly have laid as much claim to common sense as Beattie, and in addition to a critical reason (such as the latter did not possess), which keeps common sense in check and prevents it from speculating, or, if speculations are under discussion restrains the desire to decide because it cannot satisfy itself concerning its own arguments. By this means alone can common sense remain sound. Chisels and hammers may suffice to work a piece of wood, but for steel-engraving we require an engraver's needle. Thus common sense and speculative understanding are each serviceable in their own way, the former in judgments which apply immediately to experience, the latter when we judge universally from mere concepts, as in metaphysics, where sound common sense, so called in spite of the inapplicability of the word, has no right to judge at all.

I openly confess, the suggestion of David Hume was the very thing, which many years ago first interrupted my dogmatic slumber, and gave my investigations in the field of speculative philosophy quite a new direction. I was far from following him in the conclusions at which he arrived by regarding, not the whole of his problem, but a part, which by itself can give us no information. If we start from a well-founded, but undeveloped, thought, which another has bequeathed to us, we may well hope by continued reflection to advance farther than the acute man, to whom we owe the first spark of light.

I therefore first tried whether Hume's objection could not be put into a general form, and soon found that the concept of the connection of cause and effect was by no means the only idea by which the understanding thinks the connection of things a priori, but rather that metaphysics consists altogether of such connections. I sought to ascertain their number, and when I had satisfactorily succeeded in this by starting from a single principle, I proceeded to the deduction of these concepts, which I was now certain were not deduced from experience, as Hume had apprehended, but sprang from the pure understanding. This deduction (which seemed impossible to my acute predecessor, which bad never even occurred to any one else, though no one had hesitated to use the concepts without investigating the basis of their objective validity) was the most difficult task ever undertaken in the service of metaphysics; and the worst was that metaphysics, such as it then existed, could not assist me in the least, because this deduction alone can render metaphysics possible. But as soon as I had succeeded in solving Hume's problem not merely in a particular case, but with respect to the whole faculty of pure reason, I could proceed safely, though slowly, to determine the whole sphere of pure reason completely and from general principles, in its circumference as well as in its contents. This was required for metaphysics in order to construct its system according to a reliable method.

But I fear that the execution of Hume's problem in its widest extent (viz., my Critique of the Pure Reason) will fare as the problem itself fared, when first proposed. It will be misjudged because it is misunderstood, and misunderstood because

men choose to skim through the book, and not to think through it-a disagreeable task, because the work is dry, obscure, opposed to all ordinary notions, and moreover long-winded. I confess, however, I did not expect, to hear from philosophers complaints of want of popularity, entertainment, and facility, when the existence of a highly prized and indispensable cognition is at stake, which cannot be established otherwise, than by the strictest rules of methodic precision. Popularity may follow, but is inadmissible at the beginning. Yet as regards a certain obscurity, arising partly from the diffuseness of the plan, owing to which. the principal points of the investigation are easily lost sight of, the complaint is just, and I intend to remove it by the present Prolegomena.

The first-mentioned work, which discusses the pure faculty of reason in its whole compass and bounds, will remain the foundation, to which the Prolegomena, as a preliminary, exercise, refer; for our critique must first be established as a complete and perfected science, before we can think of letting Metaphysics appear on the scene, or even have the most distant hope of attaining it.

We have been long accustomed to seeing antiquated knowledge produced as new by taking it out of its former context, and reducing it to system in a new suit of any fancy pattern under new titles. Most readers will set out by expecting nothing else from the Critique; but these Prolegomena may persuade him that it is a perfectly new science, of which no one has ever even thought, the very idea of which was unknown, and for which nothing hitherto accomplished can be of the smallest use, except it be the suggestion of Hume's doubts. Yet even he did not suspect such a formal science, but ran his ship ashore, for safety's sake, landing on skepticism, there to let it lie and rot; whereas my object is rather to give it a pilot, who, by means of safe astronomical principles drawn from a knowledge of the globe, and provided with a complete chart and compass, may steer the ship safely, whither he listeth.

If in a new science, which is wholly isolated and unique in its kind, we started with the prejudice that we can judge of things by means of our previously acquired knowledge, which., is precisely what has first to be called in question, we should only fancy we saw everywhere what we had already known,. the expressions, having a similar sound, only that all would appear utterly metamorphosed, senseless and unintelligible, because we should have as a foundation out own notions, made by long habit a second nature, instead of the author's. But the longwindedness of the work, so far as it depends on the subject, and not the exposition, its consequent unavoidable dryness and its scholastic precision are qualities which can only benefit the science, though they may discredit the book.

Few writers are gifted with the subtlety, and at the same time with the grace, of David Hume, or with the depth, as well as the elegance, of Moses Mendelssohn. Yet I flatter myself I might have made my own exposition popular, had my object been merely to sketch out a plan and leave its completion to others instead of having my heart in the welfare of the science, to which I had devoted myself so long; in truth, it required no little constancy, and even self-denial, to postpone the sweets of an immediate success to the prospect of a slower, but more lasting,

reputation.

Making plans is often the occupation of an opulent and boastful mind, which thus obtains the reputation of a creative genius, by demanding what it cannot itself supply; by censuring, what it cannot improve; and by proposing, what it knows not where to find. And yet something more should belong to a sound plan of a general critique of pure reason than mere conjectures, if this plan is to be other than the usual declamations of pious aspirations. But pure reason is a sphere so separate and self-contained, that we cannot touch a part without affecting all the rest. We can therefore do nothing without first determining the position; of each part, and its relation to the rest; for, as our judgment cannot be corrected by anything without, the validity and use of every part depends upon the relation in which it stands to all the rest within the domain of reason.

So in the structure of an organized body, the end of each member can only be deduced from the full conception of the whole. It may, then, be said of such a critique that it is never trustworthy except it be perfectly complete, down to the smallest elements of pure reason. In the sphere of this faculty you can determine either everything or nothing.

But although a mere sketch, preceding the Critique of Pure Reason, would be unintelligible, unreliable, and useless, it is all the more useful as a sequel. For so we are able to grasp the whole, to examine in detail the chief points of importance in the science, and to improve in many respects our exposition, as compared with the first execution of the work.

After the completion of the work I offer here such a plan which is sketched out after an analytical method, while the work itself had to be executed in the synthetical style, in order that the science may present all its articulations, as the structure of a peculiar cognitive faculty, in their natural combination. But should any reader find this plan, which I publish as the Prolegomena to any future Metaphysics, still obscure, let him consider that not every one is bound to study Metaphysics, that many minds will succeed very well, in the exact and even in deep sciences, more closely allied to practical experience,4 while they cannot succeed in investigations dealing exclusively with abstract concepts. In such cases men should apply their talents to other subjects. But he who undertakes to judge, or still more, to construct, a system of Metaphysics, must satisfy the demands here made, either by adopting my solution, or by thoroughly refuting it, and substituting another. To evade it is impossible.

In conclusion, let it be remembered that this much-abused obscurity (frequently serving as a mere pretext under which people hide their own indolence or dullness) has its uses, since all who in other sciences observe a judicious silence, speak authoritatively in metaphysics and make bold decisions, because their ignorance is not here contrasted with the knowledge of others. Yet it does contrast with sound critical principles, which we may therefore commend in the words of Virgil:

> " Ignavum, fucos, pecus a praesepibus arcent. "
> "Bees are defending their hives against drones, those
> indolent creatures. "

PROLEGOMENA.

PREAMBLE ON THE PECULIARITIES OF ALL METAPHYSICAL COGNITION.

Sect. 1: Of the Sources of Metaphysics

If it becomes desirable to formulate any cognition as science, it will be necessary first to determine accurately those peculiar features which no other science has in common with it, constituting its characteristics; otherwise the. boundaries of all sciences become confused, and none of them can be treated thoroughly according to its nature.

The characteristics of a science may consist of a simple difference of object, or of the sources of cognition, or of the kind of cognition, or perhaps of all three conjointly. On this, therefore, depends the idea of a possible science and its territory.

First, as concerns the sources of metaphysical cognition, its very concept implies that they cannot be empirical. Its principles (including not only its maxims but its basic notions) must never be derived from experience. It must not be physical but metaphysical knowledge, viz., knowledge lying beyond experience. It can therefore have for its basis neither external experience, which is the source of physics proper, nor internal, which is the basis of empirical psychology. It is therefore a priori knowledge, coming from pure Understanding and pure Reason.

But so far Metaphysics would not be distinguishable from pure Mathematics; it must therefore be called pure philosophical cognition; and for the meaning of this term I refer to the Critique of the Pure Reason (II. "Method of Transcendentalism," Chap. I., Sec. 1), where the distinction between these two employments of the reason is sufficiently explained. So far concerning the sources of metaphysical cognition.

Sect. 2. Concerning the Kind of Cognition which can alone be called Metaphysical

a. Of the Distinction between Analytical and Synthetical judgments in general. -- The peculiarity of its sources demands that metaphysical cognition must consist of nothing but a priori judgments. But whatever be their origin, or their logical form, there is a distinction in judgments, as to their content, according to which they are either merely explicative, adding nothing to the content of the cognition, or expansive, increasing the given cognition: the former may be called analytical, the latter synthetical, judgments.

Analytical judgments express nothing in the predicate but what has been already actually thought in the concept of the subject, though not so distinctly or with the same (full) consciousness. When I say: All bodies are extended, I have not amplified in the least my concept of body, but have only analyzed it, as extension was really thought to belong to that concept before the judgment was made, though it was not expressed, this judgment is therefore analytical. On the contrary, this judgment, All bodies have weight, contains in its predicate something not

actually thought in the general concept of the body; it amplifies my knowledge by adding something to my concept, and must therefore be called synthetical.

b. The Common Principle of all Analytical Judgments is the Law of Contradiction. -- All analytical judgments depend wholly on the law of Contradiction, and are in their nature a priori cognitions, whether the concepts that supply them with matter be empirical or not. For the predicate of an affirmative analytical judgment is already contained in the concept of the subject, of which it cannot be denied without contradiction. In the same way its opposite is necessarily denied of the subject in an analytical, but negative, judgment, by the same law of contradiction. Such is the nature of the judgments: all bodies are extended, and no bodies are unextended (i. e., simple).

For this very reason all analytical judgments are a .priori even when the concepts are empirical, as, for example, Gold is a yellow metal; for to know this I require no experience beyond my concept of gold as a yellow metal: it is, in fact, the very concept, and I need only analyze it, without looking beyond it elsewhere.

c. Synthetical judgments require a different Principle from the Law of Contradiction.-There are synthetical a posteriori judgments of empirical origin; but there are also others which are proved to be certain a priori, and which spring from pure Understanding and Reason. Yet they both agree in this, that they cannot possibly spring from the principle of analysis, viz., the law of contradiction, alone; they require a quite different principle, though, from whatever they may be deduced, they must be subject to the law of contradiction, which must never be violated, even though everything cannot be deduced from it. I shall first classify synthetical judgments.

1. Empirical judgments are always synthetical. For it would be absurd to base an analytical judgment on experience, as our concept suffices for the purpose without requiring any testimony from experience. That body is extended, is a judgment established a priori, and not an empirical judgment. For before appealing to experience, we already have all the conditions of the judgment in the concept, from which we have but to elicit the predicate according to the law of contradiction, and thereby to become conscious of the necessity of the judgment, which experience could not even teach us.

2. Mathematical judgments are all synthetical. This fact seems hitherto to have altogether escaped the observation of those who have analyzed human reason; it even seems directly opposed to all their conjectures, though incontestably certain, and most important in its consequences. For as it was found that the conclusions of mathematicians all proceed according to the law of contradiction (as is demanded by all apodictic certainty), men persuaded themselves that the fundamental principles were known from the same law. This was a great mistake, for a synthetical proposition can indeed be comprehended according to the law of contradiction, but only by presupposing another synthetical proposition from which it follows, but never in itself.

First of all, we must observe that all proper mathematical

judgments are a priori, and not empirical, because they carry with them necessity, which cannot be obtained from experience. But if this be not conceded to me, very good; I shall confine my assertion pure Mathematics, the very notion of which implies that it contains pure a priori and not empirical cognitions.

It might at first be thought that the proposition 7 + 5 = 12 is a mere analytical judgment, following from the concept of the sum of seven and five, according to the law of contradiction. But on closer examination it appears that the concept of the sum Of 7+5 contains merely their union in a single number, without its being at all thought what the particular number is that unites them. The concept of twelve is by no means thought by merely thinking of the combination of seven and five; and analyze this possible sum as we may, we shall not discover twelve in the concept. We must go beyond these concepts, by calling to our aid some concrete image [Anschauung], i.e., either our five fingers, or five points (as Segner has it in his Arithmetic), and we must add successively the units of the five, given in some concrete image [Anschauung], to the concept of seven. Hence our concept is really amplified by the proposition 7 + 5 = I 2, and we add to the first a second, not thought in it. Arithmetical judgments are therefore synthetical, and the more plainly according as we take larger numbers; for in such cases it is clear that, however closely we analyze our concepts without calling visual images (Anscliauung) to our aid, we can never find the sum by such mere dissection.

All principles of geometry are no less analytical. That a straight line is the shortest path between two points, is a synthetical proposition. For my concept of straight contains nothing of quantity, but only a quality. The attribute of shortness is therefore altogether additional, and cannot be obtained by any analysis of the concept. Here, too, visualization [Anschauung] must come to aid us. It alone makes the synthesis possible.

Some other principles, assumed by geometers, are indeed actually analytical, and depend on the law of contradiction; but they only serve, as identical propositions, as a method of concatenation, and not as principles, e. g., a=a, the whole is equal to itself, or a + b > a, the whole is greater than its part. And yet even these, though they are recognized as valid from mere concepts, are only admitted in mathematics, because they can be represented in some visual form [Anschauung]. What usually makes us believe that the predicate of such apodictic5 judgments is already contained in our concept, and that the judgment is therefore analytical, is the duplicity of the expression, requesting us to think a certain predicate as of necessity implied in the thought of a given concept, which necessity attaches to the concept. But the question is not what we are requested to join in thought to the given concept, but what we actually think together with and in it, though obscurely; and so it appears that the predicate belongs to these concepts necessarily indeed, yet not directly but indirectly by an added visualization [Anschauung].

Sect. 3. A Remark on the General Division of judgments into Analytical and Synthetical

This division is indispensable, as concerns the Critique of human understanding, and therefore deserves to be called classical, though otherwise it is of little use, but this is the reason why dogmatic philosophers, who always seek the sources of metaphysical judgments in Metaphysics itself, and not apart from it, in the pure laws of reason generally, altogether neglected this apparently obvious distinction. Thus the celebrated Wolf, and his acute follower Baumgarten, came to seek the proof of the principle of Sufficient Reason, which is clearly synthetical, in the principle of Contradiction. In Locke's Essay, however, I find an indication of my division. For in the fourth book (chap. iii. Sect. 9, seq.), having discussed the various connections of representations in judgments, and their sources, one of which he makes -I identity and contradiction" (analytical judgments), and another the coexistence of representations in a subject, he confesses (Sect. 10) that our a priori knowledge of the latter is very narrow, and almost nothing. But in his remarks on this species of cognition, there is so little of what is definite, and reduced to rules, that we cannot wonder if no one, not even Hume, was led to make investigations concerning this sort of judgments. For such general and yet definite principles are not easily learned from other men, who have had them obscurely in their minds. We must hit on them first by our own reflection, then we find them elsewhere, where we could not possibly nave found them at first, because the authors themselves did not know that such an idea lay at the basis of their observations. Men who never think independently have nevertheless the acuteness to discover everything, after it has been once shown them, in what was said long since, though no one ever saw it there before.

Sect. 4. The General Question of the Prolegemena. - Is Metaphysics at all Possible?

Were a metaphysics, which could maintain its place as a science, really in existence; could we say, here is metaphysics, learn it, and it will convince you irresistibly and irrevocably of its truth: this question would be useless, and there would only remain that other question (which would rather be a test of our acuteness, than a proof of the existence of the thing itself), "How is the science possible, and how does reason come to attain it?" But human reason has not been so fortunate in this case. There is no single book to which you can point as you do to Euclid, and say: This is Metaphysics; here you may find the noblest objects of this science, the knowledge of a highest Being, and of a future existence, proved from principles of pure reason. We can be shown indeed many judgments, demonstrably certain, and never questioned; but these are all analytical, and rather concern the materials and the scaffolding for Metaphysics, than the extension of knowledge, which is our proper object in studying it (Sect 2). Even supposing you produce synthetical judgments (such as the law of Sufficient Reason, which you have never proved, as you ought to, from pure reason a priori, though we gladly concede its truth), you lapse when they come to be employed for your principal object, into such doubtful assertions, that in all ages one Metaphysics has contradicted another, either in its assertions, or their proofs, and thus has itself destroyed its own claim to lasting assent. Nay, the very attempts to set up such a science are the main cause of the early appearance of skepticism, a mental attitude in which reason treats itself with such violence that it could never have arisen save from complete despair of ever satisfying our most important

aspirations. For long before men began to inquire into nature methodically, they consulted abstract reason, which had to some extent been exercised by means of ordinary experience; for reason is ever present, while laws of nature must usually be discovered with labor. So Metaphysics floated to the surface, like foam, which dissolved the moment it was scooped off. But immediately there appeared a new supply on the surface, to be ever eagerly gathered up by some, while others, instead of seeking in the depths the cause of the phenomenon, thought they showed their wisdom by ridiculing the idle labor of their neighbors.

The essential and distinguishing feature of pure mathematical cognition among all other a priori cognitions is, that it cannot at all proceed from concepts, but only by means of the construction of concepts (see Critique II., Method of Transcendentalism, Chap. I., sect. 1). As therefore in its judgments it must proceed beyond the concept to that which its corresponding visualization [Anschauung] contains, these judgments neither can, nor ought to, arise analytically, by dissecting the concept, but are all synthetical.

I cannot refrain from pointing out the disadvantage resulting to philosophy from the neglect of this easy and apparently insignificant observation. Hume being prompted (a task worthy of a philosopher) to cast his eye over the whole field of a priori cognitions in which human understanding claims such mighty possessions, heedlessly severed from it a whole, and indeed its most valuable, province, viz., pure mathematics; for he thought its nature, or, so to speak, the state-constitution of this empire, depended on totally different principles, namely, on the law of contradiction alone; and although he did not divide judgments in this manner formally and universally as I have done here, what he said was equivalent to this: that mathematics contains only analytical, but metaphysics synthetical, a priori judgments. In this, however, he was greatly mistaken, and the mistake had a decidedly injurious effect upon his whole conception. But for this, he would have extended his question concerning the origin of our synthetical judgments far beyond the metaphysical concept of Causality, and included in it the possibility of mathematics a priori also, for this latter he must have assumed to be equally synthetical. And then he could not have based his metaphysical judgments on mere experience without subjecting the axioms of mathematics equally to experience, a thing which he was far too acute to do. The good company into which metaphysics would thus have been brought, would have saved it from the danger of a contemptuous ill-treatment, for the thrust intended for it must have reached mathematics, which was not and could not have been Hume's intention. Thus that acute man would have been led into considerations which must needs be similar to those that now occupy us, but which would have gained inestimably by his inimitably elegant style.

Metaphysical judgments, properly so called, are all synthetical. We must distinguish judgments pertaining to metaphysics from metaphysical judgments properly so called. Many of the former are analytical, but they only afford the means for metaphysical judgments, which are the whole end of the science, and which are always synthetical. For if there be concepts pertaining to metaphysics (as, for example, that of substance), the judgments springing from simple analysis of them also pertain to metaphysics, as, for example, substance is that which only

exists as subject; and by means of several such analytical judgments, we seek to approach the definition of the concept. But as the analysis of a pure concept of the understanding pertaining to metaphysics, does not proceed in any different manner from the dissection of any other, even empirical, concepts, not pertaining to metaphysics (such as: air is an elastic fluid, the elasticity of which is not destroyed by any known degree of cold), it follows that the concept indeed, but not the analytical judgment, is properly metaphysical. This science has something peculiar in the production of its a priori cognitions, which must therefore be distinguished from the features it has in common with other rational knowledge. Thus the judgment, that all the substance in things is permanent, is a synthetical and properly metaphysical judgment.

If the a priori principles, which constitute the materials of metaphysics, have first been collected according to fixed principles, then their analysis will be of great value; it might be taught as a particular part (as a philosophia definitiva), containing nothing but analytical judgments pertaining to metaphysics, and could be treated separately from the synthetical which constitute metaphysics proper. For indeed these analyses are not elsewhere of much value, except in metaphysics, i.e., as regards the synthetical judgments, which are to be generated by these previously analyzed concepts.

The conclusion drawn in this section then is, that metaphysics is properly concerned with synthetical propositions a priori, and these alone constitute its end, for which it indeed requires various dissections of its concepts, viz., of its analytical judgments, but wherein the procedure is not different from that in every other kind of knowledge, in which we merely seek to render our concepts distinct by analysis. But the generation of a priori cognition by concrete images as well as by concepts, in fine of synthetical propositions a priori in philosophical cognition, constitutes the essential subject of Metaphysics.

Weary therefore as well of dogmatism, which teaches us nothing, as of skepticism, which does not even promise us anything, not even the quiet state of a contented ignorance; disquieted by the importance of knowledge so much needed; and lastly, rendered suspicious by long experience of all knowledge which we believe we possess, or which offers itself, under the title of pure reason: there remains but one critical question on the answer to which our future procedure depends, viz., Is Metaphysics at all possible? But this question must be answered not by skeptical objections to the asseverations of some actual system of metaphysics (for we do not as yet admit such a thing to exist), but from the conception, as yet only problematical, of a science of this sort.

In the Critique of Pure Reason I have treated this question synthetically, by making inquiries into pure reason itself, and endeavoring in this source to determine the elements as well as the laws of its pure use according to principles. The task is difficult, and requires a resolute reader to penetrate by degrees into a system, based on no data except reason itself, and which therefore seeks, without resting upon any fact, to unfold knowledge from its original germs. Prolegomena, however, are designed for preparatory exercises; they are intended rather to

point out what we have to do in order if possible to actualize a science, than to propound it. They must therefore rest upon something already known as trustworthy, from which we can set out with confidence, and ascend to sources as yet unknown, the discovery of which will not only explain to us what we knew, but exhibit a sphere of many cognitions which all spring from the same sources. The method of Prolegomena, especially of those designed as a preparation for future metaphysics, is consequently analytical.

But it happens fortunately, that though we cannot assume metaphysics to be an actual science, we can say with confidence that certain pure a priori synthetical cognitions, pure Mathematics and pure Physics are actual and given; for both contain propositions, which are thoroughly recognized as apodictically certain, partly by mere reason, partly by general consent arising from experience, and yet as independent of experience. We have therefore some at least uncontested synthetical knowledge a priori, and need not ask whether it be possible, for it is actual, but how it is possible, in order that we may deduce from the principle which makes the given cognitions possible the possibility of all the rest.

Sect. 5. The General Problem: How is Cognition from Pure Reason Possible?

We have above learned the significant distinction between analytical and synthetical judgments. The possibility of analytical propositions was easily comprehended, being entirely founded on the law of Contradiction. The possibility of synthetical a posteriori judgments, of those which are gathered from experience, also requires no particular explanation; for experience is nothing but a continual synthesis of perceptions. There remain therefore only synthetical propositions a priori, of which the possibility must be sought or investigated, because they must depend upon other principles than the law of contradiction.

But here we need not first establish the possibility of such propositions so as to ask whether they are possible. For there are enough of them which indeed are of undoubted certainty, and as our present method is analytical, we shall start from the fact, that such synthetical but purely rational cognition actually exists; but we must now inquire into the reason of this possibility, and ask, how such cognition is possible, in order that we may from the principles of its possibility be enabled to determine the conditions of its use, its sphere and its limits. The proper problem upon which all depends, when expressed with scholastic precision, is therefore: How are Synthethetic Propositions a priori possible?

For the sake of popularity I have above expressed this problem somewhat differently, as an inquiry into purely rational cognition, which I could do for once without detriment to the desired comprehension, because, as we have only to do here with metaphysics and its sources, the reader will, I hope, after the foregoing remarks, keep in mind that when we speak of purely rational cognition, we do not mean analytical, but synthetical cognition.6

Metaphysics stands or falls with the solution of this

problem: its very existence depends upon it. Let any one make metaphysical assertions with ever so much plausibility, let him overwhelm us with conclusions, if he has not previously proved able to answer this question satisfactorily, I have a right to say this is all vain baseless philosophy and false wisdom. You speak through pure reason, and claim, as it were to create cognitions a priori. by not only dissecting given concepts, but also by asserting connections which do not rest upon the law of contradiction, and which you believe you conceive quite independently of all experience; how do you arrive at this, and how will you justify your pretensions? An appeal to the consent of the common sense of mankind cannot be allowed; for that is a witness whose authority depends merely upon rumor. Says Horace:

" Quodcunque ostendis mihi sic, incredulus odi."
"To all that which thou provest me thus, I refuse to give credence. "

The answer to this question, though indispensable, is difficult; and though the principal reason that it was not made long ago is, that the possibility of the question never occurred to anybody, there is yet another reason, which is this that a satisfactory answer to this one question requires a much more persistent, profound, and painstaking reflection, than the most diffuse work on Metaphysics, which on its first appearance promised immortality to its author. And every intelligent reader, when he carefully reflects what this problem requires, must at first be struck with its difficulty, and would regard it as insoluble and even impossible, did there not actually exist pure synthetical cognitions a priori. This actually happened to David Hume, though he did not conceive the question in its entire universality as is done here, and as must be done, should the answer be decisive for all Metaphysics. For how is it possible, says that acute man, that when a concept is given me, I can go beyond it and connect with it another, which is not contained in it, in such a manner as if the latter necessarily belonged to the former? Nothing but experience can furnish us with such connections (thus he concluded from the difficulty which he took to be an impossibility), and all that vaunted necessity, or, what is the same thing, all cognition assumed to be a priori, is nothing but a long habit of accepting something as true, and hence of mistaking subjective necessity for objective.

Should my reader complain of the difficulty and the trouble which I occasion him in the solution of this problem, he is at liberty to solve it himself in an easier way. Perhaps he will then feel under obligation to the person who has undertaken for him a labor of so profound research, and will rather be surprised at the facility with which, considering the nature of the subject, the solution has been attained. Yet it has cost years of work to solve the problem in its whole universality (using the term in the mathematical sense, viz., for that which is sufficient for all cases), and finally to exhibit it in the analytical form, as the reader finds it here.

All metaphysicians are therefore solemnly and legally suspended from their occupations till they shall have answered in a satisfactory manner the question, "How are synthetic cognitions a priori possible?" For the answer contains the only credentials which they must show when they have anything to offer in the name of pure reason. But if they do not possess these credentials,

they can expect nothing else of reasonable people, who have been deceived so often, than to be dismissed without further ado.

If they on the other hand desire to carry on their business, not as a science, but as an art of wholesome oratory suited to the common sense of man, they cannot in justice be prevented. They will then speak the modest language of a rational belief, they will grant that they are not allowed even to conjecture, far less to know, anything which lies beyond the bounds of all possible experience, but only to assume (not for speculative use, which they must abandon, but for practical purposes only) the existence of something that is possible and even indispensable for the guidance of the understanding and of the will in life. In this mariner alone can they be called useful and wise men, and the more so as they renounce the title of metaphysicians; for the latter profess to be speculative philosophers, and since, when judgments a prior: are under discussion, poor probabilities cannot be admitted (for what is declared to be known a priori is thereby announced as necessary), such men cannot be permitted to play with conjectures, but their assertions must be either science, or are worth nothing at all.

It may be said, that the entire transcendental philosophy, which necessarily precedes all metaphysics, is nothing but the complete solution of the problem here propounded, in systematical order and completeness, and hitherto we have never had any transcendental philosophy; for what goes by its name is properly a part of metaphysics, whereas the former sciences intended first to constitute the possibility of the 'matter, and must therefore precede all metaphysics. And it is not surprising that when a whole science, deprived of all help from other sciences, and consequently in itself quite new, is required to answer a -single question satisfactorily, we should find the answer troublesome and difficult, nay even shrouded in obscurity.

As we now proceed to this solution according to the analytical method, in which we assume that such cognitions from pure reasons actually exist, we can only appeal to two sciences of theoretical cognition . which alone is under consideration here), pure mathematics and pure natural science (physics). For these alone can exhibit to us objects in a definite and actualizable form (in der Anschauung), and consequently (if there should occur in them a cognition a priori) can show the truth or conformity of the cognition to the object in concrete, that is, its actuality, from which we could proceed to the reason of its possibility by the analytic method. This facilitates our work greatly for here universal considerations are not only applied to facts, but even start from them, while in a synthetic procedure they must strictly be derived in abstracts from concepts.

But, in order to rise from these actual and at the same time well-grounded pure cognitions a priori to such a possible cognition of the same as we are seeking, viz., to metaphysics as a science, we must comprehend that which occasions it, I mean the mere natural, though in spite of its truth not unsuspected, cognition a priori which lies at the bottom of that science, the elaboration of which without any critical investigation of its possibility is commonly called metaphysics. In a word, we must comprehend the natural conditions of such a science as a part of our inquiry, and thus the transcendental problem will be gradually answered by a division into four questions:

1. How is pure mathematics possible?
2. How is pure natural science possible?
3. How is metaphysics in general possible?
4. How is metaphysics as a science possible?

It may be seen that the solution of these problems, though chiefly designed to exhibit the essential matter of the Critique, has yet something peculiar, which for itself alone deserves attention. This is the search for the sources of given sciences in reason itself, so that its faculty of knowing something a priori may by its own deeds be investigated and measured. By this procedure these sciences gain, if not with regard to their contents, yet as to their proper use, and while they throw light on the higher question concerning their common origin, they give, at the same time, an occasion better to explain their own nature.

* * * *

FIRST PART OF THE TRANSCENDENTAL PROBLEM:
HOW IS PURE MATHEMATICS POSSIBLE?

Here is a great and established branch of knowledge, encompassing even now a wonderfully large domain and promising an unlimited extension in the future. Yet it carries with it thoroughly apodictical certainty, i.e., absolute necessity, which therefore rests upon no empirical grounds. Consequently it is a pure product of reason, and moreover is thoroughly synthetical. [Here the question arises:] "How then is it possible for human reason to produce a cognition of this nature entirely a priori?"

Does not this faculty [which produces mathematics], as it neither is nor can be based upon experience, presuppose some ground of cognition a priori, which lies deeply hidden, b,.--, which might reveal itself by these its effects, if their first beginnings were but diligently ferreted out?

Sect. 7. But we find that all mathematical cognition has this peculiarity: it must first exhibit its concept in a visual form [Anschauung] and indeed a priori, therefore in a visual form which is not empirical, but pure. Without this mathematics cannot take a single step; hence its judgments are always visual, viz., "Intuitive"; whereas philosophy must be satisfied with discursive judgments from mere concepts, and though it may illustrate its doctrines through a visual figure, can never derive them from it. This observation on the nature of mathematics gives us a clue to the first and highest condition of its possibility, which is, that some non-sensuous visualization [called pure intuition, or reine Anschauung] must form its basis, in which all its concepts can be exhibited or constructed, in concrete and yet a priori. If we can find out this pure intuition and its possibility, we may thence easily explain how synthetical propositions a priori are possible in pure mathematics, and consequently how this science itself is possible. Empirical intuition [viz., sense-perception] enables us without difficulty to enlarge the concept which we frame of an object of intuition [or sense-perception], by new predicates, which intuition [i.e., sense-perception] itself presents synthetically in experience. Pure intuition [viz., the visualization of forms in our imagination, from which every thing sensual, i.e., every thought of material qualities, is excluded] does so likewise, only with this difference, that in the latter

case the synthetical judgment is a priori certain and apodictical, in the former, only a posteriori and empirically certain; because this latter contains only that which occurs in contingent empirical intuition, but the former, that which must necessarily be discovered in pure intuition. He.-e intuition, being an intuition a priori, is before all experience, viz., before any perception of particular objects, inseparably conjoined with its concept.

Sect. 8. But with this step our perplexity seems rather to increase than to lessen. For the question now is, "How is it possible to intuit [in a visual form] anything a priori" An intuition [viz., a visual sense perception] is such a representation as immediately depends upon the presence of the object. Hence it seems impossible to intuit from the outset a priori, because intuition would in that event take place without either a former or a present object to refer to, and by consequence could not be intuition. Concepts indeed are such, that we can easily form some of them a priori, viz., such as contain nothing but the thought of an object in general; and we need not find ourselves in an immediate relation to the object. Take, for instance, the concepts of Quantity, of Cause, etc. But even these require, in order to make them understood, a certain concrete use-that is, an application to some sense-experience [Anschauung], by which an object of them is given us. But how can the intuition of the object [its visualization] precede the object itself?

Sect. 9. If our intuition [i.e., our sense-experience] were perforce of such a nature as to represent things as they are in themselves, there would not be any intuition a priori, but intuition would be always empirical. For I can only know what is contained in the object in itself when it is present and given to me. It is indeed even then incomprehensible how the visualizing [Anschauung] of a present thing should make me know this thing as it is in itself, as its properties cannot migrate into my faculty of representation. But even granting this possibility, a visualizing of that sort would not take place a priori, that is, before the object were presented to me; for without this latter fact no reason of a relation between my representation and the object can be imagined, unless it depend upon a direct inspiration.

Therefore in one way only can my intuition [Anschauung] anticipate the actuality of the object, and be a cognition a priori, viz.: if my intuition contains nothing but the form of sensibility, antedating in my subjectivity all the actual impressions through which I am affected by objects.

For that objects of sense can only be intuitd according to this form of sensibility I can know a priori. Hence it follows: that propositions, which concern this form of sensuous intuition only, are possible and valid for objects of the senses; as also, conversely, that intuitions which are possible a priori can never concern any other things than objects of our senses.7

Sect. 10. Accordingly, it is only the form of sensuous intuition by which we can intuit things a priori, but by which we can know objects only as they appear to us (to our senses), not as they are in themselves; and this assumption is absolutely necessary if synthetical propositions a priori be granted as

possible, or if, in case they actually occur, their possibility is to be comprehended and determined beforehand.

Now, the intuitions which pure mathematics lays at the foundation of all its cognitions and judgments which appear at once apodictic and necessary are Space and Time. For mathematics must first have all its concepts in intuition, and pure mathematics in pure intuition, that is, it must construct them. If it proceeded in any other way, it would be impossible to make any headway, for mathematics proceeds, not analytically by dissection of concepts, but synthetically, and if pure intuition be wanting, there is nothing in which the matter for synthetical judgments a priori can be given. Geometry is based upon the pure intuition of space. Arithmetic accomplishes its concept of number by the successive addition of units in time; and pure mechanics especially cannot attain its concepts of motion without employing the representation of time. Both representations, however, are only intuitions; for if we omit from the empirical intuitions of bodies and their alterations (motion) everything empirical, or belonging to sensation, space and time still remain, which are therefore pure intuitions that lie a priori at the basis of the empirical. Hence they can never be omitted, but at the same time, by their being pure intuitions a priori, they prove that they are mere forms of our sensibility, which must precede all empirical intuition, or perception of actual objects, and conformably to which objects can be known a priori, but only as they appear to us.

Sect. 11. The problem of the present section is therefore solved. Pure mathematics, as synthetical cognition a priori, is only possible by referring to no other objects than those of the senses. At the basis of their empirical intuition lies a pure intuition (of space and of time) which is a priori. This is possible, because the latter intuition is nothing but the mere form of sensibility, which precedes the actual appearance of the objects, in, that it, in fact, makes them possible. Yet this faculty of intuiting a priori affects not the matter of the phenomenon (that is, the sense-element in it, for this constitutes that which is empirical), but its form, viz., space and time. Should any man venture to doubt that these are determinations adhering not to things in themselves, but to their relation to our sensibility, I should be glad to know how it can be possible to know the constitution of things a priori, viz., before we have any acquaintance with them and before they are presented to us. Such, however, is the case with space and time. But this is quite comprehensible as soon as both count for nothing more than formal conditions of our sensibility, while the objects count merely as phenomena; for then the form of the phenomenon, i.e., pure intuition, can by all means be represented as proceeding from ourselves, that is, a priori.

Sect. 12. In order to add something by way of illustration and confirmation, we need only watch the ordinary and necessary procedure of geometers. All proofs of the complete congruence of two given figures (where the one can in every respect be substituted for the other) come ultimately to this that they may be made to coincide; which is evidently nothing else than a synthetical proposition resting upon immediate intuition, and this intuition must be pure, or given a priori, otherwise the proposition could not rank as apodictically certain, but would have empirical certainty only. In that case, it could only be

said that it is always found to be so, and holds good only as far as our perception reaches. That everywhere space (which (in its entirety] is itself no longer the boundary of another space) has three dimensions, and that space cannot in any way have more, is based on the proposition that not more than three lines can intersect at right angles in one point; but this proposition cannot by any means be shown from concepts, but rests immediately on intuition, and indeed on pure and a priori intuition, because it is apodictically certain. That we can require a line to be drawn to infinity (in indefinitum), or that a series of changes (for example, spaces traversed by motion) shall be infinitely continued, presupposes a representation of space and time, which can only attach to intuition, namely, so far as it in itself is bounded by nothing, for from concepts it could never be inferred. Consequently, the basis of mathematics actually are pure intuitions, which make its synthetical and apodictically valid propositions possible. Hence our transcendental deduction of the notions of space and of time explains at the same time the possibility of pure mathematics. Without some such deduction its truth may be granted, but its existence could by no means be understood, and we must assume II that everything which can be given to our senses (to the external senses in space, to the internal one in time) is intuitd by us as it appears to us, not as it is in itself."

Sect. 13. Those who cannot yet rid themselves of the notion that space and time are actual qualities inhering in things in themselves, may exercise their acumen on the following paradox. When they have in vain attempted its solution, and are free from prejudices at least for a few moments, they will suspect that the degradation of space and of time to mere forms of @ur sensuous intuition may perhaps be well founded,

If two things are quite equal in all respects ask much as can be ascertained by all means possible, quantitatively and qualitatively, it must follow, that the one can in all cases and under all circumstances replace the other, and this substitution would not occasion the least perceptible difference. This in fact is true of plane figures in geometry; but some spherical figures exhibit, notwithstanding a complete internal agreement, such a contrast in their external relation, that the one figure cannot possibly be put in the place of the other. For instance, two spherical triangles on opposite hemispheres, which have an arc of the equator as their common base, may be quite equal, both as regards sides and angles, so that nothing is to be found in either, if it be described for itself alone and completed, that would not equally be applicable to both; and yet the one cannot be put in the place of the other (being situated upon the opposite hemisphere). Here then is an internal difference between the two triangles, which difference our understanding cannot describe as internal, and which only manifests itself by external relations in space.

But I shall adduce examples, taken from common life, that are more obvious still.

What can be more similar in every respect and in every part more alike to my hand and to my ear, than their images in a mirror? And yet I cannot put such a hand as is seen in the glass in the place of its archetype; for if this is a right hand, that in the glass is a left one, and the image or reflection of the

right ear is a left one which never can serve as a substitute for the other. There are in this case no internal differences which our understanding could determine by thinking alone. Yet the differences are internal as the senses teach, for, notwithstanding their complete equality and similarity, the left hand cannot be enclosed in the same bounds as the right one (they are not congruent); the glove of one hand cannot be used for the other. What is the solution? These objects are not representations of things as they are in themselves, and as the pure understanding would know them, but sensuous intuitions, that is, appearances, the possibility of which rests upon the relation of certain things unknown in themselves to something else, viz., to our sensibility. Space is the form of the external intuition of this sensibility, and the internal determination of every space is only possible by the determination of its external relation to the whole space, of which it is a part (in other words, by its relation to the external sense). That is to say, the part is only possible through the whole, which is never the case with things in themselves, as objects of the mere understanding, but with appearances only. Hence the difference between similar and equal things, which are yet not congruent (for instance, two symmetric helices), cannot be made intelligible by any concept, but only by the relation to the right and the left hands which immediately refers to intuition.

REMARK 1.

Pure Mathematics, and especially pure geometry, can only have objective reality on condition that they refer to objects of sense. But in regard to the latter the principle holds good, that our sense representation is not a representation of things in themselves but of the way in which they appear to us. Hence it follows, that the propositions of geometry are not the results of a mere creation of our poetic imagination, and that therefore they cannot be referred with assurance to actual objects; but rather that they are necessarily valid of space, and consequently of all that may be found in space, because space is nothing else than the form of all external appearances, and it is this form alone in which objects of sense can be given. Sensibility, the form of which is the basis of geometry, is that upon which the possibility of external appearance depends. Therefore these appearances can never contain anything but what geometry prescribes to them.

It would be quite otherwise if the senses were so constituted as to represent objects as they are in themselves. For then it would not by any means follow from the conception of space, which with all its properties serves to the geometer as an a priori foundation, together with what is thence inferred, must be so in nature. The space of the geometer would be considered a mere fiction, and it would not be credited with objective validity, because we cannot see how things must of necessity agree with an image of them, which we make spontaneously and previous to our acquaintance with them. But if this image, or rather this formal intuition, is the essential property of our sensibility, by means of which alone objects are given to us, and if this sensibility represents not things in themselves, but their appearances: we shall easily comprehend, and at the same time indisputably prove, that all external objects of our world of sense must necessarily coincide in the most rigorous way with the propositions of geometry; because sensibility by means of its

form of external intuition, viz., by space, the same with which the geometer is occupied, makes those objects at all possible as mere appearances.

It will always remain a remarkable phenomenon in the history of philosophy, that there was a time, when even mathematicians, who at the same time were philosophers, began to doubt, not of the accuracy of their geometrical propositions so far as they concerned space, but of their objective validity and the applicability of this concept itself, and of all its corollaries, to nature. They showed much concern whether a-line in nature might not consist of physical points, and consequently that true space in the object might consist of simple [discrete] parts, while the space which the geometer has in his mind [being continuous] cannot be such. They did not recognize that this mental space renders possible the physical space, i.e., the extension of matter; that this pure space is not at all a quality of things in themselves, but a form of our sensuous faculty of representation; and that all objects in space are mere appearances, i.e., not things in themselves but representations of our sensuous intuition. But such is the case, for the space of the geometer is exactly the form of sensuous intuition which we find a priori in us, and contains the ground of the possibility of all external appearances (according to their form), and the latter must necessarily and most rigidly agree with the propositions of the geometer, which he draws not from any fictitious concept, but from the subjective basis of all external phenomena, which is sensibility itself. In this and no other way can geometry be made secure as to the undoubted objective reality of its propositions against all the intrigues of a shallow Metaphysics, which is surprised at them [the geometrical propositions], because it has not traced them to the sources of their concepts.

REMARK II.

Whatever is given us as object, must be given us in intuition. All our intuition however takes place by means of the senses only; the understanding intuits nothing, but only reflects. And as we have just shown that the senses never and in no manner enable us to know things in themselves, but only their appearances, which are mere representations of the sensibility, we conclude that all bodies, together with the space in which they are, must be considered nothing but mere representations in us, and exist nowhere but in our thoughts.' You will say: Is not this manifest idealism?

Idealism consists in the assertion, that there are none but thinking beings, all other things, which we think are perceived in intuition, being nothing but representations in the thinking beings, to which no object external to them corresponds in fact. Whereas I say, that things as objects of our senses existing outside us are given, but we know nothing of what they may be in themselves, knowing only their appearances, 1. e., the representations which they cause in us by affecting our senses. Consequently I grant by all means that there are bodies without us, that is, things which, though quite unknown to us as to what they are in themselves, we yet know by the representations which their influence on our sensibility procures us, and which we call bodies, a term signifying merely the appearance of the thing which is unknown to us, but not therefore less actual. Can this

be termed idealism? It is the very contrary.

Long before Locke's time, but assuredly since him, it has been generally assumed and granted without detriment to the actual existence of external things, that many of their predicates may be said to belong not to the things in themselves, but to their appearances, and to have no proper existence outside our representation. Heat, color, and taste, for instance, are of this kind. Now, if I go farther, and for weighty reasons rank as mere appearances the remaining qualities of bodies also, which are called primary, such as extension, place, and in general space, with all that which belongs to it (impenetrability or materiality, space, etc.)-no one in the least can adduce the reason of its being inadmissible. As little as the man who admits colors not to be properties of the object in itself, but only as modifications of the sense of sight, should on that account be called an idealist, so little can my system be named idealistic, merely because I find that more, nay, A11 the properties which constitute the intuition of a body belong merely to its appearance.

The existence of the thing that appears is thereby not destroyed, as in genuine idealism, but it is only shown, that we cannot possibly know it by the senses as it is in itself.

I should be glad to know what my assertions must be in order to avoid all idealism. Undoubtedly, I should say, that the representation of space is not only perfectly conformable to the relation which our sensibility has to objects-that I have said- but that it is quite similar to the object,-an assertion in which I can find as little meaning as if I said that the sensation of red has a similarity to the property of vermilion, which in me excites this sensation.

REMARK III.

Hence we may at once dismiss an easily foreseen but futile objection, "that by admitting the ideality of space and of time the whole sensible world would be turned into mere sham." At first all philosophical insight into the nature of sensuous cognition was spoiled, by making the sensibility merely a confused mode of representation, according to which we still know things as they are, but without being able to reduce everything in this our representation to a clear consciousness; whereas proof is offered by us that sensibility consists, not in this logical distinction of clearness and obscurity, but in the genetical one of the origin of cognition itself. For sensuous perception represents things not at all as they are, but only the mode in which they affect our senses, and consequently by sensuous perception appearances only and not things themselves are given to the understanding for reflection. After this necessary corrective, an objection rises from an unpardonable and almost intentional misconception, as if my doctrine turned all the things of the world of sense into mere illusion.

When an appearance is given us, we are still quite free as to how we should judge the matter. The appearance depends upon the senses, but the judgment upon the understanding, and the only question is, whether in the determination of the object there is truth or not. But the difference between truth and dreaming is not ascertained by the nature of the representations, which are

referred to objects (for they are the same in both cases), but by their connection according to those rules, which determine the coherence of the representations in the concept of an object, and by ascertaining whether they can subsist together in experience or not. And it is not the fault of the appearances if our cognition takes illusion for truth, i.e., if the intuition, by which an object is given us, is considered a concept of the thing or of its existence also, which the understanding can only think. The senses represent to us the paths of the planets as now progressive, now retrogressive, and herein is neither falsehood nor truth, because as long as we hold this path to be nothing but appearance, we do not judge of the objective nature of their motion. But as a false judgment may easily arise when the understanding is not on its guard against this subjective mode of representation being considered objective, we say they appear to move backward; it is not the senses however which must be charged with the illusion, but the understanding, whose province alone it is to give an objective judgment on appearances.

Thus, even if we did not at all reflect on the origin of our representations, whenever we connect our intuitions of sense (whatever they may contain), in space and in time, according to the rules of the coherence of all cognition in experience, illusion or truth will arise according as we are negligent or careful. It is merely a question of the use of sensuous representations in the understanding, and not of their origin. In the same way, if I consider all the representations of the senses, together with their form, space and time, to be nothing but appearances, and space and time to be a mere form of the sensibility, which is not to be met with in objects out of it, and if I make use of these representations in reference to possible experience only, there is nothing in my regarding them as appearances that can lead astray or cause illusion. For all that they can correctly cohere according to rules of truth in experience. Thus all the propositions of geometry hold good of space as well as of all the objects of the senses, consequently of all possible experience, whether I consider space as a mere form of the sensibility, or as something cleaving to the things themselves. In the former case however I comprehend how I can know a priori these propositions concerning all the objects of external intuition. Otherwise, everything else as regards all possible experience remains just as if I had not departed from the vulgar view.

But if I venture to go beyond all possible experience with my notions of space and time, which I cannot refrain from doing if I proclaim them qualities inherent in things in themselves (for what should prevent me from letting them hold good of the same things, even though my senses might be different, and unsuited to them?), then a grave error may arise due to illusion, for thus I would proclaim to be universally valid what is merely a subjective condition of the intuition of things and sure only for all objects of sense, viz., for all possible experience; I would refer this condition to things in themselves, and do not limit it to the conditions of experience.

My doctrine of the ideality of space and of time, therefore, far from reducing the whole sensible world to mere illusion, is the only means of securing the application of one of the most important cognitions (that which mathematics propounds a priori) to actual objects, and of preventing its being regarded as mere

illusion. For without this observation it would be quite impossible to make out whether the intuitions of space and time, which we borrow from no experience, and which yet lie in our representation a priori, are not mere phantasms of our brain, to which objects do not correspond, at least not adequately, and consequently, whether we have been able to show its unquestionable validity with regard to all the objects of the sensible world just because they are mere appearances.

Secondly, though these my principles make appearances of the representations of the senses, they are so far from turning the truth of experience into mere illusion, that they are rather the only means of preventing the transcendental illusion, by which metaphysics has hitherto been deceived, leading to the childish endeavor of catching at bubbles, because appearances, which are mere representations, were taken for things in themselves. Here originated the remarkable event of the antimony of Reason which I shall mention by and by, and which is destroyed by the single observation, that appearance, as long as it is employed in experience, produces truth, but the moment it transgresses the bounds of experience, and consequently becomes transcendent, produces nothing but illusion.

Inasmuch therefore, as I leave to things as we obtain them by the senses their actuality, and only limit our sensuous intuition of these things to this, that they represent in no respect, not even in the pure intuitions of space and of time, anything more than mere appearance of those thin-s, but never their constitution in themselves, this is not a sweeping illusion invented for nature by me. My protestation too against all charges of idealism is so valid and clear as even to seem superfluous, were there not incompetent judges, who, while they would have an old name for every deviation from their perverse though common opinion, and never judge of the spirit of philosophic nomenclature, but cling to the letter only, are ready to put their own conceits in the place of well-defined notions, and thereby deform and distort them. I have myself given this my theory the name of transcendental idealism, but that cannot authorize any one to confound it either with the empirical idealism of Descartes, (indeed, his was only an insoluble problem, owing to which he thought every one at liberty to deny the existence of the corporeal world, because it could never be proved satisfactorily), or with the mystical and visionary idealism of Berkeley, against which and other similar phantasms our Critique contains the proper antidote. My idealism concerns not the existence of things (the doubting of which, however, constitutes idealism in the ordinary sense), since it never came into my head to doubt it, but it concerns the sensuous representation of things, to which space and time especially belong. Of these [viz., space and time], consequently of all appearances in general, I have only shown, that they are neither things (but mere modes of representation), nor determinations belonging to things in themselves. But the word "transcendental," which with me means a reference of our cognition, i.e., not to things, but only to the cognitive faculty, was meant to obviate this misconception. Yet rather than give further occasion to it by this word, I now retract it, and desire this idealism of mine to be called critical. But if it be really an objectionable idealism to convert actual thin.-Is (not appearances) into mere representations.. by what name shall we call him who conversely changes mere representations to things? It may, I think, be

called "dreaming idealism," in contradistinction to the former, which may be called "visionary," both of which are to be refuted by my transcendental, or, better, critical idealism.

* * * *

SECOND PART OF THE TRANSCENDENTAL PROBLEM: HOW IS THE SCIENCE OF NATURE POSSIBLE?

Sect. 14. Nature is the existence of things, so far as it is determined according to universal laws. Should nature signify the existence of things in themselves, we could never know it either a priori or a posteriori. Not a priori, for how can we know what belongs to things in themselves, since this never can be done by the dissection of our concepts (in analytical judgments)? We do not want to know what is contained in our concept of a thing (for the [concept describes what] belongs to its logical being), but what is in the actuality of the thing superadded to our concept, and by what the thing itself is determined in its existence outside the concept. Our understanding, and the conditions on which alone it can connect the determinations of things in their existence, do not prescribe any rule to things themselves; these do not conform to our understanding, but it must conform itself to them; they must therefore be first given us in order to gather these determinations from them, wherefore they would not be known a priori.

A cognition of the nature of things in themselves a posteriori would be equally impossible. For, if experience is to teach us laws, to which the existence of things is subject, these laws, if they regard things in themselves, must belong to them of necessity even outside our experience. But experience teaches us what exists and how it exists, but never that it must necessarily exist so and not otherwise. Experience therefore can never teach us the nature of things in themselves.

Sect. 15. We nevertheless actually possess a pure science of nature in which are propounded, a priori and with all the necessity requisite to apodictical propositions, laws to which nature is subject. I need only call to witness that propaedeutic of natural science which, under the title of the universal Science of Nature, precedes all Physics (which is founded upon empirical principles). In it we have Mathematics applied to appearance, and also merely discursive principles (or those derived from concepts), which constitute the philosophical part of the pure cognition of nature. But there are several things in it, which are not quite pure and independent of empirical sources: such as the concept of motion, that of impenetrability (upon which the empirical concept of matter rests), that of inertia, and many others, which prevent its being called a perfectly pure science of nature. Besides, it only refers to objects of the external sense and therefore does not give an example of a universal science of nature, in the strict sense, for such a science must reduce nature in general, whether it regards the object of the external or that of the internal sense (the object of Physics as well as Psychology), to universal laws. But among the principles of this universal physics there are a few which actually have the required universality; for instance, the propositions that "substance is permanent, " and that "every event is determined by a cause according to constant laws," etc.

These are actually universal laws of nature, which subsist completely a priori. There is then in fact a pure science of nature, and the question arises, How is it possible?

Sect. 16. The word "nature" assumes yet another meaning, which determines the object, whereas in the former sense it only denotes the conformity to law [Gesetzmdssigkeit] of the determinations of the existence of things generally. If we consider it materialiter (i.e., in the matter that forms its objects) "nature is the complex of all the objects of experience." And with this only are we now concerned, for besides, things which can never be objects of experience, if they must be known as to their nature, would oblige us to have recourse to concepts whose meaning could never be given in concrete (by any example of possible experience). Consequently we must form for ourselves a list of concepts of their nature, the reality whereof (i.e., whether they actually refer to objects, or are mere creations of thought) could never be determined. The cognition of what cannot be an object of experience would be hyperphysical, and with things hyperphysical we are here not concerned, but only with the cognition of nature, the actuality of which can be confirmed by experience, though it [the cognition of nature] is possible a priori and precedes all experience.

Sect. 17. The formal [aspect] of nature in this narrower sense is therefore the conformity to law of all the objects of experience, and so far as it is known a priori, their necessary conformity. But it has just been shown that the laws of nature can never be known a priori in objects so far as they are considered not in reference to possible experience, but as things in themselves. And our inquiry here extends not to things in themselves (the properties of which we pass by), but to things as objects of possible experience, and the complex of these is what we properly designate as nature. And now I ask, when the possibility of a cognition of nature a priori is in question, whether it is better to arrange the problem thus: How can we know a priori that things as objects of experience necessarily conform to law? or thus: How is it possible to know a priori the necessary conformity to law of experience itself as regards all its objects generally?

Closely considered, the solution of the problem, represented in either way, amounts, with regard to the pure cognition of nature (which is the point of the question at issue), entirely to the same thing. For the subjective laws, under which alone an empirical cognition of things is possible, hold good of these things, as objects of possible experience (not as things in themselves, which are not considered here). Either of the following statements means quite the same: "A judgment of observation can never rank as experience, without the law, that 'whenever an event is observed, it is always referred to some antecedent, which it follows according to a universal rule'"; alternatively, "Everything, of which experience teaches that it happens, must have a cause."

It is, however, more commendable to choose the first formula. For we can a priori and previous to all given objects have a cognition of those conditions, on which alone experience is possible, but never of the laws to which things may in themselves be subject, without reference to possible experience. We cannot therefore study the nature of things a priori otherwise

than by investigating the conditions and the universal (though subjective) laws, under which alone such a cognition as experience (as to mere form) is possible, and we determine accordingly the possibility of things, as objects of experience. For if I should choose the second formula, and seek the conditions a priori, on which nature as an object of experience is possible, I might easily fall into error, and fancy that I was speaking of nature as a thing in itself, and then move round in endless circles, in a vain search for laws concerning things of which nothing is given me.

Accordingly we shall here be concerned with experience only, and the universal conditions of its possibility which are given a priori. Thence we shall determine nature as the whole object of all possible experience. I think it will be understood that I here do not mean the rules of the observation of a nature that is already given, for these already presuppose experience. I do not mean how (through experience) we can study the laws of nature; for these would not then be laws a priori, and would yield us no pure science of nature; but [I mean to ask] how the condi. tions a priori of the possibility of experience are at the same time the sources from which all the universal laws of nature must be derived.

Sect. 18. In the first place we must state that, while all judgments of experience [Erfahrungsurtheile] are empirical (i.e., have their ground in immediate senseperception), vice versa, all empirical judgments [empirische Urtheile] are not judgments of experience, but, besides the empirical, and in general besides what is given to the sensuous intuition, particular concepts must yet be superadded-concepts which have their origin quite a priori in the pure understanding, and under which every perception must be first of all subsumed and then by their means changed into experience.8

Empirical judgments, so far as they have objective validity, are judgments of experience; but those which are only subjectively valid, I name mere judgments of perception. The latter require no pure concept of the understanding, but only the logical connection of perception in a thinking subject. But the former always require, besides the representation of the sensuous intuition, particular concepts originally begotten in the understanding, which produce the objective validity of the judgment of experience.

All our judgments are at first merely judgments of perception; they hold good only for us (i.e., for our subject), and we do not till afterwards give them a new reference (to an object), and desire that they shall always hold good for us and in the same way for everybody else; for when a judgment agrees with an object, all judgments concerning the same object must likewise agree among themselves, and thus the objective validity of the judgment of experience signifies nothing else than its necessary universality of application. And conversely when we have reason to consider a judgment necessarily universal (which never depends upon perception, but upon the pure concept of the understanding, under which the perception is subsumed), we must consider it objective also, that is, that it expresses not merely a reference of our perception to a subject, but a quality of the object. For there would be no reason for the judgments of other men necessarily agreeing with mine, if it were not the unity of

the object to which they all refer, and with which they accord; hence they must all agree with one another.

Sect. 19. Therefore objective validity and necessary universality (for everybody) are equivalent terms, and though we do not know the object in itself, yet when we consider a judgment as universal, and also necessary, we understand it to have objective validity. By this judgment we know the object (though it remains unknown as it is in itself) by the universal and necessary connection of the given perceptions. As this is the case with all objects of sense, judgments of experience take their objective validity not from the immediate cognition of the object (which is impossible), but from the condition of universal validity in empirical judgments, which, as already said, never rests upon empirical, or, in short, sensuous conditions, but upon a pure concept of the understanding. The object always remains unknown in itself; but when by the concept of the understanding the connection of the representations of the object, which are given to our sensibility, is determined as universally valid, the object is determined by this relation, and it is the judgment that is objective.

To illustrate the matter: When we say, "the room is warm, sugar sweet, and wormwood bitter,"9 -- we have only subjectively valid judgments, I do not at all expect that I or any other person shall always find it as I now do; each of these sentences only expresses a relation of two sensations to the same subject, to myself, and that only in my present state of perception; consequently they are not valid of the object. Such are judgments of perception. judgments of experience are of quite a different nature. What experience teaches me under certain circumstances, it must always teach me and everybody; and its validity is not limited to the subject nor to its state at a particular time. Hence I pronounce all such judgments as being objectively valid. For instance, when I say the air is elastic, this judgment is as yet a judgment of perception only-I do nothing but refer two of my sensations to one another. But, if I would have it called a judgment of experience, I require this connection to stand under a condition, which makes it universally valid. I desire therefore that I and everybody else should always connect necessarily the same perceptions under the same circumstances.

Sect. 20. We must consequently analyze experience in order to see what is contained in this product of the senses and of the understanding, and how the judgment of experience itself is possible. The foundation is the intuition of which I become conscious, i.e., perception (perceptio), which pertains merely to the senses. But in the next place, there are acts of judging (which belong only to the understanding). But this judging may be twofold-first, I may merely compare perceptions and connect them in a particular state of my consciousness; or, secondly, I may connect them in consciousness generally. The former judgment is merely a judgment of perception, and of subjective validity only: it is merely a connection of perceptions in my mental state, without reference to the object. Hence it is not, as is commonly imagined, enough for experience to compare perceptions and to connect them in consciousness through judgment; there arises no universality and necessity, for which alone judgments can become objectively valid and be called experience.

Quite another judgment therefore is required before

perception can become experience. The given intuition must be subsumed under a concept, which determines the form of judging in general relatively to the intuition, connects its empirical consciousness in consciousness generally, and thereby procures universal validity for empirical judgments. A concept of this nature is a pure a priori concept of the Understanding, which does nothing but determine for an intuition the general way in which it can be used for judgments. Let the concept be that of cause, then it determined the intuition which is subsumed under it, e.g., that of air, relative to judgments in general, viz., the concept of air serves with regard to its expansion in the relation of antecedent to consequent in a hypothetical judgment. The concept of cause accordingly is a pure concept of the understanding, which is totally disparate from all possible perception, and only serves to determine the representation subsumed under it, relatively to judgments in general, and so to make a universally valid judgment possible.

Before, therefore, a judgment of perception can become a judgment of experience, it is requisite that the perception should be subsumed under some such a concept of the understanding.; for instance, air ranks under the concept of causes, which determines our judgment about it in regard to its expansion as hypothetical.10 Thereby the expansion of the air is represented not as merely belonging to the perception of the air in my present state or in several states of mine, or in the state of perception of others, but as belonging to it necessarily. The judgment, "the air is elastic," becomes universally valid, and a judgment of experience, only by certain judgments preceding it, which subsume the intuition of air under the concept of cause and effect: and they thereby determine the perceptions not merely as regards one another in me, but relatively to the form of judging in general, which is here hypothetical, and in this way they render the empirical judgment universally valid.

If all our synthetical judgments are analyzed so far as they are objectively valid, it will be found that they never consist of mere intuitions connected only (as is commonly believed) by comparison into a judgment; but that they would be impossible were not a pure concept of the understanding superadded to the concepts abstracted from intuition, under which concept these latter are subsumed, and in this manner only combined into an objectively valid judgment. Even the judgments of pure mathematics in their simplest axioms are not exempt from this condition. The principle, II a straight line is the shortest between two points," presupposes that the line is subsumed under the concept of quantity, which certainly is no mere intuition, but bas its seat in the understanding alone, and serves to determine the intuition (of the line) with regard to the judgments which may be made about it, relatively to their quantity, that is, to plurality (as judicia plurativa).11 For under them it is understood that in a given intuition there is contained a plurality of homogenous parts.

Sect. 21. To prove, then, the possibility of experience so far as it rests upon pure concepts of the understanding a priori, we must first represent what belongs to judgments in general and the various functions of the understanding, in a complete table. For the pure concepts of the understanding must run parallel to these functions, as such concepts are nothing more than concepts of intuitions in general, so far as these are determined by one

or other of these functions of judging, in themselves, that is, necessarily and universally. Hereby also the a priori principles of the possibility of all experience, as of an objectively valid empirical cognition, will be precisely determined. For they are nothing but propositions by which all perception is (under certain universal conditions of intuition) subsumed under those pure concepts of the understanding.

LOGICAL TABLE OF JUDGMENTS.

1. As to Quantity.
   Universal.
   Particular.
   Singular.

2. As to Quality.
   Affirmative.
   Negative.
   Infinite.

3. As to Relation.
   Categorical.
   Hypothetical.
   Disjunctive.

4. As to Modality.
   Problematical.
   Assertorical.
   Apodictical.

TRANSCENDENTAL TABLE OF THE PURE CONCEFITS OF THE UNDERSTANDING.

1 . As to Quantity.
   Unity (the Measure).
   Plurality (the Quantity).
   Totality (the Whole).

2. As to Quality.
   Reality.
   Negation.
   Limitation.

3. As to Relation.
   Substance.
   Cause.
   Community.

4. As to Modality.
   Possibility.
   Existence.
   Necessity.

PURE PHYSICAL TABLE OF THE UNIVERSAL PRINCIPLES OF THE SCIENCE OF NATURE.

1. Axioms of Intuition.
2. Anticipations of Perception.
3. Analogies of Experience.
4. Postulates of Empirical Thinking generally.

Sect. 21a. In order to comprise the whole matter in one

idea, it is first necessary to remind the reader that we are discussing not the origin of experience, but of that which lies in experience. The former pertains to empirical psychology, and would even then never be adequately explained without the latter, which belongs to the Critique of cognition, and particularly of the understanding.

Experience consists of intuitions, which belong to the sensibility, and of judgments, which are entirely a work of the understanding. But the judgments, which the understanding forms alone from sensuous intuitions, are far from being judgments of experience. For in the one case the judgment connects only the perceptions as they are given in the sensuous intuition, while in the other the judgments must express what experience in general, and not what the mere perception (which possesses only subjective validity) contains. The judgment of experience must therefore add to the sensuous intuition and its logical connection in a judgment (after it has been rendered universal by comparison) something that determines the synthetical judgment as necessary and therefore as universally valid. This can be nothing else than that concept which represents the intuition as determined in itself with regard to one form of judgment rather than another, viz., a concept of that synthetical unity of intuitions which can only be represented by a given logical function of judgments.

Sect. 22. The sum of the matter is this: the business of the senses is to intuit -- that of the understanding is to think. But thinking is uniting representations in one consciousness. This union originates either merely relative to the subject, and is accidental and subjective, or is absolute, and is necessary or objective. The union of representations in one consciousness is judgment. Thinking therefore is the same as judging, or referring representations to judgments in general. Hence judgments are either merely subjective, when representations are referred to a consciousness in one subject only, and united in it, or objective, when they are united in a consciousness generally, that is, necessarily. The logical functions of all judgments are but various modes of uniting representations in consciousness. But if they serve for concepts, they are concepts of their necessary union in a consciousness, and so principles of objectively valid judgments. This union in a consciousness is either analytical, by identity, or synthetical, by the combination and addition of various representations one to another. Experience consists in the synthetical connection of phenomena (perceptions) in consciousness, so far as this connection is necessary. Hence the pure concepts of the understanding are those under which all perceptions must be subsumed ere they can serve for judgments of experience, in which the synthetical unity of the perceptions is represented as necessary and universally valid.12

Sect. 23. judgments, when considered merely as the condition of the union of given representations in a consciousness, are rules. These rules, so far as they represent the union as necessary, are rules a priori, and so far as they cannot be deduced from higher rules, are fundamental principles. But in regard to the possibility of all experience, merely in relation to the form of thinking in it, no conditions of judgments of experience are higher than those which bring the phenomena, according to the various form of their intuition, under pure concepts of the understanding, and render the empirical judgment

objectively valid. These concepts are therefore the a priori principles of possible experience.

The principles of possible experience are then at the same time universal laws of nature, which can be known a priori. And thus the problem in our second question, "How is the pure Science of Nature possible?" is solved. For the system which is required for the form of a science is to be met with in perfection here, because, beyond the above-mentioned formal conditions of all judgments in general offered in logic, no others are possible, and these constitute a logical system. The concepts grounded thereupon, which contain the a priori conditions of all synthetical and necessary judgments, accordingly constitute a transcendental system. Finally the principles, by means of which all phenomena are subsumed under these concepts, constitute a physical13 system, that is, a system of nature, which precedes all empirical cognition of nature, makes it even possible, and hence may in strictness be denominated the universal and pure science of nature.

Sect. 24. The first one14 of the physiological principles subsumes all phenomena, as intuitions in space and time, under the concept of Quantity, and is so far a principle of the application of Mathematics to experience. The second one subsumes the empirical element, viz., sensation, which denotes the real in intuitions, not indeed directly under the concept of quantity, because sensation is not an intuition that contains either space or time, though it places the respective object into both. But still there is between reality (sense-representation) and the zero, or total void of intuition in time, a difference which has a quantity. For between every given degree of light and of darkness, between every degree of beat and of absolute cold, between every degree of weight and of absolute lightness, between every degree of occupied space and of totally void space, diminishing degrees can be conceived, in the same manner as between consciousness and total unconsciousness (the darkness of a psychological blank) ever diminishing degrees obtain. Hence there is no perception that can prove an absolute absence of it; for instance, no psychological darkness that cannot be considered as a kind of consciousness, which is only out-balanced by a stronger consciousness. This occurs in all cases of sensation, and so the understanding can anticipate even sensations, which constitute the peculiar quality of empirical representations (appearances), by means of the principle: "that they all have (consequently that what is real in all phenomena has) a degree." Here is the second application of mathematics (mathesis intensortim) to the science of nature.

Sect. 25. Anent the relation of appearances merely with a view to their existence, the determination is not mathematical but dynamical, and can never be objectively valid, consequently never fit for experience, if it does not come under a priori principles by which the cognition of experience relative to appearances becomes even possible. Hence appearances must be subsumed under the concept of Substance, which is the foundation of all determination of existence, as a concept of the thing itself; or secondly so far as a succession is found among phenomena, that is, an event-under the concept of an Effect with reference to Cause; or lastly-so far as coexistence is to be known objectively, that is, by a judgment of experience-under the concept of Community (action and reaction).15 Thus a priori

principles form the basis of objectively valid, though empirical judgments, that is, of the possibility of experience so far as it must connect objects as existing in nature. These principles are the proper laws of nature, which may be termed dynamical.

Finally the cognition of the agreement and connection not only of appearances among themselves in experience, but of their relation to experience in general, belongs to the judgments of experience. This relation contains either their agreement with the formal conditions, which the understanding knows, or their coherence with the materials of the senses and of perception, or combines both into one concept. Consequently it contains Possibility, Actuality, and Necessity according to universal laws of nature; and this constitutes the physical doctrine of method, or the distinction of truth and of hypotheses, and the bounds of the certainty of the latter.

Sect. 26. The third table of Principles drawn from the nature of the understanding itself after the critical method, shows an inherent perfection, which raises it far above every other table which has hitherto though in vain been tried or may yet be tried by analyzing the objects themselves dogmatically. It exhibits all synthetical a priori principles completely and according to one principle, viz., the faculty of judging in general, constituting the essence of experience as regards the understanding, so that we can be certain that there are no more such principles, which affords a satisfaction such as can never be attained by the dogmatical method. Yet is this not all: there is a still greater merit in it.

We must carefully bear in mind the proof which shows the possibility of this cognition a priori, and at the same time limits all such principles to a condition which must never be lost sight of, if we desire it not to be misunderstood, and extended in use beyond the original sense which the understanding attaches to it. This limit is that they contain nothing but the conditions of possible experience in general so far as it is Subjected to laws a priori. Consequently I do not say, that things in themselves possess a quantity, that their actuality possesses a degree, their existence a connection of accidents in a substance, etc. This nobody can prove, because such a synthetical connection from mere concepts, without any reference to sensuous intuition on the one side, or connection of it in a possible experience on the other, is absolutely impossible. The essential limitation of the concepts in these principles then is: That all things stand necessarily a priori under the aforementioned conditions, as objects of experience only.

Hence there follows secondly a specifically peculiar mode of proof of these principles: they are not directly referred to appearances and to their relations, but to the possibility of experience, of which appearances constitute the matter only, not the form. Thus they are referred to objectively and universally valid synthetical propositions, in which we distinguish judgments of experience from those of perception. This takes place because appearances, as mere intuitions, occupying a part of space and time, come under the concept of Quantity, which unites their multiplicity a priori according to rules synthetically. Again, so far as the perception contains, besides intuition, sensibility, and between the latter and nothing (i.e., the total disappearance of sensibility), there is an ever-decreasing transition, it is

apparent that that which is in appearances must have a degree, so far as it (viz., the perception) does not itself occupy any part of space or of time.16 Still the transition to actuality from empty time or empty space is only possible in time; consequently though sensibility, as the quality of empirical intuition, can never be known a priori, by its specific difference from other sensibilities, yet it can, in a possible experience in general, as a quantity of perception be intensely distinguished from every other similar perception. Hence the application of mathematics to nature, as regards the sensuous intuition by which nature is given to us, becomes possible and is thus determined.

Above all, the reader must pay attention to the mode of proof of the principles which occur under the title of Analogies of experience. For these do not refer to the genesis of intuitions, as do the principles of applied mathematics, but to the connection of their existence in experience; and this can be nothing but the determination of their existence in time according to necessary laws, under which alone the connection is objectively valid, and thus becomes experience. The proof therefore does not turn on the synthetical unity in the connection of things in themselves, but merely of perceptions, and of these not in regard to their matter, but to the determination of time and of the relation of their existence in it, according to universal laws. If the empirical determination in relative time is indeed objectively valid (i.e., experience), these universal laws contain the necessary determination of existence in time generally (viz., according to a rule of the understanding a priori).

In these Prolegomena I cannot further descant on the subject, but my reader (who has probably been long accustomed to consider experience a mere empirical synthesis of perceptions, and hence not considered that it goes much beyond them, as it imparts to empirical judgments universal validity, and for that purpose requires a pure and a priori unity of the understanding) is recommended to pay special attention to this distinction of experience from a mere aggregate of perceptions, and to judge the mode of proof from this point of view.

Sect. 27. Now we are prepared to remove Hume's doubt. He justly maintains, that we cannot comprehend by reason the possibility of Causality, that is, of the reference of the existence of one thing to the existence of another, which is necessitated by the former. I add, that we comprehend just as little the concept of Subsistence, that is, the necessity that at the foundation of the existence of things there lies a subject which cannot itself be a predicate of any other thing; nay, we cannot even form a notion of the possibility of such a thing (though we can point out examples of its use in experience). The very same incomprehensibility affects the Community of things, as we cannot comprehend bow from the state of one thing an inference to the state of quite another thing beyond it, and vice versa, can be drawn, and how substances which have each their own separate existence should depend upon one another necessarily. But I am very far from holding these concepts to be derived merely from experience, and the necessity represented in them, to be imaginary and a mere illusion produced in us by long habit. On the contrary, I have amply shown, that they and the theorems derived from them are firmly established a priori, or before all experience, and have their undoubted objective value, though only

with regard to experience.

Sect. 28. Though I have no notion of such a connection of things in themselves, that they can either exist as substances, or act as causes, or stand in community with others (as parts of a real whole), and I can just as little conceive such properties in appearances as such (because those concepts contain nothing that lies in the appearances, but only what the understanding alone must think): we have yet a notion of such a connection of representations in our understanding, and in judgments generally; consisting in this that representations appear in one sort of judgments as subject in relation to predicates, in another as reason in relation to consequences, and in a third as parts, which constitute together a total possible cognition. Besides we know a priori that without considering the representation of an object as determined in some of these respects, we can have no valid cognition of the object, and, if we should occupy ourselves about the object in itself, there is no possible attribute, by which I could know that it is determined under any of these aspects, that is, under the concept either of substance, or of cause, or (in relation to other substances) of community, for I have no notion of the possibility of such a connection of existence. But the question is not how things in themselves, but how the empirical cognition of things is determined as regards the above aspects of judgments in general, that is, how things, as objects of experience, can and shall be subsumed under these concepts of the understanding. And then it is clear, that I completely comprehend not only the possibility, but also the necessity of subsuming all phenomena under these concepts, that is, of using them for principles of the possibility of experience.

Sect. 29. When making an experiment with Hume's problematical concept (his crux metaphysicorum), the concept of cause, we have, in the first place, given a priori, by means of logic, the form of a conditional judgment in general, i.e., we have one given cognition as antecedent and another as consequence. But it is possible, that in perception we may meet with a rule of relation, which runs thus: that a certain phenomenon is constantly followed by another (though not conversely), and this is a case for me to use the hypothetical judgment, and, for instance, to say, if the sun shines long enough upon a body, it grows warm. Here there is indeed as yet no necessity of connection, or concept of cause. But I proceed and say, that if this proposition, which is merely a subjective connection of perceptions, is to be a judgment of experience, it must be considered as necessary and universally valid. Such a proposition would be, II the sun is by its light the cause of heat." The empirical rule is now considered as a law, and as valid not merely of appearances but valid of them for the purposes of a possible experience which requires universal and therefore necessarily valid rules. I therefore easily comprehend the concept of cause, as a concept necessarily belonging to the mere form of experience, and its possibility as a synthetical union of perceptions in consciousness generally; but I do not at all comprehend the possibility of a thing generally as a cause, because the concept of cause denotes a condition not at all belonging to things, but to experience. It is nothing in fact but an objectively valid cognition of appearances and of their succession, so far as the antecedent can be conjoined with the consequent according to the rule of hypothetical judgments.

Sect. 30. Hence if the pure concepts of the understanding do not refer to objects of experience but to things in themselves (noumena), they have no signification whatever. They serve, as it were, only to decipher appearances, that we may be able to read them as experience. The principles which arise from their reference to the sensible world, only serve our understanding for empirical use. Beyond this they are arbitrary combinations, without objective reality, and we can neither know their possibility a priori, nor verify their reference to objects, let alone make it intelligible by any example; because examples can only be borrowed from some possible experience, consequently the objects of these concepts can be found nowhere but in a possible experience.

This complete (though to its originator unexpected) solution of Hume's problem rescues for the pure concepts of the understanding their a priori origin, and for the universal laws of nature their validity, as laws of the understanding, yet in such a way as to limit their use to experience, because their possibility depends solely on the reference of the understanding to experience, but with a completely reversed mode of connection which never occurred to Hume, not by deriving them from experience, but by deriving experience from them.

This is therefore the result of all our foregoing inquiries: "All synthetical principles a priori are nothing more than principles of possible experience, and can never be referred to things in themselves, but to appearances as objects of experience. And hence pure mathematics as well as a pure science of nature can never be referred to anything more than mere appearances, and can only represent either that which makes experience generally possible, or else that which, as it is derived from these principles, must always be capable of being represented in some possible experience."

Sect. 31. And thus we have at last something definite, upon which to depend in all metaphysical enterprises, which have hitherto, boldly enough but always at random, attempted everything without discrimination. That the aim of their exertions should be so near, struck neither the dogmatical thinkers nor those who, confident in their supposed sound common sense, started with concepts and principles of pure reason (which were legitimate and natural, but destined for mere empirical use) in quest of fields of knowledge, to which they neither knew nor could know any determinate bounds, because they bad never reflected nor were able to reflect on the nature or even on the possibility of such a pure understanding.

Many a naturalist of pure reason (by which I mean the man who believes he can decide in matters of metaphysics without any science) may pretend, that lie long ago by the prophetic spirit of his sound sense, not only suspected, but knew and comprehended, what is here propounded with so much ado, or, if he likes, with prolix and pedantic pomp: "that with all our reason we can never reach beyond the field of experience." But when he is questioned about his rational principles individually, he must grant, that there are many of them which be has not taken from experience, and which are therefore independent of it and valid a priori. How then and on what grounds will he restrain both himself and the dogmatist, who makes use of these concepts and

principles beyond all possible experience, because they are recognized to be independent of it? And even he, this adept in sound sense, in spite of all his assumed and cheaply acquired wisdom, is not exempt from wandering inadvertently beyond objects of experience into the field of chimeras. He is often deeply enough involved in them, though in announcing everything as mere probability, rational conjecture, or analogy, be gives by his popular language a color to his groundless pretensions.

Sect. 32. Since the oldest days of philosophy inquirers into pure reason have conceived, besides the things of sense, or appearances (phenomena), which make up the sensible world, certain creations of the understanding (Verstandeswesen), called noumena, which should constitute an intelligible world. And as appearance and illusion were by those men identified (a thing which we may well excuse in an undeveloped epoch), actuality was only conceded to the creations of thought.

And we indeed, rightly considering objects of sense as mere appearances, confess thereby that they are based upon a thing in itself, though we know not this thing in its internal constitution, but only know its appearances, viz., the way in which our senses are affected by this unknown something. The understanding therefore, by assuming appearances, grants the existence of things in themselves also, and so far we may say, that the representation of such things as form the basis of phenomena, consequently of mere creations of the understanding, is not only admissible, but unavoidable.

Our critical deduction by no means excludes things of that sort (noumena), but rather limits the principles of the Aesthetic (the science of the sensibility) to this, that they shall not extend to all things, as everything would then be turned into mere appearance, but that they shall only hold good of objects of possible experience. Hereby then objects of the understanding are granted, but with the inculcation of this rule which admits of no exception: "that we neither know nor can know anything at all definite of these pure objects of the understanding, because our pure concepts of the understanding as well as our pure intuitions extend to nothing but objects of possible experience, consequently to mere things of sense, and as soon as we leave this sphere these concepts retain no meaning whatever."

Sect. 33. There is indeed something seductive in our pure concepts of the understanding, which tempts us to a transcendent use, -- a use which transcends all possible experience. Not only are our concepts of substance, of power, of action, of reality, and others, quite independent of experience, containing nothing of sense appearance, and so apparently applicable to things in themselves (noumena), but, what strengthens this conjecture, they contain a necessity of determination in themselves, which experience never attains. The concept of cause implies a rule, according to which one state follows another necessarily; but experience can only show us, that one state of things often, or at most, commonly, follows another, an(i therefore affords neither strict universality, nor necessity.

Hence the Categories seem to have a deeper meaning and import than can be exhausted by their empirical use, and so the understanding inadvertently adds for itself to the house of experience a much more extensive wing, which it fills with

nothing but creatures of thought, without ever observing that it has transgressed with its otherwise lawful concepts the bounds of their use.

Sect. 34. Two important, and even indispensable, though very dry, investigations had therefore become indispensable in the Critique of Pure Reason,-viz., the two chapters "Vom Schematismus der reinen Verstandsbegriffe," and "Vom Grunde der Unterscheidung aller Verstandesbegriffe uberhaupt in Phenomena und Noumena. " In the former it is shown, that the senses furnish not the pure concepts of the understanding in concreto, but only the schedule for their use, and that the object conformable to it occurs only in experience (as the product of the understanding from materials of the sensibility). In the latter it is shown, that, although our pure concepts of the understanding and our principles are independent of experience, and despite of the apparently greater sphere of their use, still nothing whatever can be thought by them beyond the field of experience, because they can do nothing but merely determine the logical form of the judgment relatively to given intuitions. But as there is no intuition at all beyond the field of the sensibility, these pure concepts, as they cannot possibly be exhibited in concrete, are void of all meaning; consequently all these noumena, together with their complex, the intelligible world,17 are nothing but representation of a problem, of which the object in itself is possible, but the solution, from the nature of our understanding, totally impossible. For our understanding is not a faculty of intuition, but of the connection of given intuitions in experience. Experience must therefore contain all the objects for our concepts; but beyond it no concepts have any significance, as there is no intuition that might offer them a foundation.

Sect. 35. The imagination may perhaps be forgiven for occasional vagaries, and for not keeping carefully within the limits of experience, since it gains life and vigor by such flights, and since it is always easier to moderate its boldness, than to stimulate its languor. But the understanding which ought to think can never be forgiven for indulging in vagaries; for we depend upon it alone for assistance to set bounds, when necessary, to the vagaries of the imagination.

But the understanding begins its aberrations very innocently and modestly. It first elucidates the elementary cognitions, which inhere in it prior to all experience, but yet must always have their application in experience. It gradually drops these limits, and what is there to prevent it, as it has quite freely derived its principles from itself? And then it proceeds first to newly-imagined powers in nature, then to beings outside nature; in short to a world, for whose construction the materials cannot be wanting, because fertile fiction furnishes them abundantly, and though not confirmed, is never refuted, by experience. This is the reason that young thinkers arc so partial to nietaph3,sics of the truly dogmatical kind, and often sacrifice to it their time and their talents, which might be otherwise better employed.

But there is no use in trying to moderate these fruitless endeavors of pure reason by all manner of cautions as to the difficulties of solving questions so occult, by complaints of the limits of our reason, and by degrading our assertions into mere conjectures. For if their impossibility is not distinctly shown, and reason's cognition of its own essence does not become a true

science, in which the field of its right use is distinguished, so to say, with mathematical certainty from that of its worthless and idle use, these fruitless efforts will never be abandoned for good.

Sect. 36. How is Nature itself possible?

This question -- the highest point that transcendental philosophy can ever reach, and to which, as its boundary and completion, it must proceed-properly contains two questions.

First: How is nature at all possible in the material sense, by intuition, considered as the totality of appearances; how are space, time, and that which fills both -- the object of sensation, in general possible? The answer is: By means of the constitution of our Sensibility, according to which it is specifically affected by objects, which are in themselves unknown to it, and totally distinct from those phenomena. This answer is given in the Critique itself in the transcendental Aesthetic, and in these Prolegomena by the solution of the first general problem.

Secondly: How is nature possible in the formal sense, as the totality of the rules, under which all phenomena must come, in order to be thought as connected in experience? The answer must be this: it is only possible by means of the constitution of our Understanding, according to which all the above representations of the sensibility are necessarily referred to a consciousness, and by which the peculiar way in which we think (viz., by rules), and hence experience also, are possible, but must be clearly distinguished from an insight into the objects in themselves. This answer is given in the Critique itself in the transcendental Logic, and in these Prolegomena, in the course of the solution of the second main problem.

But how this peculiar property of our sensibility itself is possible, or that of our understanding and of the apperception which is necessarily its basis and that of all thinking, cannot be further analyzed or answered, because it is of them that we are in need for all our answers and for all our thinking about objects.

There are many laws of nature, which we can only know by means of experience; but conformity to law in the connection of appearances, i.e., in nature in general, we cannot discover by any experience, because experience itself requires laws which are a priori at the basis of its possibility.

The possibility of experience in general is therefore at the same time the universal law of nature, and the principles of the experience are the very laws of nature. For we do not know nature but as the totality of appearances, i.e., of representations in us, and hence we can only derive the laws of its connection from the principles of their connection in us, that is, from the conditions of their necessary union in consciousness, which constitutes the possibility of experience.

Even the main proposition expounded throughout this section -- that universal laws of nature can be distinctly known a priori -- leads naturally to the proposition: that the highest legislation of nature must lie in ourselves, i.e., in our

understanding, and that we must not seek the universal laws of nature in nature by means of experience, but conversely must seek nature, as to its universal conformity to law, in the conditions of the possibility of experience, which lie in our sensibility and in our understanding. For bow were it otherwise possible to know a priori these laws, as they are not rules of analytical cognition, but truly synthetical extensions of it?

Such a necessary agreement of the principles of possible experience with the laws of the possibility of nature, can only proceed from one of two reasons: either these laws are drawn from nature by means of experience, or conversely nature is derived from the laws of the possibility of experience in general, and is quite the same as the mere universal conformity to law of the latter. The former is self-contradictory, for the universal laws of nature can and must be known a priori (that is, independent of all experience), and be the foundation of all empirical use of the understanding; the latter alternative therefore alone remains.18

But we must distinguish the empirical laws of nature, which always presuppose particular perceptions, from the pure or universal laws of nature, which, without being based on particular perceptions, contain merely the conditions of their necessary union in experience. In relation to the latter, nature and possible experience are quite the same, and as the conformity to law here depends upon the -necessary connection of appearances in experience (without which we cannot know any object whatever in the sensible world), consequently upon the original laws of the understanding, it seems at first strange, but is not the less certain, to say: The understanding does not derive its laws (a priori) from, but prescribes them to, nature.

Sect. 37. We shall illustrate this seemingly bold proposition by an example, which will show, that laws, which we discover in objects of sensuous intuition (especially when these laws are known as necessary), are commonly held by us to be such as have been placed there by the understanding, in spite of their being similar in all points to the laws of nature, which we ascribe to experience.

Sect. 38. If we consider the properties of the circle, by which this figure combines so many arbitrary determinations of space in itself, at once in a universal rule, we cannot avoid attributing a constitution (eine Natur) to this geometrical thing. Two right lines, for example, which intersect one another and the circle, howsoever they may be drawn, are always divided so that the rectangle constructed with the segments of the one is equal to that constructed with the segments of the other. The question now is: Does this law lie in the circle or in the understanding, that is, Does this figure, independently of the understanding, contain in itself the ground of the law, or does the understanding, having constructed according to its concepts (according to the quality of the radii) the figure itself, introduce into it this law of the chords cutting one another in geometrical proportion? When we follow the proofs of this law, we soon perceive, that it can only be derived from the condition on which the understanding founds the construction of this figure, and which is that of the equality of the radii. But, if we enlarge this concept, to pursue further the unity of various properties of geometrical figures under common laws, and consider

the circle as a conic section, which of course is subject to the same fundamental conditions of construction as other conic sections, we shall find that all the chords which intersect within the ellipse, parabola, and hyperbola, always intersect so that the rectangles of their segments are not indeed equal, but always bear a constant ratio to one another. If we proceed still farther, to the fundamental laws of physical astronomy, we find a physical law of reciprocal attraction diffused over all material nature, the rule of which is: II that it decreases inversely as the square of the distance from each attracting point, i.e., as the spherical surfaces increase, over which this force spreads," which law seems to be necessarily inherent in the very nature of things, and hence is usually propounded as knowable a priori. Simple as the sources of this law are, merely resting upon the relation of spherical surfaces of different radii, its consequences are so valuable with regard to the variety of their agreement and its regularity, that not only are all possible orbits of the celestial bodies conic sections, but such a relation of these orbits to each other results, that no other law of attraction, than that of the inverse square of the distance, can be imagined as fit for a cosmical system.

Here accordingly is a nature that rests upon laws which the understanding knows a priori, and chiefly from the universal principles of the determination of space. Now I ask: Do the laws of nature lie in space, and does the understanding learn them by merely endeavoring to find out the enormous wealth of meaning that lies in space; or do they inhere in the understanding and in the way in which it determines space according to the conditions of the synthetical unity in which its concepts are all centered?

Space is something so uniform and as to all particular properties so indeterminate, that we should certainly not seek a store of laws of nature in it. Whereas that which determines space to assume the form of a circle or the figures of a cone and a sphere, is the understanding, so far as it contains the ground of the unity of their constructions.

The mere universal form of intuition, called space, must therefore be the substratum of all intuitions determinable to particular objects, and in it of course the condition of the possibility and of the variety of these intuitions lies. But the unity of the objects is entirely determined by the understanding, and on conditions which lie in its own nature; and thus the understanding is the origin of the universal order of nature, in that it comprehends all appearances under its own laws, and thereby first constructs, a priori, experience (as to its form), by means of which whatever is to be known only by experience, is necessarily subjected to its laws. For we are not now concerned with the nature of things in themselves, which is independent of the conditions both of our sensibility and our understanding, but with nature, as an object of possible experience, and in this case the understanding, whilst it makes experience possible, thereby insists that the sensuous world is either not an object of experience at all, or must be nature [viz., an existence of things, determined according to universal laws19].

APPENDIX TO THE PURE SCIENCE OF NATURE.

Sect. 39. Of the System of the Categories.

There can be nothing more desirable to a philosopher, than to be able to derive the scattered multiplicity of the concepts or the principles, which had occurred to him in concrete use, from a principle a priori, and to unite everything in this way in one cognition. He formerly only believed that those things, which remained after a certain abstraction, and seemed by comparison among one another to constitute a particular kind of cognitions, were completely collected; but this was only an Aggregate. Now he knows, that just so many, neither more nor less, can constitute the mode of cognition, and perceives the necessity of his division, which constitutes comprehension; and now only he has attained a System.

To search in our daily cognition for the concepts, which do not rest upon particular experience, and yet occur in all cognition of experience, where they as it were constitute the mere form of connection, presupposes neither greater reflection nor deeper insight, than to detect in a language the rules of the actual use of words generally, and thus to collect elements for a grammar. In fact both researches are very nearly related, even though we are not able to give a reason why each language has just this and no other formal constitution, and still less why an exact number of such formal determinations in general are found in it.

Aristotle collected ten pure elementary concepts under the name of Categories.20 To these, which are also called predicaments,21 he found himself obliged afterwards to add five post-predicaments, some of which however (prius, simul, and molus) are contained in the former; but this random collection must be considered (and commended) as a mere hint for future inquirers, not as a regularly developed idea, and hence it has, in the present more advanced state of philosophy, been rejected as quite useless.

After long reflection on the pure elements of human knowledge (those which contain nothing empirical), I at last succeeded in distinguishing with certainty and in separating the pure elementary notions of the Sensibility (space and time) from those of the Understanding. Thus the 7th, 8th, and 8th Categories had to be excluded from the old list. And the others were of no service to me; because there was no principle [in them], on which the understanding could be investigated, measured in its completion, and all the functions, whence its pure concepts arise, determined exhaustively and with precision.

But in order to discover such a principle, I looked about for an act of the understanding which comprises all the rest, and is distinguished only by various modifications or phases, in reducing the multiplicity of representation to the unity of thinking in general: I found this act of the understanding to consist in judging. Here then the labors of the logicians were ready at hand, though not yet quite free from defects, and with this help I was enabled to exhibit a complete table of the pure functions of the understanding, which are however undetermined in regard to any object. I finally referred these functions of judging to objects in general, or rather to the condition of determining judgments as objectively valid, and so there arose the pure concepts of the understanding, concerning which I could make certain, that these, and this exact number only, constitute our whole cognition of things from pure understanding. I was

justified in calling them by their old name, Categories, while I reserved for myself the liberty of adding, under the title of "Predicables," a complete list of all the concepts deducible from them, by combinations whether among themselves, or with the pure form of the appearance, i.e., space or time, or with its matter, so far as it is not yet empirically determined (viz., the object of sensation in general), as soon as a system of transcendental philosophy should be completed with the construction of which I am engaged in the Critique of Pure Reason itself.

Now the essential point in this system of Categories, which distinguishes it from the old rhapsodical collection without any principle, and for which alone it deserves to be considered as philosophy, consists in this: that by means of it the true significance of the pure concepts of the understanding and the condition of their use could be precisely determined. For here it became obvious that they are themselves nothing but logical functions, and as such do not produce the least concept of an object, but require some sensuous intuition as a basis. They therefore only serve to determine empirical judgments, which are otherwise undetermined and indifferent as regards all functions of judging, relatively to these functions, thereby procuring them universal validity, and by means of them making judgments of experience in general possible.

Such an insight into the nature of the categories, which limits them at the same time to the mere use of experience, never occurred either to their first author, or to any of his successors; but without this insight (which immediately depends upon their derivation or deduction), they are quite useless and only a miserable list of names, without explanation or rule for their use. Had the ancients ever conceived such a notion, doubtless the whole study of the pure rational knowledge, which under the name of metaphysics has for centuries spoiled many a sound mind, would have reached us. in quite another shape, and would have enlightened the human understanding, instead of actually exhausting it in obscure and vain speculations, thereby rendering it unfit for true science.

This system of categories makes all treatment of every object of pure reason itself systematic, and affords a direction or clue how and through what points of inquiry every metaphysical consideration must proceed, in order to be complete; for it exhausts all the possible movements (momenta) of the understanding, among which every concept must be classed. In like manner the table of Principles has been formulated, the completeness of which we can only vouch for by the system of the categories. Even in the division of the concepts,22 which must go beyond the physical application of the understanding, it is always the very same clue, which, as it must always be determined a priori by the same fixed points of the human understanding, always forms a closed circle. There is no doubt that the object of a pure conception either of the understanding or of reason, so far as it is to be estimated philosophically and on a priori principles, can in this way be completely known. I could not therefore omit to make use of this clue with regard to one of the most abstract ontological divisions, viz., the various distinctions of "the notions of something and of nothing," and to construct accordingly (Critique, P. 207) a regular and necessary table of their divisions.23

And this system, like every other true one founded on a universal principle, shows its inestimable value in this, that it excludes all foreign concepts, which might otherwise intrude among the pure concepts of the understanding, and determines the place of every cognition. Those concepts, which under the name of "concepts of reflection" have been likewise arranged in a table according to the clue of the categories, intrude, without having any privilege or title to be among the pure concepts of the understanding in Ontology. They are concepts of connection, and thereby of the objects themselves, whereas the former are only concepts of a mere comparison of concepts already given, hence of quite another nature and use. By my systematic division24 they are saved from this confusion. But the value of my special table of the categories will be still more obvious, when we separate the table of the transcendental concepts of Reason from the concepts of the understanding. The latter being of quite another nature and origin, they must have quite another form than the former. This so necessary separation has never yet been made in any system of metaphysics for, as a rule, these rational concepts all mixed up with the categories, like children of one family, which confusion was unavoidable in the absence of a definite system of categories.

THIRD PART OF THE MAIN TRANSCENDENTAL PROBLEM. HOW IS METAPHYSICS IN GENERAL POSSIBLE?

Sect. 40. Pure mathematics and pure science of nature had no occasion for such a deduction, as we have made of both, for their own safety and certainty. For the former rests upon its own evidence; and the latter (though sprung from pure sources of the understanding) upon experience and its thorough confirmation. Physics cannot altogether refuse and dispense with the testimony of the latter; because with all its certainty, it can never, as philosophy, rival mathematics. Both sciences therefore stood in need of this inquiry, not for themselves, but for the sake of another science, metaphysics.

Metaphysics has to do not only with concepts of nature, which always find their application in experience, but also with pure rational concepts, which never can be given in any possible experience. Consequently the objective reality of these concepts (viz., that they are not mere chimeras), and the truth or falsity of metaphysical assertions, cannot be discovered or confirmed by any experience. This part of metaphysics however is precisely what constitutes its essential end, to which the rest is only a means, and thus this science is in need of such a deduction for its, own sake. The third question now proposed relates therefore as it were to the root and essential difference of metaphysics, i.e., the occupation of Reason with itself, and the supposed knowledge of objects arising immediately from this incubation of its own concepts, without requiring, or indeed being able to reach that knowledge through, experience.25

Without solving this problem reason never is justified. The empirical use to which reason limits the pure understanding, does not fully satisfy the proper destination of the latter. Every single experience is only a part of the whole sphere of its domain, but the absolute totality of all possible experience is itself not experience. Yet it is a necessary [concrete] problem for reason, the mere representation of which requires concepts quite different from the categories, whose use is only immanent,

or refers to experience, so far as it can be given. Whereas the concepts of reason aim at the completeness, i.e., the collective unity of all possible experience, and thereby transcend every given experience. Thus they become transcendent.

As the understanding stands in need of categories for experience, reason contains in itself the source of ideas, by which I mean necessary concepts, whose object cannot be given in any experience. The latter are inherent in the nature of reason, as the former are in that of the understanding. While the former carry with them an illusion likely to mislead, the illusion of the latter is inevitable, though it certainly can be kept from misleading us.

Since all illusion consists in holding the subjective ground of our judgments to be objective, a self-knowledge of pure reason in its transcendent (exaggerated) use is the sole preservative from the aberrations into which reason falls when it mistakes its destination, and refers that to the object transcendently, which only regards its own subject and its guidance in all immanent use.

Sect. 41. The distinction of ideas, that is, of pure concepts of reason, from categories, or pure concepts of the understanding, as cognitions of a quite distinct species, origin and use, is so important a point in founding a science which is to contain the system of all these a priori cognitions, that without this distinction metaphysics is absolutely impossible, or is at best a random, bungling attempt to build a castle in the air without a knowledge of the materials or of their fitness for any purpose. Had the Critique of Pure Reason done nothing but first point out this distinction, it had thereby contributed more to clear up our conception of, and to guide our inquiry in, the field of metaphysics, than all the vain efforts which have hitherto been made to satisfy the transcendent problems of pure reason, without ever surmising that we were in quite another field than that of the understanding, and hence classing concepts of the understanding and those of reason together, as if they were of the same kind.

Sect. 42. All pure cognitions of the understanding have this feature, that their concepts present themselves in experience, and their principles can be confirmed by it; whereas the transcendent cognitions of reason cannot, either as ideas, appear in experience, -or as propositions ever be confirmed or refuted by it. Hence whatever errors may slip in unawares, can only be discovered by pure reason itself-a discovery of much difficulty, because this very reason naturally becomes dialectical by means of its ideas, and this unavoidable illusion cannot be limited by any objective and dogmatical researches into things, but by a subjective investigation of reason itself as a source of ideas.

Sect. 43. In the Critique of Pure Reason it was always my greatest care to endeavor not only carefully to distinguish the several species of cognition, but to derive concepts belonging to each one of them from their common source. I did this in order that by knowing whence they originated, I might determine their use with safety, and also have the unanticipated but invaluable advantage of knowing the completeness of my enumeration, classification and specification of concepts a priori, and therefore according to principles. Without this, metaphysics is

mere rhapsody, in which no one knows whether he has enough, or whether and where something is still wanting. We can indeed have this advantage only in pure philosophy, but of this philosophy it constitutes the very essence.

As I had found the origin of the categories in the four logical functions of all the judgments of the understanding, it was quite natural to seek the origin of the ideas in the three functions of the syllogisms of reason. For as soon as these pure concepts of reason (the transcendental ideas) are given, they could hardly, except they be held innate, be found anywhere else, than in the same activity of reason, which, so far as it regards mere form, constitutes the logical element of the syllogisms of reason; but, so far as it represents judgments of the understanding with respect to the one or to the other form a priori, constitutes transcendental concepts of pure reason.

The formal distinction of syllogisms renders their division into categorical, hypothetical, and disjunctive necessary. The concepts of reason founded on them contained therefore, first, the idea of the complete subject (the substantial); secondly, the idea of the complete series of conditions; thirdly, the determination of all concepts in the idea of a complete complex of that which is possible.26 The first idea is psychological, the second cosmological, the third theological, and, as all three give occasion to Dialectics, yet each in its own way, the division of the whole Dialects of pure reason into its Paralogism, its Antinomy, and its Ideal, was arranged accordingly. Through this deduction we may feel assured that all the claims of pure reason are completely represented, and that none can be wanting; because the faculty of reason itself, whence they all take their origin, is thereby completely surveyed.

Sect. 44. In these general considerations it is also remarkable that the ideas of reason are unlike the categories, of no service to the use of our understanding in experience, but quite dispensable, and become even an impediment to the maxims of a rational cognition of nature. Yet in another aspect still to be determined they are necessary. Whether the soul is or is not a simple substance, is of no consequence to us in the explanation of its phenomena. For we cannot render the notion of a simple being intelligible by any possible experience that is sensuous or concrete. The notion is therefore quite void as regards all hoped-for insight into the cause of phenomena, and cannot at all serve as a principle of the explanation of that which internal or external experience supplies. So the cosmological ideas of the beginning of the world or of its eternity (a parte ante) cannot be of any greater service to us for the explanation of any event in the world itself. And finally we must, according to a right maxim of the philosophy of nature, refrain from all explanations of the design of nature, drawn from the will of a Supreme Being; because this would not be natural philosophy, but an acknowledgment that we have come to the end of it. The use of these ideas, therefore, is quite different from that of those categories by which (and by the principles built upon which) experience itself first becomes possible. But our laborious analytics of the understanding would be superfluous if we had nothing else in view than the mere cognition Of nature as it can be given in experience; for reason does its work, both in mathematics and in the science of nature, quite safely and well without any of this subtle deduction. Therefore our Critique of

the Understanding combines with the ideas of pure reason for a purpose which lies beyond the empirical use of the understanding; but this we have above declared to be in this aspect totally inadmissible, and without any object or meaning. Yet there must be a harmony between that of the nature of reason and that of the understanding, and the former must contribute to the perfection of the latter, and cannot possibly upset it.

The solution of this question is as follows: Pure reason does not in its ideas point to particular objects, which lie beyond the field of experience, but only requires completeness of the use of the understanding in the system of experience. But this completeness can be a completeness of principles only, not of intuitions [i.e., concrete atsights or Anschauungen] and of objects. In order however to represent the ideas definitely, reason conceives them after the fashion of the cognition of an object. The cognition is as far as these rules are concerned completely determined, but the object is only an idea invented for the purpose of bringing the cognition of the understanding as near as possible to the completeness represented by that idea.

Prefatory Remark to the Dialectics of Pure Reason.

Sect. 45. We have above shown in Sect. Sect. 33 and 34 that the purity of the categories from all admixture of sensuous determinations may mislead reason into extending their use, quite beyond all experience, to things in themselves; though as these categories themselves find no intuition which can give them meaning or sense in concrete, they, as mere logical functions, can represent a thing in general, but not give by themselves alone a determinate concept of anything. Such hyperbolical objects are distinguished by the appellation of Noumena, or pure beings of the understanding (or better, beings of thought), such as, for example, "substance," but conceived without permanence in time, or "cause," but not acting in time, etc. Here predicates, that only serve to make the conformity-to-law of experience possible, are applied to these concepts, and yet they are deprived of all the conditions of intuition, on which alone experience is possible, and so these concepts lose all significance.

There is no danger, however, of the understanding spontaneously making an excursion so very wantonly beyond its own bounds into the field of the mere creatures of thought, without being impelled by foreign laws. But when reason, which cannot be fully satisfied with any empirical use of the rules of the understanding, as being always conditioned, requires a completion of this chain of conditions, then the understanding is forced out of its sphere. And then it partly represents objects of experience in a series so extended that no experience can grasp, partly even (with a view to complete the series) it seeks entirely beyond it noumena, to which it can attach that chain, and so, having at last escaped from the conditions of experience, make its attitude as it were final. These are then the transcendental ideas, which, though according to the true but hidden ends of the natural determination of our reason, they may aim not at extravagant concepts, but at an unbounded extension of their empirical use, yet seduce the understanding by an unavoidable illusion to a transcendent use, which, though deceitful, cannot be restrained within the bounds of experience by any resolution, but only by scientific instruction and with

much difficulty.

!. The Psychological Idea.27

Sect. 46. People have long since observed, that in all substances the proper subject, that which remains after all the accidents (as predicates) are abstracted, consequently that which forms the substance of things remains unknown, and various complaints have been made concerning these limits to our knowledge. But it will be well to consider that the human understanding is not to be blamed for its inability to know the substance of things, that is, to determine it by itself, but rather for requiring to know it which is a mere idea definitely as though it were a given object. Pure reason requires us to seek for every predicate of a thing its proper subject, and for this subject, which is itself necessarily nothing but a predicate, its subject, and so on indefinitely (or as far as we can reach). But hence it follows, that we must not hold anything, at which we can arrive, to be an ultimate subject, and that substance itself never can be thought by our understanding, however deep we may penetrate, even if all nature were unveiled to us. For the specific nature of our understanding consists in thinking everything discursively, that is, representing it by concepts, and so by mere predicates, to which therefore the absolute subject must always be wanting. Hence all the real properties, by which we know bodies, are mere accidents, not excepting impenetrability, which we can only represent to ourselves as the effect of a power of which the subject is unknown to us.

Now we appear to have this substance in the consciousness of ourselves (in the thinking subject), and indeed in an immediate intuition; for all the predicates of an internal sense refer to the ego, as a subject, and I cannot conceive myself as the predicate of any other subject. Hence completeness in the reference of the given concepts as predicates to a subject -- not merely an idea, but an object-that is, the absolute subject itself, seems to be given in experience. But this expectation is disappointed. For the ego is not a concept,28 but only the indication of the object of the internal sense, so far as we know it by no further predicate. Consequently it cannot be in itself a predicate of any other thing; but just as little can it be a determinate concept of an absolute subject, but is, as in all other cases, only the reference of the internal phenomena to their unknown subject. Yet this idea (which serves very well, as a regulative principle, totally to destroy all materialistic explanations of the internal phenomena of the soul) occasions by a very natural misunderstanding a very specious argument, which, from this supposed cognition of the substance of our thinking being, infers its nature, so far as the knowledge of it falls quite without the complex of experience.

Sect. 47. But though we may call this thinking self (the soul) substance, as being the ultimate subject of thinking which cannot be further represented as the predicate of another thing; it remains quite empty and without significance, if permanence-the quality which renders the concept of substances in experience fruitful-cannot be proved of it.

But permanence can never be proved of the concept of a substance, as a thing in itself, but for the purposes of experience only. This is sufficiently shown by the first Analogy

of Experience,29 and whoever will not yield to this proof may try for himself whether he can succeed in proving, from the concept of a subject which does not exist itself as the predicate of another thing, that its existence is thoroughly permanent, and that it cannot either in itself or by any natural cause original or be annihilated. These synthetical a priori propositions can never be proved in themselves, but only in reference to things as objects of possible experience.

Sect. 48. If therefore from the concept of the soul as a substance, we would infer its permanence, this can hold good as regards possible experience only, not [of the soul] as a thing in itself and beyond all possible experience. But life is the subjective condition of all our possible experience, consequently we can only infer the permanence of the soul in life; for the death of man is the end of all experience which concerns the soul as an object of experience, except the contrary be proved, which is the very question in hand. The permanence of the soul can therefore only be proved (and no one cares for that) during the life of man, but not, as we desire to do, after death; and for this general reason, that the concept of substance, so far as it is to be considered necessarily combined with the concept of permanence, can be so combined only according to the principles of possible experience, and therefore for the purposes of experience only.30

Sect. 49. That there is something real without us which not only corresponds, but must correspond, to our external perceptions, can likewise be proved to be not a connection of things in themselves, but for the sake of experience. This means that there is something empirical, i.e., some phenomenon in space without us, that admits of a satisfactory proof, for we have nothing to do with other objects than those which belong to possible experience; because objects which cannot be given us in any experience, do not exist for us. Empirically without me is that which appears in space, and space, together with all the phenomena which it contains, belongs to the representations, whose connection according to laws of experience proves their objective truth, just as the connection of the phenomena of the internal sense proves the actuality of my soul (as an object of the internal sense). By means of external experience I am conscious of the actuality of bodies, as external phenomena in space, in the same manner as by means of the internal experience I am conscious of the existence of my soul in time, but this soul is only known as an object of the internal sense by phenomena that constitute an internal state, and of which the essence in itself, which forms the basis of these phenomena, is unknown. Cartesian idealism therefore does nothing but distinguish external experience from dreaming; and the conformity to law (as a criterion of its truth) of the former, from the irregularity and the false illusion of the latter. In both it presupposes space and time as conditions of the existence of objects, and it only inquires whether the objects of the external senses, which we when awake put in space, are as actually to be found in it, as the object of the internal sense, the soul, is in time; that is, whether experience carries with it sure criteria to distinguish it from imagination. This doubt, however, may easily be disposed of, and we always do so in common life by investigating the connection of phenomena in both space and time according to universal laws of experience, and we cannot doubt, when the representation of external things throughout agrees therewith,

that they constitute truthful experience. Material idealism, in which phenomena are considered as such only according to their connection in experience, may accordingly be very easily refuted; and it is just as sure an experience, that bodies exist without us (in space), as that I myself exist according to the representation of the internal sense (in time): for the notion without us, only signifies existence in space. However as the Ego in the proposition, III am," means not only the object of internal intuition (in time), but the subject of consciousness, just as body means not only external intuition (in space), but the thing-in-itself, which is the basis of this phenomenon; [as this is the case] the question, whether bodies (as phenomena of the external sense) exist as bodies apart from my thoughts, may without any hesitation be denied in nature. But the question, whether I myself as a phenomenon of the internal sense (the soul according to empirical psychology) exist apart from my faculty of representation in time, is an exactly similar inquiry, and must likewise be answered in the negative. Arid in this manner everything, when it is reduced to its true meaning, is decided and certain. The formal (which I have also called transcendental) actually abolishes the material, or Cartesian, idealism. For if space be nothing but a form of my sensibility, it is as a representation in me just as actual as I myself am, and nothing but the empirical truth of the representations in it remains for consideration. But, if this is not the case, if space and the phenomena in it are something existing without us, then all the criteria of experience beyond our perception can never prove the actuality of these objects without us.

II. The Cosmological Idea.31

Sect. 50. This product of pure reason in its transcendent use is its most remarkable curiosity. It serves as a very powerful agent to rouse philosophy from its dogmatic slumber, and to stimulate it to the arduous task of undertaking a Critique of Reason itself.

I term this idea cosmological, because it always takes its object only from the sensible world, and does not use any other than those whose object is given to sense, consequently it remains in this respect in its native home, it does not become transcendent, and is therefore so far not mere idea; whereas, to conceive the soul as a simple substance, -already means to conceive such an object (the simple) as cannot be presented to the senses. Yet the cosmological idea extends the connection of the conditioned with its condition (whether the connection is mathematical or dynamical) so far, that experience never can keep up with it. It is therefore with regard to this point always an idea, whose object never can be adequately given in any experience.

Sect. 51. In the first place, the use of a system of categories becomes here so obvious and unmistakable, that even if there were not several other proofs of it, this alone would sufficiently prove it indispensable in the system of pure reason. There are only four such transcendent ideas, as there are so many classes of categories; in each of which, however, they refer only to the absolute completeness of the series of the conditions for a given conditioned. In analogy to these cosmological ideas there are only four kinds of dialectical assertions of pure reason, which, as they are dialectical, thereby prove, that to each of

them, oii equally specious principles of pure reason, a contradictory assertion stands opposed. As all the metaphysical art of the most subtle distinction cannot prevent this opposition, it compels the philosopher to recur to the first sources of pure reason itself. This Antinomy, not arbitrarily invented, but founded in the nature of human reason, and hence unavoidable and never ceasing, contains the following four theses together with their antitheses:

1.

Thesis: The World has, as to, Time and Space, a Beginning (limit).

Antithesis: The World is, as to Time and Space, infinite.

2.

Thesis: Everything in the World consists of [elements that are] simple.

Antithesis: There is nothing simple, but everything is composite.

3.

Thesis: There are in the World Causes through Freedom.

Antithesis: There is no Liberty, but all is Nature.

4.

Thesis: In the Series of the World-Causes there is some necessary Being.

Antithesis: There is Nothing necessary in the World, but in this Series All is incidental.

Sect. 52. a. Here is the most singular phenomenon of human reason, no other instance of which can be shown in any other use. If we, as is commonly done, represent to ourselves the appearances of the sensible world as things in themselves, if we assume the principles of their combination as principles universally valid of things in themselves and not merely of experience, as is usually, nay without our Critique, unavoidably done, there arises an unexpected conflict, which never can be removed in the common dogmatical way; because the thesis, as well as the antithesis, can be shown by equally clear, evident, and irresistible proofs-for I pledge myself as to the correctness of all these proofs-and reason therefore perceives that it is divided with itself, a state at which the skeptic rejoices, but which must make the critical philosopher pause and feel ill at ease.

Sect. 52. b. We may blunder in various ways in metaphysics without any fear of being detected in falsehood. For we never can be refuted by experience if we but avoid self-contradiction, which in synthetical, though purely fictitious propositions, may be done whenever the concepts, which we connect, are mere ideas, that cannot be given (in their whole content) in experience. For how can we make out by experience, whether the world is from eternity or had a beginning, whether matter is infinitely divisible or consists of simple parts? Such concept cannot be given in any experience, be it ever so extensive, and consequently the falsehood either of the positive or the negative proposition cannot be discovered by this touchstone.

The only possible way in which reason could have revealed unintentionally its secret Dialectics, falsely announced as Dogmatics, would be when it were made to ground an assertion upon a universally admitted principle, and to deduce the exact contrary with the greatest accuracy of inference from another

which is equally granted. This is actually here the case with regard to four natural ideas of reason, whence four assertions on the one side, and as many counter-assertions on the other arise, each consistently following from universally-acknowledged principles. Thus they reveal by the use of these principles the dialectical illusion of pure reason which would otherwise forever remain concealed.

This is therefore a decisive experiment, which must necessarily expose any error lying hidden in the assumptions of reason.32 Contradictory propositions cannot both be false, except the concept, which is the subject of both, is self-contradictory; for example, the propositions, "a square circle is round, and a square circle is not round," are both false. For, as to the former it is false, that the circle is round, because it is quadrangular; and it is likewise false, that it is not round, that is, angular, because it is a circle. For the logical criterion of the impossibility of a concept consists in this, that if we presuppose it, two contradictory propositions both become false; consequently, as no middle between them is conceivable, nothing at all is thought by that concept.

Sect. 52. c. The first two antinomies, which I call mathematical, because they are concerned with the addition or division of the homogeneous, are founded on such a self-contradictory concept; and hence I explain how it happens, that both the Thesis and Antithesis of the two are false.

When I speak of objects in time and in space, it is not of things in themselves, of which I know nothing, but of things in appearance, that is, of experience, as the particular way of cognising objects which is afforded to man. I must not say of what I think in time or in space, that in itself, and independent of these my thoughts, it exists in space and in time; for in that case I should contradict myself; because space and time, together with the appearances in them, are nothing existing in themselves and outside of my representations, but are themselves only modes of representation, and it is palpably contradictory to say, that a mere mode of representation exists without our representation. Objects of the senses therefore exist only in experience; whereas to give them a self-subsisting existence apart from experience or before it, is merely to represent to ourselves that experience actually exists apart from experience or before it.

Now if I inquire after the quantity of the world, as to space and time, it is equally impossible, as regards all my notions, to declare it infinite or to declare it finite. For neither assertion can be contained in experience, because experience either of an infinite space, or of an infinite time elapsed, or again, of the boundary of the world by a void space, or by an antecedent void time, is impossible; these are mere ideas. This quantity of the world, which is determined in either way, should therefore exist in the world itself apart from all experience. This contradicts the notion of a world of sense, which is merely a complex of the appearances whose existence and connection occur only in our representations, that is, in experience, since this latter is not an object in itself, but a mere mode of representation. Hence it follows, that as the concept of an absolutely existing world of sense is self-contradictory, the solution of the problem concerning its quantity, whether attempted affirmatively or negatively, is

always false.

The same holds good of the second antinomy, which relates to the division of phenomena. For these are mere representations, and the parts exist merely in their representation, consequently in the division, or in a possible experience where they are given, and the division reaches only as far as this latter reaches. To assume that an appearance, e.g., that of body, contains in itself before all experience all the parts, which any possible experience can ever reach, is to impute to a mere appearance, which can exist only in experience, an existence previous to experience. In other words, it would mean that mere representations exist before they can be found in our faculty of representation. Such an assertion is self-contradictory, as also every solution of our misunderstood problem, whether we maintain, that bodies in themselves consist of an infinite number of parts, or of a finite number of simple parts.

Sect. 53. In the first (the mathematical) class of antinomies the falsehood of the assumption consists in representing in one concept something self-contradictory as if it were compatible (i.e., an appearance as an object in itself). But, as to the second (the dynamical) class of antinomies, the falsehood of the representation consists in representing as contradictory what is compatible; so that, as in the former case, the opposed assertions are both false, in this case, on the other hand, where they are opposed to one another by mere misunderstanding, they may both be true.

Any mathematical connection necessarily presupposes homogeneity of what is connected (in the concept of magnitude), while the dynamical one by no means requires the same. When we have to deal with extended magnitudes, all the parts must be homogeneous with one another and with the whole; whereas, in the connection of cause and effect, homogeneity may indeed likewise be found, but is not necessary; for the concept of causality (by means of which something is posited through something else quite different from it), at all events, does not require it.

If the objects of the world of sense are taken for things in themselves, and the above laws of nature for the laws of things in themselves, the contradiction would be unavoidable. So also, if the subject of freedom were, like other objects, represented as mere appearance, the contradiction would be just as unavoidable, for the same predicate would at once be affirmed and denied of the same kind of object in the same sense. But if natural necessity is referred merely to appearances, and freedom merely to things in themselves, no contradiction arises, if we at once assume, or admit both kinds of causality, however difficult or impossible it may be to make the latter kind conceivable.

As appearance every effect is an event, or something that happens in time; it must, according to the universal law of nature, be preceded by a determination of the causality of its cause (a state), which follows according to a constant law. But this determination of the cause as causality must likewise be something that takes place or happens; the cause must have begun to act, otherwise no succession between it and the effect could be conceived. Otherwise the effect, as well as the causality of the cause, would have always existed. Therefore the determination of the cause to act must also have originated among appearances,

and must consequently, as well as its effect, be an event, which must again have its cause, and so on; hence natural necessity must be the condition, on which effective causes are determined. Whereas if freedom is to be a property of certain causes of appearances, it must, as regards these, which are events, be a faculty of starting them spontaneously, that is, without the causality of the cause itself, and hence without requiring any other ground to determine its start. But then the cause, as to its causality, must not rank under time-determinations of its state, that is, it cannot be an appearance, and must be considered a thing in itself, while its effects would be only appearances.33 If without contradiction we can think of the beings of understanding [Verstandeswesen] as exercising such an influence on appearances, then natural necessity will attach to all connections of cause and effect in the .sensuous world, though on the other hand, freedom can be granted to such cause, as is itself not an appearance (but the foundation of appearance). Nature therefore and freedom can without contradiction be attributed to the very same thing, but in different relations-on one side as a phenomenon, on the other as a thing in itself.

We have in us a faculty, which not only stands in connection with its subjective determining grounds that are the natural causes of its actions, and is so far the faculty of a being that itself belongs to appearances, but is also referred to objective grounds, that are only ideas, so far as they can determine this faculty, a connection which is expressed by the word ought. This faculty is called reason, and, so far as we consider a being (man) entirely according to this objectively determinable reason, he cannot be considered as a being of sense, but this property is that of a thing in itself, of which we cannot comprehend the possibility-I mean how the ought (which however has never yet taken place) should determine its activity, and can become the cause of actions, whose effect is an appearance in the sensible world. Yet the causality of reason would be freedom with regard to the effects in the sensuous world, so far as we can consider objective grounds, which are themselves ideas, as their determinants. For its action in that case would not depend upon subjective conditions, consequently not upon those of time, and of course not upon the law of nature, which serves to determine them, because grounds of reason give to actions the rule universally, according to principles, without the influence of the circumstances of either time or place.

What I adduce here is merely meant as an example to make the thing intelligible, and does not necessarily belong to our problem, which must be decided from mere concepts, independently of the properties which we meet in the actual world.

Now I may say without contradiction: that all the actions of rational beings, so far as they are appearances (occurring in any experience), are subject to the necessity of nature; but the same actions, as regards merely the rational subject and its faculty of acting according to mere reason, are free. For what is required for the necessity of nature? Nothing more than the determinability of every event in the world of sense according to constant laws, that is, a reference to cause in the appearance; in this process the thing in itself at its foundation and its causality remain unknown. But I say, that the law of nature remains, whether the rational being is the cause of the effects

in the sensuous world from reason, that is, through freedom, or whether it does not determine them on grounds of reason. For, if the former is the case, the action is performed according to maxims, the effect of which as appearance is always conformable to constant laws; if the latter is the case, and the action not performed on principles of reason, it is subjected to the empirical laws of the sensibility, and in both cases the effects are connected according to constant laws; more than this we do not require or know concerning natural necessity. But in the former case reason is the cause of these laws of nature, and therefore free; in the latter the effects follow according to mere natural laws of sensibility, because reason does not influence it; but reason itself is not determined on that account by the sensibility, and is therefore free in this case too. Freedom is therefore no hindrance to natural law in appearance, neither does this law abrogate the freedom of the practical use of reason, which is connected with things in themselves, as determining grounds.

Thus practical freedom, viz., the freedom in which reason possesses causality according to objectively determining grounds, is rescued and yet natural necessity is not in the least curtailed with regard to the very same effects, as appearances. The same remarks will serve to explain what we had to say concerning transcendental freedom and its compatibility with natural necessity (in the same subject, but not taken in the same reference). For, as to this, every beginning of the action of a being from objective causes regarded as determining grounds, is always a first start, though the same action is in the series of appearances only a subordinate start, which must be preceded by a state of the cause, which determines it, and is itself determined in the same manner by another immediately preceding. Thus we are able, in rational beings, or in beings generally, so far as their causality is determined in them as things in themselves, to imagine a faculty of beginning from itself a series of states, without falling into contradiction with the laws of nature. For the relation of the action to objective grounds of reason is not a time-relation; in this case that which determines the causality does not precede in time the action, because such determining grounds represent not a reference to objects of sense, e.g., to causes in the appearances, but to determining causes, as things in themselves, which do not rank under conditions of time. And in this way the action, with regard to the causality of reason, can be considered as a first start in respect to the series of appearances, and yet also as a merely subordinate beginning. We may therefore without contradiction consider it in the former aspect as free, but in the latter (in so far as it is merely appearance) as subject to natural necessity.

As to the fourth Antinomy, it is solved in the same way as the conflict of reason with itself in the third. For, provided the cause in the appearance is distinguished from the cause of the appearance (so far as it can be thought as a thing in itself), both propositions are perfectly reconcilable: the one, that there is nowhere in the sensuous world a cause (according to similar laws of causality), whose existence is absolutely necessary; the other, that this world is nevertheless connected with a Necessary Being as its cause (but of another kind and according to another law). The incompatibility of these propositions entirely rests upon the mistake of extending what is valid merely of appearances to things in themselves, and in

general confusing both in one concept.

Sect. 54. This then is the proposition and this the solution of the whole antinomy, in which reason finds itself involved in the application of its principles to the sensible world. The former alone (the mere proposition) would be a considerable service in the cause of our knowledge of human reason, even though the solution might fail to fully satisfy the reader, who has here to combat a natural illusion, which has been but recently exposed to him, and which he had hitherto always regarded as genuine. For one result at least is unavoidable. As it is quite impossible to prevent this conflict of reason with itself-so long as the objects of the sensible world are taken for things in themselves, and not for mere appearances, which they are in fact-the reader is thereby compelled to examine over again the deduction of all our a priori cognition and the proof which I have given of my deduction in order to come to a decision on the question. This is all I require at present; for when in this occupation he shall have thought himself deep enough into the nature of pure reason, those concepts by which alone the solution of the conflict of reason is possible, will become sufficiently familiar to him. Without this preparation I cannot expect an unreserved assent even from the most attentive reader.

III. The Theological Idea.34

Sect. 55. The third transcendental Idea, which affords matter for the most important, but, if pursued only speculatively, transcendent and thereby dialectical use of reason, is the ideal of pure reason. Reason in this case does not, as with the psychological and the cosmological Ideas, begin from experience, and err by exaggerating its grounds, in striving to attain, if possible, the absolute completeness of their series. It rather totally breaks with experience, and from mere concepts of what constitutes the absolute completeness of a thing in general, consequently by means of the idea of a most perfect primal Being, it proceeds to determine the possibility and therefore the actuality of all other things. And so the mere presupposition of a Being, who is conceived not in the series of experience, yet for the purposes of experience-for the sake of comprehending its connection, order, and unity -i.e., the idea [the notion of it], is more easily distinguished from the concept of the understanding here, than in the former cases. Hence we can easily expose the dialectical illusion which arises from our making the subjective conditions of our thinking objective conditions of objects themselves, and an hypothesis necessary for the satisfaction of our reason, a dogma. As the observations of the Critique on the pretensions of transcendental theology are intelligible, clear, and decisive, I have nothing more to add on the subject.

General Remark on the Transcendental Ideas.

Sect. 56. The objects, which are given us by experience, are in many respects incomprehensible, and many questions, to which the law of nature leads us, when carried beyond a certain point (though quite conformably to the laws of nature), admit of no answer; as for example the question: why substances attract one another? But if we entirely quit nature, or in pursuing its combinations, exceed all possible experience, and so enter the

realm of mere ideas, we cannot then say that the object is incomprehensible, and that the nature of things proposes to us insoluble problems. For we are not then concerned with nature or in general with given objects, but with concepts, which have their origin merely in our reason, and with mere creations of thought; and all the problems that arise from our notions of them must be solved, because of course reason can and must give a full account of its own procedure.35 As the psychological, cosmological, and theological Ideas are nothing but pure concepts of reason, which cannot be given in any experience, the questions which reason asks us about them are put to us not by the objects, but by mere maxims of our reason for the sake of its own satisfaction. They must all be capable of satisfactory answers, which is done by showing that they are principles which bring our use of the understanding into thorough agreement, completeness, and synthetical unity, and that they so far hold good of experience only, but of experience as a whole.

Although an absolute whole of experience is impossible, the idea of a whole of cognition according to principles must impart to our knowledge a peculiar kind of unity, that of a system, without which it is nothing but piecework, and cannot be used for proving the existence of a highest purpose (which can only be the general system of all purposes), I do not here refer only to the practical, but also to the highest purpose of the speculative use of reason.

The transcendental Ideas therefore express the peculiar application of reason as a principle of systematic unity in the use of the understanding. Yet if we assume this unity of the mode of cognition to be attached to the object of cognition, if we regard that which is merely regulative to be constitutive, and if we persuade ourselves that we can by means of these Ideas enlarge our cognition transcendently, or far beyond all possible experience, while it only serves to render experience within itself as nearly complete as possible, i.e., to limit its progress by nothing that cannot belong to experience: we suffer from a mere misunderstanding in our estimate of the proper application of our reason and of its principles, and from a Dialectic, which both confuses the empirical use of reason, and also sets reason at variance with itself.

* * * *

CONCLUSION: ON THE DETERMINATION OF THE BOUNDS OF PURE REASON.

Sect. 57. Having adduced the clearest arguments, it would be absurd for us to hope that we can know more of any object, than belongs to the possible experience of it, or lay claim to the least atom of knowledge about anything not assumed to be an object of possible experience, which would determine it according to the constitution it has in itself. For how could we determine anything in this way, since time, space, and the categories, and still more all the concepts formed by empirical experience or perception in the sensible world [Anschauung], have and can have no other use, than to make experience possible. And if this condition is omitted from the pure concepts of the understanding, they do not determine any object, and have no meaning whatever.

But it would be on the other hand a still greater absurdity

if we conceded no things in themselves, or set up our experience for the only possible mode of knowing things, our way of beholding [Anschauung] them in space and in time for the only possible way, and our discursive understanding for the archetype of every possible understanding; in fact if we wished to have the principles of the possibility of experience considered universal conditions of things in themselves.

Our principles, which limit the use of reason to possible experience, might in this way become transcendent, and the limits of our reason be set up as limits of the possibility of things in themselves (as Hume's dialogues may illustrate), if a careful critique did not guard the bounds of our reason with respect to its empirical use, and set a limit to its pretensions. Skepticism originally arose from metaphysics and its licentious dialectics. At first it might, merely to favor the empirical use of reason, announce everything that transcends this use as worthless and deceitful; but by and by, when it was perceived that the very same principles that are used in experience, insensibly, and apparently with the same right, led still further than experience extends, then men began to doubt even the propositions of experience. But here there is no danger; for common sense will doubtless always assert its rights. A certain confusion, however, arose in science which cannot determine how far reason is to be trusted, and why only so far and no further, and this confusion can only be cleared up and all future relapses obviated by a formal determination, on principle, of the boundary of the use of our reason.

We cannot indeed, beyond all possible experience, form a definite notion of what things in themselves may be. Yet we are not at liberty to abstain entirely from inquiring into them; for experience never satisfies reason fully, but in answering questions, refers us further and further back, and leaves us dissatisfied with regard to their complete solution. This any one may gather from the Dialectics of pure reason, which therefore has its good subjective grounds. Having acquired, as regards the nature of our soul, a clear conception of the subject, and having come to the conviction, that its manifestations cannot be explained materialistically, who can refrain from asking what the soul really is, and, if no concept of experience suffices for the purpose, from accounting for it by a concept of reason (that of a simple immaterial being), though we cannot by any means prove its objective reality? Who can satisfy himself with mere empirical knowledge in all the cosmological questions of the duration and of the quantity of the world, of freedom or of natural necessity, since every answer given on principles of experience begets a fresh question, which likewise requires its answer and thereby clearly shows the insufficiency of all physical modes of explanation to satisfy reason? Finally, who does not see in the thoroughgoing contingency and dependence of all his thoughts and assumptions on mere principles of experience, the impossibility of stopping there? And who does not feel himself compelled, notwithstanding all interdictions against losing himself in transcendent ideas, to seek rest and contentment beyond all the concepts which he can vindicate by experience, in the concept of a Being, the possibility of which we cannot conceive, but at the same time cannot be refuted, because it relates to a mere being of the understanding, and without it reason must needs remain forever dissatisfied?

Bounds (in extended beings) always presuppose a space existing outside a certain definite place, and enclosing it; limits do not require this, but are mere negations, which affect a quantity, so far as it is not absolutely complete. But our reason, as it were, sees in its surroundings a space for the cognition of things in themselves, though we can never have definite notions of them, and are limited to appearances only.

As long as the cognition of reason is homogeneous, definite bounds to it are inconceivable. In mathematics and in natural philosophy human reason admits of limits but not of bounds, viz., that something indeed lies without it, at which it can never arrive, but not that it will at any point find completion in its internal progress. The enlarging of our views in mathematics, and the possibility of new discoveries, are infinite; and the same is the case with the discovery of new properties of nature, of new powers and laws, by continued experience and its rational combination. But limits cannot be mistaken here, for mathematics refers to appearances only, and what cannot be an object of sensuous contemplation, such as the concepts of metaphysics and of morals, lies entirely without its sphere, and it can never lead to them; neither does it require them. It is therefore not a continual progress and an approximation towards these sciences, and there is not, as it were, any point or line of contact. Natural science will never reveal to us the internal constitution of things, which though not appearance, yet can serve as the ultimate ground of explaining appearance. Nor does that science require this for its physical explanations. Nay even if such grounds should be offered from other sources (for instance, the influence of immaterial beings), they must be rejected and not used in the progress of its explanations. For these explanations must only be grounded upon that which as an object of sense can belong to experience, and be brought into connection with our actual perceptions and empirical laws.

But metaphysics leads us towards bounds in the dialectical attempts of pure reason (not undertaken arbitrarily or wantonly, but stimulated thereto by the nature of reason itself). And the transcendental Ideas, as they do not admit of evasion, and are never capable of realization, serve to point out to us actually not only the bounds of the pure use of reason, but also the way to determine them. Such is the end and the use of this natural predisposition of our reason, which has brought forth metaphysics as its favorite child, whose generation, like every other in the world, is not to be ascribed to blind chance, but to an original germ, wisely organized for great ends. For metaphysics, in its fundamental features, perhaps more than any other science, is placed in us by nature itself, and cannot be considered the production of an arbitrary choice or a casual enlargement in the progress of experience from which it is quite disparate.

Reason with all its concepts and laws of the understanding, which suffice for empirical use, i.e., within the sensible world, finds in itself no satisfaction because ever-recurring questions deprive us of all hope of their complete solution. The transcendental ideas, which have that completion in view, are such problems of reason. But it sees clearly, that the sensuous world cannot contain this completion, neither consequently can all the concepts, which serve merely for understanding the world of sense, such as space and time, and whatever we have adduced under the name of pure concepts of the understanding. The

sensuous world is nothing but a chain of appearances connected according to universal laws; it has therefore no subsistence by itself; it is not the thing in itself, and consequently must point to that which contains the basis of this experience, to beings which cannot be known merely as phenomena, but as things in themselves. In the cognition of them alone reason can hope to satisfy its desire of completeness in proceeding from the conditioned to its conditions.

We have above (Sects. 33, 34) indicated the limits of reason with regard to all cognition of mere creations of thought. Now, since the transcendental ideas have urged us to approach them, and thus have led us, as it were, to the spot where the occupied space (viz., experience) touches the void (that of which we can know nothing, viz., noumena), we can determine the bounds of pure reason. For in all bounds there is something positive (e.g., a surface is the boundary of corporeal space, and is therefore itself a space, a line is a space, which is the boundary of the surface, a point the boundary of the line, but yet always a place in space), whereas limits contain mere negations. The limits pointed out in those paragraphs are not enough after we have discovered that beyond them there still lies something (though we can never know what it is in itself). For the question now is, What is the attitude of our reason in this connection of what we know with what we do not, and never shall, know? This is an actual connection of a known thing with one quite unknown (and which will always remain so), and though what is unknown should not become the least more known-which we cannot even hope-yet the notion of this connection must be definite, and capable of being rendered distinct.

We must therefore accept an immaterial being, a world of understanding, and a Supreme Being (all mere noumena), because in them only, as things in themselves, reason finds that completion and satisfaction, which it can never hope for in the derivation of appearances from their homogeneous grounds, and because these actually have reference to something distinct from them (and totally heterogeneous), as appearances always presuppose an object in itself, and therefore suggest its existence whether we can know more of it or not.

But as we can never know these beings of understanding as they are in themselves, that is, definitely, yet must assume them as regards the sensible world, and connect them with it by reason, we are at least able to think this connection by means of such concepts as express their relation to the world of sense. Yet if we represent to ourselves a being of the understanding by nothing but pure concepts of the understanding, we then indeed represent nothing definite to ourselves, consequently our concept has no significance; but if we think it by properties borrowed from the sensuous world, it is no longer a being of understanding, but is conceived as an appearance, and belongs to the sensible world. Let us take an instance from the notion of the Supreme Being.

Our deistic conception is quite a pure concept of reason, but represents only a thing containing all realities, without being able to determine any one of them; because for that purpose an example must be taken from the world of sense, in which case we should have an object of sense only, not something quite heterogeneous, which can never be an object of sense. Suppose I

attribute to the Supreme Being understanding, for instance; I have no concept of an understanding other than my own, one that must receive its perceptions [Anschauung] by the senses, and which is occupied in bringing them under rules of the unity of consciousness. Then the elements of my concept would always lie in the appearance; I should however by the insufficiency of the appearance be necessitated to go beyond them to the concept of a being which neither depends upon appearance, nor is bound up with them as conditions of its determination. But if I separate understanding from sensibility to obtain a pure understanding, then nothing remains but the mere form of thinking without perception [Anschauung], by which form alone I can know nothing definite, and consequently no object. For that purpose I should conceive another understanding, such as would directly perceive its objects,36 but of which I have not the least notion; because the human understanding is discursive, and can [not directly perceive, it can] only know by means of general concepts. And the very same difficulties arise if we attribute a will to the Supreme Being; for we have this concept only by drawing it from our internal experience, and therefore from our dependence for satisfaction upon objects whose existence we require; and so the notion rests upon sensibility, which is absolutely incompatible with the pure concept of the Supreme Being.

Hume's objections to deism are weak, and affect only the proofs, and not the deistic assertion itself. But as regards theism, which depends on a stricter determination of the concept of the Supreme Being which in deism is merely transcendent, they are very strong, and as this concept is formed, in certain (in fact in all common) cases irrefutable. Hume always insists, that by the mere concept of an original being, to which we apply only ontological predicates (eternity, omnipresence, omnipotence), we think nothing definite, and that properties which can yield a concept in concrete must be superadded; that it is not enough to say, it is Cause, but we must explain the nature of its causality, for example, that of an understanding and of a will. He then begins his attacks on the essential point itself, i.e., theism, as he; had previously directed his battery only against the proofs of deism, an attack which is not very dangerous to it in its consequences. All his dangerous arguments refer to anthropomorphism, which he holds to be inseparable from theism, and to make it absurd in itself; but if the former be abandoned, the latter must vanish with it, and nothing remain but deism, of which nothing can come, which is of no value, and which cannot serve as any foundation to religion or morals. If this anthropomorphism were really unavoidable, no proofs whatever of the existence of a Supreme Being, even were they all granted, could determine for us the concept of this Being without involving us in contradictions.

If we connect with the command to avoid all transcendent judgments of pure reason, the command (which apparently conflicts with it) to proceed to concepts that lie beyond the field of its immanent (empirical) use, we discover that both can subsist together, but only at the boundary of all lawful use of reason. For this boundary belongs as well to the field of experience, as to that of the creations of thought, and we are thereby taught, as well, bow these so remarkable ideas serve merely for marking the bounds of human reason. On the one hand they give warning not boundlessly to extend cognition of experience, as if nothing but world37 I remained for us to know, and yet, on the other hand,

not to transgress the bounds of experience, and to think of judging about things beyond them, as things in themselves.

But we stop at this boundary if we limit our judgment merely to the relation which the world may have to a Being whose very concept lies beyond all the knowledge which we can attain within the world. For we then do not attribute to the Supreme Being any of the properties in themselves, by which we represent objects of experience, and thereby avoid dogmatic anthropomorphism; but we attribute them to his relation to the world, and allow ourselves a symbolical anthropomorphism, which in fact concerns language only, and not the object itself.

If I say that we are compelled to consider the world, as if it were the work of a Supreme Understanding and Will, I really say nothing more, than that a watch, a ship, a regiment, bears the same relation to the watchmaker, the shipbuilder, the commanding officer, as the world of sense (or whatever constitutes the substratum of this complex of appearances) does to the Unknown, which I do not hereby know as it is in itself, but as it is for me or in relation to the world, of which I am a part.

Sect. 58. Such a cognition is one of analogy, and does not signify (as is commonly understood) an imperfect similarity of two things, but a perfect similarity of relations between two quite dissimilar things.38 By means of this analogy, however, there remains a concept of the Supreme Being sufficiently determined for us, though we have left out everything that could determine it absolutely or in itself; for we determine it as regards the world and as regards ourselves, and more do we not require. The attacks which Hume makes upon those who would determine this concept absolutely, by taking the materials for so doing from themselves and the world, do not affect us; and he cannot object to us, that we have nothing left if we give up the objective anthropomorphism of the concept of the Supreme Being.

For let us assume at the outset (as Hume in his dialogues makes Philo grant Cleanthes), as a necessary hypothesis, the deistical concept of the First Being, in which this Being is thought by the mere ontological predicates of substance, of cause, etc. This must be done, because reason, actuated in the sensible world by mere conditions, which are themselves always conditional, cannot otherwise have any satisfaction, and it therefore can be done without falling into anthropomorphism (which transfers predicates from the world of sense to a Being quite distinct from the world), because those predicates are mere categories, which, though they do not give a determinate concept of God, yet give a concept not limited to any conditions of sensibility. Thus nothing can prevent our predicating of this Being a causality through reason with regard to the world, and thus passing to theism, without being obliged to attribute to God in himself this kind of reason, as a property inhering in him. For as to the former, the only possible way of prosecuting the use of reason (as regards all possible experience, in complete harmony with itself) in the world of sense to the highest point, is to assume a supreme reason as a cause of all the connections in the world. Such a principle must be quite advantageous to reason and can hurt it nowhere in its application to nature. As to the latter, reason is thereby not transferred as a property to the First Being in himself, but only to his relation to the world

of sense, and so anthropomorphism is entirely avoided. For nothing is considered here but the cause of the form of reason which is perceived everywhere in the world, and reason is attributed to the Supreme Being, so far as it contains the ground of this form of reason in the world, but according to analogy only, that is, so far as this expression shows merely the relation, which the Supreme Cause unknown to us has to the world, in order to determine everything in it conformably to reason in the highest degree. We are thereby kept from using reason as an attribute for the purpose of conceiving God, but instead of conceiving the world in such a manner as is necessary to have the greatest possible use of reason according to principle. We thereby acknowledge that the Supreme Being is quite inscrutable and even unthinkable in any definite way as to what he is in himself. We are thereby kept, on the one band, from making a transcendent use of the concepts which we have of reason as an efficient cause (by means of the will), in order to determine the Divine Nature by properties, which are only borrowed from human nature, and from losing ourselves in gross and extravagant notions, and on the other hand from deluging the contemplation of the world with hyperphysical modes of explanation according to our notions of human reason, which we transfer to God, and so losing for this contemplation its proper application, according to which it should be a rational study of mere nature, and not a presumptuous derivation of its appearances from a Supreme Reason. The expression suited to our feeble notions is, that we conceive the world as if it came, as to its existence and internal plan, from a Supreme Reason, by which notion we both know the constitution, which belongs to the world itself, yet without pretending to determine the nature of its cause in itself, and on the other hand, we transfer the ground of this constitution (of the form of reason in the world) upon the relation of the Supreme Cause to the world, without finding the world sufficient by itself for that purpose.39

Thus the difficulties which seem to oppose theism -disappear by combining with Hume's principle -- "not to carry the use of reason dogmatically beyond the field of all possible experience" -- this other principle, which be quite overlooked: "not to consider the field of experience as one which bounds itself in the eye of our reason." The Critique of Pure Reason here points out the true mean between dogmatism, which Hume combats, and skepticism, which he would substitute for it-a mean which is not like other means that we find advisable to determine for ourselves as it were mechanically (by adopting something from one side and something from the other), and by which nobody is taught a better way, but such a one as can be accurately determined on principles.

Sect. 59. At the beginning of this annotation I made use of the metaphor of a boundary, in order to establish the limits of reason in regard to its suitable use. The world of sense contains merely appearances, which are not things in themselves, but the understanding must assume these latter ones, viz., noumena. In our reason both are comprised, and the question is, How does reason proceed to set boundaries to the understanding as regards both these fields? Experience, which contains all that belongs to the sensuous world, does not bound itself; it only proceeds in every case from the conditioned to some other equally conditioned object. Its boundary must lie quite without it, and this field is that of the pure beings of the understanding. But this field, so

far as the determination of the nature of these beings is concerned, is an empty space for us, and if dogmatically-determined concepts alone are in question, we cannot pass out of the field of possible experience. But as a boundary itself is something positive, which belongs as well to that which lies within, as to the space that lies without the given complex, it is still an actual positive cognition, which reason only acquires by enlarging itself to this boundary, yet without attempting to pass it; because it there finds itself in the presence of an empty space, in which it can conceive forms of things, but not things themselves. But the setting of a boundary to the field of the understanding by something, which is otherwise unknown to it, is still a cognition which belongs to reason even at this standpoint, and by which it is neither confined within the sensible, nor straying without it, but only refers, as befits the knowledge of a boundary, to the relation between that which lies without it, and that which is contained within it.

Natural theology is such a concept at the boundary of human reason, being constrained to look beyond this boundary to the Idea of a Supreme Being (and, for practical purposes to that of an intelligible world also), not in order to determine anything relatively to this pure creation of the understanding, which lies beyond the world of sense, but in order to guide the use of reason within it according to principles of the greatest possible (theoretical as well as practical) unity. For this purpose we make use of the reference of the world of sense to an independent reason, as the cause of all its connections. Thereby we do not purely invent a being, but, as beyond the sensible. world there must be something that can only be thought by the pure understanding, we determine that something in this particular way, though only of course according to analogy.

And thus there remains our original proposition, which is the resume of the whole Critique: "that reason by all its a priori principles never teaches us anything more than objects of possible experience, and even of these nothing more than can be known in experience." But this limitation does not prevent reason leading us to the objective boundary of experience, viz., to the reference to something which is not itself an object of experience, but is the ground of all experience. Reason does not however teach us anything concerning the thing in itself: it only instructs us as regards its own complete and highest use in the field of possible experience. But this is all that can be reasonably desired in the present case, and with which we have cause to be satisfied.

Sect. 60. Thus we have fully exhibited metaphysics as 'it is actually given in the natural predisposition of human reason, and in that which constitutes the essential end of its pursuit, according to its subjective possibility. Though we have found, that this merely natural use of such a predisposition of our reason, if no discipline arising only from a scientific critique bridles and sets limits to it, involves us in transcendent, either apparently or really conflicting, dialectical syllogisms; and this fallacious metaphysics is not only unnecessary as regards the promotion of our knowledge of nature, but even disadvantageous to it: there yet remains a problem worthy of solution, which is to find out the natural ends intended by this disposition to transcendent concepts in our reason, because everything that lies in nature must be originally intended for

some useful purpose.

Such an inquiry is of a doubtful nature; and I .acknowledge, that what I can say about it is conjecture only, like every speculation about the first ends of nature. The question does not concern the objective validity of metaphysical judgments, but our natural predisposition to them, and therefore does not belong to the system of metaphysics but to anthropology.

When I compare all the transcendental Ideas, the totality of which constitutes the particular problem of natural pure reason, compelling it to quit the mere contemplation of nature, to transcend all possible experience, and in this endeavor to produce the thing (be it knowledge or fiction) called metaphysics, I think I perceive that the aim of this natural tendency is, to free our notions from the fetters of experience and from the limits of the mere contemplation of nature so far as at least to open to us a field containing mere objects for the pure understanding, which no sensibility can reach, not indeed for the purpose of speculatively occupying ourselves with them (for there we can find no ground to stand on), but because practical principles, which, without finding some such scope for their necessary expectation and hope, could not expand to the universality which reason unavoidably requires from a moral point of view.

So I find that the Psychological Idea (however little it may reveal to me the nature of the human soul, which is higher than all concepts of experience), shows the insufficiency of these concepts plainly enough, and thereby deters me from materialism, the psychological notion of which is unfit for any explanation of nature, and besides confines reason in practical respects. The Cosmological Ideas, by the obvious insufficiency of all possible cognition of nature to satisfy reason in its lawful inquiry, serve in the same manner to keep us from naturalism, which asserts nature to be sufficient for itself. Finally, all natural necessity in the sensible world is conditional, as it always presupposes the dependence of things upon others, and unconditional necessity must be sought only in the unity of a cause different from the world of sense. But as the causality of this cause, in its turn, were it merely nature, could never render the existence of the contingent (as its consequent) comprehensible, reason frees itself by means of the Theological Idea from fatalism, (both as a blind natural necessity in the coherence of nature itself, without a first principle, and as a blind causality of this principle itself), and leads to the concept of a cause possessing freedom, or of a Supreme Intelligence. Thus the transcendental Ideas serve, if not to instruct us positively, at least to destroy the rash assertions of Materialism, of Naturalism, and of Fatalism, and thus to afford scope for the moral Ideas beyond the field of speculation. These considerations, I should think, explain in some measure the natural predisposition of which I spoke.

The practical value, which a merely speculative science may have, lies without the bounds of this science, and can therefore be considered as a scholion merely, and like all scholia does not form part of the science itself. This application however surely lies within the bounds of philosophy, especially of philosophy drawn from the pure sources of reason, where its speculative use in metaphysics must necessarily be at unity with its practical

use in morals. Hence the unavoidable dialectics of pure reason, considered in metaphysics, as a natural tendency, deserves to be explained not as an illusion merely, which is to be removed, but also, if possible, as a natural provision as regards its end, though this duty, a work of supererogation, cannot justly be assigned to metaphysics proper.

The solutions of these questions which are treated in the chapter on the Regulative Use of the Ideas of Pure Reason40 should be considered a second scholion which however has a greater affinity with the subject of metaphysics. For there certain rational principles are expounded which determine a priori the order of nature or rather of the understanding, which seeks nature's laws through experience. They seem to be constitutive and legislative with regard to experience, though they spring from pure reason, which cannot be considered, like the understanding, as a principle of possible experience. Now whether or not this harmony rests upon the fact, that just as nature does not inhere in appearances or in their source (the sensibility) itself, but only in so far as the latter is in relation to the understanding, as also a systematic unity in applying the understanding to bring about an entirety of all possible experience can only belong to the understanding when in relation to reason; and whether or not experience is in this way mediately subordinate to the legislation of reason: may be discussed by those who desire to trace the nature of reason even beyond its use in metaphysics, into the general principles of a history of nature; I have represented this task as important, but not attempted its solution, in the book itself.41

And thus I conclude the analytical solution of the main question which I had proposed: How is metaphysics in general possible? by ascending from the data of its actual use in its consequences, to the grounds of its possibility.

* * * *

SOLUTION OF THE GENERAL QUESTION OF THE PROLEGOMENA: "HOW IS METAPHYSICS POSSIBLE AS A SCIENCE?"

Metaphysics, as a natural disposition of reason, is actual, but if considered by itself alone (as the analytical solution of the third principal question showed), dialectical and illusory. If we think of taking principles from it, and in using them follow the natural, but on that account not less false, illusion, we can never produce science, but only a vain dialectical art, in which one school may outdo another, but none can ever acquire a just and lasting approbation.

In order that as a science metaphysics may be entitled to claim not mere fallacious plausibility, but insight and conviction, a Critique of Reason must itself exhibit the whole stock of a priori concepts, their division according to their various sources (Sensibility, Understanding, and Reason), together with a complete table of them, the analysis of all these concepts, with all their consequences, especially by means of the deduction of these concepts, the possibility of synthetical cognition a priori, the principles of its application and finally its bounds, all in a complete system. Critique, therefore, and critique alone, contains in itself the whole well-proved and well-tested plan, and even all the means required to accomplish

metaphysics, as a science; by other ways and means it is impossible. The question here therefore is not so much how this performance is possible, as how to set it going, and induce men of clear heads to quit their hitherto perverted and fruitless cultivation for one that will not deceive, and how such a union for the common end may best be directed.

This much is certain, that whoever has once tasted Critique will be ever after disgusted with all dogmatical twaddle which be formerly put up with, because his reason must have something, and could find nothing better for its support.

Critique stands in the same relation to the common metaphysics of the schools, as chemistry does to alchemy, or as astronomy to the astrology of the fortune-teller. I pledge myself that nobody who has read through and through, and grasped the principles of, the Critique even in these Prolegomena only, will ever return to that old and sophistical pseudo-science; but will rather with a certain delight look forward to metaphysics which is now indeed in his power, requiring no more preparatory discoveries, and now at last affording permanent satisfaction to reason. For here is an advantage upon which, of all possible sciences, metaphysics alone can with certainty reckon: that it can be brought to such completion and fixity as to be incapable of further change, or of any augmentation by new discoveries; because here reason has the sources of its knowledge in itself, not in objects and their observation [Anschauung], by which latter its stock of knowledge cannot be further increased. When therefore it has exhibited the fundamental laws of its faculty completely and so definitely as to avoid all misunderstanding, there remains nothing for pure reason to know a priori, nay, there is even no ground to raise further questions. The sure prospect of knowledge so definite and so compact has a peculiar charm, even though we should set aside all its advantages, of which I shall hereafter speak.

All false art, all vain wisdom, lasts its time, but finally destroys itself, and its highest culture is also the epoch of its decay. That this time is come for metaphysics appears from the state into which it has fallen among all learned nations, despite of all the zeal with which other sciences of every kind are prosecuted. The old arrangement of our university studies still preserves its shadow; now and then an Academy of Science tempts men by offering prizes to write essays on it, but it is no longer numbered among thorough sciences; and let any one judge for himself how a man of genius, if he were called a great metaphysician, would receive the compliment, which may be well-meant, but is scarce envied by anybody.

Yet, though the period of the downfall of all dogmatical metaphysics has undoubtedly arrived, we are yet far from being able to say that the period of its regeneration is come by means of a thorough and complete Critique of Reason. All transitions from a tendency to its contrary pass through the stage of indifference, and this moment is the most dangerous for an author, but, in my opinion, the most favorable for the science. For, when party spirit has died out by a total dissolution of former connections, minds are in the best state to listen to several proposals for an organization according to a new plan.

When I say, that I hope these Prolegomena will excite

investigation in the field of critique and afford a new and promising object to sustain the general spirit of philosophy, which seems on its speculative side to want sustenance, I can imagine beforehand, that every one, whom the thorny paths of my Critique have tired and put out of humor, will ask me, upon what I found this hope. My answer is, upon the irresistible law of necessity.

That the human mind will ever give up metaphysical researches is as little to be expected as that we should prefer to give up breathing altogether, to avoid inhaling impure air. There will therefore always be metaphysics in the world; nay, every one, especially every man of reflection, will have it, and for want of a recognized standard, will shape it for himself after his own pattern. What has hitherto been called metaphysics, cannot satisfy any critical mind, but to forego it entirely is impossible; therefore a Critique of Pure Reason itself must now be attempted or, if one exists, investigated, and brought to the full test, because there is no other means of supplying this pressing want, which is something more than mere thirst for knowledge.

Ever since I have come to know critique, whenever I finish reading a book of metaphysical contents, which, by the preciseness of its notions, by variety, order, and an easy style, was not only entertaining but also helpful, I cannot help asking, 11 Has this author indeed advanced metaphysics a single step?" The learned men, whose works have been useful to me in other respects and always contributed to the culture of my mental powers, will, I hope, forgive me for saying, that I have never been able to find either their essays or my own less important ones (though self-love may recommend them to me) to have advanced the science of metaphysics in the least, and why?

Here is the very obvious reason: metaphysics did not then exist as a science, nor can it be gathered piecemeal, but its germ must be fully preformed in the Critique. But in order to prevent all misconception, we must remember what has been already said, that by the analytical treatment of our concepts the understanding gains indeed a great deal, but the science (of metaphysics) is thereby not in the least advanced, because these dissections of concepts are nothing but the materials from which the intention is to carpenter our science. Let the concepts of substance and of accident be ever so well dissected and determined, all this is very well as a preparation for some future use. But if we cannot prove, that in all which exists the substance endures, and only the accidents vary, our science is not the least advanced by all our analyzes.

Metaphysics has hitherto never been able to prove a priori either this proposition, or that of sufficient reason, still less any more complex theorem, such as belongs to psychology or cosmology, or indeed any synthetical proposition. By all its analyzing therefore nothing is affected, nothing obtained or forwarded and the science, after all this bustle and noise, still remains as it was in the days of Aristotle, though far better preparations were made for it than of old, if the clue to synthetical cognitions had only been discovered.

If any one thinks himself offended, he is at liberty to refute my charge by producing a single synthetical proposition

belonging to metaphysics, which he would prove dogmatically a priori, for until he has actually performed this feat, I shall not grant that he has truly advanced the science; even should this proposition be sufficiently confirmed by common experience. No demand can be more moderate or more equitable, and in the (inevitably certain) event of its non-performance, no assertion more just, than that hitherto metaphysics has never existed as a science.

But there are two things which, in case the challenge be accepted, I must deprecate: first, trifling about probability and conjecture, which are suit-d as little to metaphysics, as to geometry; and secondly, a decision by means of the magic wand of common sense, which does not convince every one, but which accommodates itself to personal peculiarities.

For as to the former, nothing can be more absurd, than in metaphysics, a philosophy from pure reason to think of grounding our judgments upon probability and conjecture. Everything that is to be known a priori, is thereby announced as apodictically certain, and must therefore be proved in this way. We might as well think of grounding geometry or arithmetic upon conjectures. As to the doctrine of chances in the latter, it does not contain probable, but perfectly certain, judgments concerning the degree of the probability of certain cases, under given uniform conditions, which, in the sum of all possible cases, infallibly happen according to the rule, though it is not sufficiently determined in respect to every single chance. Conjectures (by means of induction and of analogy) can be suffered in an empirical science of nature only, yet even there the possibility at least of what we assume must be quite certain.

The appeal to common sense is even more absurd, when concept and principles are announced as valid, not in so far as they hold with regard to experience, but even beyond the conditions of experience. For what is common sense? It is normal good sense, so far it judges right. But what is normal good sense? It is the faculty of the knowledge and use of rules in concreto, as distinguished from the speculative understanding, which is a faculty of knowing rules in abstracto. Common sense can hardly understand the rule, 11 that every event is determined by means of its cause," and can never comprehend it thus generally. It therefore demands an example from experience, and when it hears that this rule means nothing but what it always thought when a pane was broken or a kitchen-utensil missing, it then understands the principle and grants it. Common sense therefore is only of use so far as it can see its rules (though they actually are a priori) confirmed by experience; consequently to comprehend them a priori, or independently of experience, belongs to the speculative understanding, and lies quite beyond the horizon of common sense. But the province of metaphysics is entirely confined to the latter kind of knowledge, and it is certainly a bad index of common sense to appeal to it as a witness, for it cannot here form any opinion whatever, and men look down upon it with contempt until they are in difficulties, and can find in their speculation neither in nor out.

It is a common subterfuge of those false friends of common sense (who occasionally prize it highly, but usually despise it) to say, that there must surely be at all events some propositions which are immediately certain, and of which there is no occasion

to give any proof, or even any account at all, because we otherwise could never stop inquiring into the grounds of our judgments. But if we except the principle of contradiction, which is not sufficient to show the truth of synthetical judgments, they can never adduce, in proof of this privilege, anything else indubitable, which they can immediately ascribe to common sense, except mathematical propositions, such as twice two make four, between two points there is but one straight line, etc. But these judgments are radically different from those of metaphysics. For in mathematics I myself can by thinking construct whatever I represent to myself as possible by a concept: I add to the first two the other two, one by one, and myself make the number four, or I draw in thought from one point to another all manner of lines, equal as well as unequal; yet I can draw one only, which is like itself in all its parts. But I cannot, by all my power of thinking, extract from the concept of a thing the concept of something else, whose existence is necessarily connected with the former, but I must call in experience. And though my understanding furnishes me a priori (yet only in reference to possible experience) with the concept of such a connection (i.e., causation), I cannot exhibit it, like the concepts of mathematics, by [Anschauung] visualizing them, a priori, and so show its possibility a priori. This concept, together with the principles of its application, always requires, if it shall hold a priori as is requisite in metaphysics -a justification and deduction of its possibility, because we cannot otherwise know how far it holds good, and whether it can be used in experience only or beyond it also.

Therefore in metaphysics, as a speculative science of pure reason, we can never appeal to common sense, but may do so only when we are forced to surrender it, and to renounce all purely speculative cognition, which must always be knowledge, and consequently when we forego metaphysics itself and its instruction, for the sake of adopting a rational faith which alone may be possible for us, and sufficient to our wants, perhaps even more salutary than knowledge itself. For in this case the attitude of the question is quite altered. Metaphysics must be science, not only as a whole, but in all its parts, otherwise it is nothing; because, as a speculation of pure reason, it finds a hold only on general opinions. Beyond its field, however, probability and common sense may be used with advantage and justly, but on quite special principles, of which the importance always depends on the reference to practical life.

This is what I hold myself justified in requiring for the possibility of metaphysics as a science.

* * * *

APPENDIX:
ON WHAT CAN BE DONE TO MAKE METAPHYSICS ACTUAL AS A SCIENCE.

Since all the ways heretofore taken have failed to attain the goal, and since without a preceding critique of pure reason it is not likely ever to be attained, the present essay now before the public has a fair title to an accurate and careful investigation, except it be thought more advisable to give up all pretensions to metaphysics, to which, if men but would consistently adhere to their purpose, no objection can be made.

If we take the course of things as it is, not as it ought to be, there are two sorts of judgments: (1) one a judgment which precedes investigation (in our case one in which the reader from his own metaphysics pronounces judgment on the Critique of Pure Reason which was intended to discuss the very possibility of metaphysics); (2) the other a judgment subsequent to investigation. In the latter the reader is enabled to waive for awhile the consequences of the critical researches that may be repugnant to his formerly adopted metaphysics, and first examines the grounds whence those consequences are derived. If what common metaphysics propounds were demonstrably certain, as for instance the theorems of geometry, the former way of judging would bold good. For if the consequences of certain principles are repugnant to established truths, these principles are false and without further inquiry to be repudiated. But if metaphysics does not possess a stock of indisputably certain (synthetical) propositions, and should it even be the case that there are a number of them, which, though among the most specious, are by their consequences in mutual collision, and if no sure criterion of the truth of peculiarly metaphysical (synthetical) propositions is to be met with in it, then the former way of judging is not admissible, but the investigation of the principles of the critique must precede all judgments as to its value.

On A Specimen Of A Judgment Of The Critique Prior To Its Examination.

This judgment is to be found in the Gottingischen gelehrten Anzeigen, in the supplement to the third division, of January 19, 1782, pages 40 et seq.

When an author who is familiar with the subject of his work and endeavors to present his independent reflections in its elaboration, falls into the hands of a reviewer who in his turn, is keen enough to discern the points on which the worth or worthlessness of the book rests, who does not cling to words, but goes to the heart of the subject, sifting and testing more than the mere principles which the author takes as his point of departure, the severity of the judgment may indeed displease the latter, but the public does not care, as it gains thereby; and the author himself may be contented, as an opportunity of correcting or explaining his positions is afforded to him at an early date by the examination of a competent judge, in such a manner, that if he believes himself fundamentally right, he can remove in time any stone of offense that might hurt the success of his work.

I find myself, with my reviewer, in quite another position. He seems not to see at all the real matter of the investigation with which (successfully or unsuccessfully) I have been occupied. It is either impatience at thinking out a lengthy work, or vexation at a threatened reform of a science in which he believed he had brought everything to perfection long ago, or, what I am unwilling to imagine, real narrow-mindedness, that prevents him from ever carrying his thoughts beyond his school-metaphysics. In short, he passes impatiently in review a long series of propositions, by which, without knowing their premises, we can think nothing, intersperses here and there his censure, the reason of which the reader understands just as little as the

propositions against which it is directed; and hence [his report] can neither serve the public nor damage me, in the judgment of experts. I should, for these reasons, have passed over this judgment altogether, were it not that it may afford me occasion for some explanations which may in some cases save the readers of these Prolegomena from a misconception.

In order to take a position from which my reviewer could most easily set the whole work in a most unfavorable light, without venturing to trouble himself with any special investigation, he begins and ends by saying: "This work is a system of transcendent (or, as he translates it, of higher) Idealism."42

A glance at this line soon showed me the sort of criticism that I had to expect, much as though the reviewer were one who had never seen or heard of geometry, having found a Euclid, and coming upon various figures in turning over its leaves, were to say, on being asked his opinion of it: "The work is a text-book of drawing; the author introduces a peculiar terminology, in order to give dark, incomprehensible directions, which in the end teach nothing more than what every one can effect by a fair natural accuracy of eye, etc."

Let us see, in the meantime, what sort of an idealism it is that goes through my whole work, although it does not by a long way constitute the soul of the system.

The dictum of all genuine idealists from the Eleatic school to Bishop Berkeley, is contained in this formula: "All cognition through the senses and experience is nothing but sheer illusion, and only, in the ideas of the pure understanding and reason there is truth."

The principle that throughout dominates and determines my Idealism, is on the contrary: "All cognition of things merely from pure understanding or pure reason is nothing but sheer illusion, and only in experience is there truth."

But this is directly contrary to idealism proper. How came I then to use this expression for quite an opposite purpose, and how came my reviewer to see it everywhere?

The solution of this difficulty rests on something that could have been very easily understood from the general bearing of the work, if the reader had only desired to do so. Space and time, together with all that they contain, are not things nor qualities in themselves, but belong merely to the appearances of the latter: up to this point I am one in confession with the above idealists. But these, and amongst them more particularly Berkeley, regarded space as a mere empirical presentation that, like the phenomenon it contains, is only known to us by means of experience or perception, together with its determinations. I, on the contrary, prove in the first place, that space (and also time, which Berkeley did not consider) and all its determinations a priori, can be known by us, because, no less than time, it inheres in our sensibility as a pure form before all perception or experience and makes all intuition of the same, and therefore all its phenomena, possible. It follows from this, that as truth rests on universal and necessary laws as its criteria, experience, according to Berkeley, can have no criteria of truth,

because its phenomena (according to him) have nothing a priori at their foundation; whence it follows, that they are nothing but sheer illusion; whereas with us, space and time (in conjunction with the pure conceptions of the understanding) prescribe their law to all possible experience a priori, and at the same time afford the certain criterion for distinguishing truth from illusion therein.43

My so-called (properly critical) Idealism is of quite a special character, in that it subverts the ordinary idealism, and that through it all cognition a priori, even that of geometry, first receives objective reality, which, without my demonstrated ideality of space and time, could not be maintained by the most zealous realists. This being the state of the case, I could have wished, in order to avoid all misunderstanding, to have named this conception of mine otherwise, but to alter it altogether was impossible. It may be permitted me however, in future, as has been above intimated, to term it the formal, or better still, the critical Idealism, to distinguish it from the dogmatic Idealism of Berkeley, and from the skeptical Idealism of Descartes.

Beyond this, I find nothing further remarkable in the judgment of my book. The reviewer criticizes here and there, makes sweeping criticisms, a mode prudently chosen, since it does not betray one's own knowledge or ignorance; a single thorough criticism in detail, had it touched the main question, as is only fair, would have exposed, it may be my error, or it may be my reviewer's measure of insight into this species of research. It was, moreover, not a badly conceived plan, in order at once to take from readers (who are accustomed to form their conceptions of books from newspaper reports) the desire to read the book itself, to pour out in one breath a number of passages in succession, torn from their connection, and their grounds of proof and explanations, and which must necessarily sound senseless, especially considering how antipathetic they are to all school-metaphysics; to exhaust the reader's patience ad nauseam, and then, after having made me acquainted with the sensible proposition that persistent illusion is truth, to conclude with the crude paternal moralization: to what end, then, the quarrel with accepted language, to what end, and whence, the idealistic distinction? A judgment which seeks all that is characteristic of my book, first supposed to be metaphysically heterodox, in a mere innovation of the nomenclature, proves clearly that my would-be judge has understood nothing of the subject, and in addition, has not understood himself.44

My reviewer speaks like a man who is conscious of important and superior insight which he keeps hidden; for I am aware of nothing recent with respect to metaphysics that could justify his tone. But he should not withhold his discoveries from the world, for there are doubtless many who, like myself, have not been able to find in all the fine things that have for long past been written in this department, anything that has advanced the science by so much as a finger-breadth; we find indeed the giving a new point to definitions, the supplying of lame proofs with new crutches, the adding to the crazy-quilt of metaphysics fresh patches or changing its pattern; but all this is not what the world requires. The world is tired of metaphysical assertions; it wants the possibility of the science, the sources from which certainty therein can be derived, and certain criteria by which it may distinguish the dialectical illusion of pure reason from

truth. To this the critic seems to possess a key, otherwise he would never have spoken out in such a high tone.

But I am inclined to suspect that no such requirement of the science has ever entered his thoughts, for in that case he would have directed his judgment to this point, and even a mistaken atteriipt in such an important matter, would have won his respect. If that be the case, we are once more good friends. He may penetrate as deeply as he likes into metaphysics, without any one hindering him; only as concerns that which lies outside metaphysics, its sources, which are to be found in reason, he cannot form a judgment. That my suspicion is not without foundation, is proved by the fact that he does not mention a word about the possibility of synthetic knowledge a priori, the special problem upon the solution of which the fate of metaphysics wholly rests, and upon which my Critique (as well as the present Prolegomena) entirely hinges. The Idealism he encountered, and which he hung upon,: was only taken up in the doctrine as the sole means of solving the above problem (although it received its confirmation on other grounds), and hence he must have shown either that the above problem does not possess the importance I attribute to it (even in these Prolegomena), or that by my conception of appearances, it is either not solved at all, or can be better solved in another way; but I do not find a word of this in the criticism. The reviewer, then, understands nothing of my work, and possibly also nothing of the spirit and essential nature of metaphysics itself; and it is not, what I would rather assume, the hurry of a man incensed at the labor of plodding through so many obstacles, that threw an unfavorable shadow over the work lying before him, and made its fundamental features unrecognizable.

There is a good deal to be done before a learned journal, it matters not with what care its writers may be selected, can maintain its otherwise well-merited reputation, in the field of metaphysics as elsewhere. Other sciences and branches of knowledge have their standard. Mathematics has it, in itself; history and theology, in profane or sacred books; natural science and the art of medicine, in mathematics and experience; jurisprudence, in law books; and even matters of taste in the examples of the ancients. But for the judgment of the thing called metaphysics, the standard has yet to be found. I have made an attempt to determine it, as well as its use. What is to be done, then, until it be found, when works of this kind have to be judged of? If they are of a dogmatic character, -one may do what one likes; no one will play the master over others here for long, before some one else appears to deal with him in the same manner. If, however, they are critical in their character, not indeed with reference to other works, but to reason itself, so that the standard of judgment cannot be assumed but has first of all to be sought for, then, though objection and blame may indeed be permitted, yet a certain degree of leniency is indispensable, since the need is common to us all, and the lack of the necessary insight makes the high-handed attitude of judge unwarranted.

In order, however, to connect my defense with the interest of the philosophical commonwealth, I propose a test, which must be decisive as to the mode, whereby all metaphysical investigations may be directed to their common purpose. This is nothing more than what formerly mathematicians have done, in establishing the advantage of their methods by competition. I

challenge my critic to demonstrate, as is only just, on a priori grounds, in his way, a single really metaphysical principle asserted by him. Being metaphysical it must be synthetic and known a priori from conceptions, but it may also be any one of the most indispensable principles, as for instance, the principle of the persistence of substance, or of the necessary determination of events in the world by their causes. If he cannot do this (silence however is confession), he must admit, that as metaphysics without apodictic certainty of propositions of this kind is nothing at all, its possibility or impossibility must before all things be established in a critique of the pure reason. Thus he is bound either to confess that my principles in the Critique are correct, or he must prove their invalidity. But as I can already foresee, that, confidently as he has hitherto relied on the certainty of his principles, when it comes to a strict test he will not find a single one in the whole range of metaphysics he can bring forward, I will concede to him an advantageous condition, which can only be expected in such a competition, and will relieve him of the onus probandi by laying it on myself.

He finds in these Prolegomena and in my Critique (chapter on the "Theses and Antitheses Antinomies") eight propositions, of which two and two contradict one another, but each of which necessarily belongs to metaphysics, by which it must either be accepted or rejected (although there is not one that has not in this time been held by some philosopher). Now he has the liberty of selecting any one of these eight propositions at his pleasure, and accepting it without any proof, of which I shall make him a present, but only one (for waste of time will be just as little serviceable to him as to me), and then of attacking my proof of the opposite proposition. If I can save this one, and at the same time show, that according to principles which every dogmatic metaphysics must necessarily recognize, the opposite of the proposition adopted by him can be just as clearly proved, it is thereby established that metaphysics has an hereditary failing, not to be explained, much less set aside, until we ascend to its birth-place, pure reason itself, and thus my Critique must either be accepted or a better one take its place; it must at least be studied, which is the only thing I now require. If, on the other hand, I cannot save my demonstration, then a synthetic proposition a priori from dogmatic principles is to be reckoned to the score of my opponent, then also I will deem my impeachment of ordinary metaphysics as unjust, and pledge myself to recognize his stricture on my Critique as justified (although this would not be the consequence by a long way). To this end it would be necessary, it seems to me, that he should step out of his incognito. Otherwise I do not see how it could be avoided, that instead of dealing with one, I should be honored by several problems coming from anonymous and unqualified opponents.

Proposals As To An Investigation Of The Critique Upon Which A Judgment May Follow.

I feel obliged to the honored public even for the silence with which it for a long time favored my Critique, for this proves at least a postponement of judgment, and some supposition that in a work, leaving all beaten tracks and striking out on a new path, in which one cannot at once perhaps so easily find one's way, something may perchance lie, from which an important

but at present dead branch of human knowledge may derive new life and productiveness. Hence may have originated a solicitude for the as yet tender shoot, lest it be destroyed by a hasty judgment. A test of a judgment, delayed for the above reasons, is now before my eye in the Gothaischen gelehrten Zeitung, the thoroughness of which every reader will himself perceive, from the clear and unperverted presentation of a fragment of one of the first principles of my work, without taking into consideration my own suspicious praise.

And now I propose, since an extensive structure cannot be judged of as a whole from a hurried glance, to test it piece by piece from its foundations, so thereby the present Prolegomena may fitly be used as a general outline with which the work itself may occasionally be compared. This notion, if it were founded on nothing more than my conceit of importance, such as vanity commonly attributes to one's own productions, would be immodest and would deserve to be repudiated with disgust. But now, the interests of speculative philosophy have arrived at the point of total extinction, while human reason hangs upon them with inextinguishable affection, and only after having been ceaselessly deceived does it vainly attempt to change this into indifference.

In our thinking age it is not to be supposed but that many deserving men would use any good opportunity of working for the common interest of the more and more enlightened reason, if there were only some hope of attaining the goal. Mathematics, natural science, laws, arts, even morality, etc., do not completely fill the soul; there is always a space left over, reserved for pure and speculative reason, the vacuity of which prompts us to seek in vagaries, buffooneries, and mysticism for what seems to be employment and entertainment, but what actually is mere pastime; in order to deaden the troublesome voice of reason, which in accordance with its nature requires something that can satisfy it, and not merely subserve other ends or the interests of our inclinations. A consideration, therefore, which is concerned only with reason as it exists for it itself, has as I may reasonably suppose a great fascination for every one who has attempted thus to extend his conceptions, and I may even say a greater than any other theoretical branch of knowledge, for which he would not willingly exchange it, because here all other cognitions, and even purposes, must meet and unite themselves in a whole.45

I offer, therefore, these Prolegomena as a sketch and text-book for this investigation, and not the work itself. Although I am even now perfectly satisfied with the latter as far as contents, order, and mode of presentation, and the care that I have expended in weighing and testing every sentence before writing it down, are concerned (for it has taken me years to satisfy myself fully, not only as regards the whole but in some cases even as to the sources of one particular proposition); yet I am not quite satisfied with my exposition in some sections of the doctrine of elements, as for instance in the deduction of the conceptions of the Understanding, or in that on the paralogisms of pure reason, because a certain diffuseness takes away from their clearness, and in place of them, what is here said in the Prolegomena respecting these sections, may be made the basis of the test.

It is the boast of the Germans that where steady and

continuous industry are requisite, they can carry things farther than other nations. If this opinion be well founded, an opportunity, a business, presents itself, the successful issue of which we can scarcely doubt, and in which all thinking men can equally take part, though they have hitherto been unsuccessful in accomplishing it and in thus confirming the above good opinion. But this is chiefly because the science in question is of so peculiar a kind, that it can be at once brought to completion and to that enduring state that it will never be able to be brought in the least degree farther or increased by later discoveries, or even changed (leaving here out of account adornment by greater clearness in some places, or additional uses), and this is an advantage no other science has or can have, because there is none so fully isolated and independent of others, and which is concerned with the faculty of cognition pure and simple. And the present moment seems, moreover, not to be unfavorable to my expectation, for just now, in Germany, no one seems to know wherewith to occupy himself, apart from the so-called useful sciences, so as to pursue not mere play, but a business possessing an enduring purpose.

To discover the means how the endeavors of the learned may be united in such a purpose, I must leave to others. In the meantime, it is my intention to persuade any one merely to follow my propositions, or even to flatter me with the hope that he will do so; but attacks, repetitions, limitations, or confirmation, completion, and extension, as the case may be, should be appended. If the matter be but investigated from its foundation, it cannot fail that a system, albeit not my own, shall be erected, that shall be a possession for future generations for which they may have reason to be grateful.

It would lead us too far here to show what kind of metaphysics may be expected, when only the principles of criticism have been perfected, and how, because the old false feathers have been pulled out, she need by no means appear poor and reduced to an insignificant figure, but may be in other respects richly and respectably adorned. But other and great uses which would result from such a reform, strike one immediately. The ordinary metaphysics had its uses, in that it sought out the elementary conceptions of the pure understanding in order to make them clear through analysis, and definite by explanation. In this way it was a training for reason, in whatever direction it might be turned; but this was all the good it did; service was subsequently effaced when it favored conceit by venturesome assertions, sophistry by subtle distinctions and adornment, and shallowness by the ease with which it decided the most difficult problems by means of a little school-wisdom, which is only the more seductive the more it has the choice, on the one hand, of taking something from the language of science, and on the other from that of popular discourse, thus being everything to everybody, but in reality nothing at all. By criticism, however, a standard is given to our judgment, whereby knowledge may be with certainty distinguished from pseudo-science, and firmly founded, being brought into full operation in metaphysics; a mode of thought extending by degrees its beneficial influence over every other use of reason, at once infusing into it the true philosophical spirit. But the service also that metaphysics performs for theology, by making it independent of the judgment of dogmatic speculation, thereby assuring it completely against the attacks of all such opponents, is certainly not to be valued

lightly. For ordinary metaphysics, although it promised the latter much advantage, could not keep this promise, and moreover, by summoning speculative dogmatics to its assistance, did nothing but arm enemies against itself. Mysticism, which can prosper in a rationalistic age only when it hides itself behind a system of school-metaphysics, under the protection of which it may venture to rave with a semblance of rationality, is driven from this, its last hiding-place, by critical philosophy. Last, but not least, it cannot be otherwise than important to a teacher of metaphysics, to be able to say with universal assent, that what he expounds is Science, and that thereby genuine services will be rendered to the commonweal.

2 Says Horace:
" Rusticus expectat, dum defluat amnis, at ille
Labitur et labetur in omne volubilis aevum;
" A rustic fellow waiteth on the shore
For the river to flow away,
But the river flows, and flows on as before,
And it flows forever and aye."

3 Nevertheless Hume called this very destructive science metaphysics and attached to it great value. "Metaphysics and morals" he declares "are the most important branches of science; mathematics and physics are not nearly so important" ["On the Rise and Progress of Arts and Sciences," Essays, Moral, Political, and Literary]. But the acute man merely regarded the negative use arising from the moderation of extravagant claims of speculative reason, and the complete settlement of the many endless and troublesome controversies that mislead mankind. He overlooked the positive injury which results, if reason be deprived of its most important prospects, which can alone supply to the will the highest aim for all its endeavor.

4 [The term Anschauung here used means sense-perception. It is that which is given to the senses and apprehended Immediately, as an object is seen by merely looking at it. The translation intuiition, though etymologically correct, is misleading. In the

present passage the term is not used in its technical significance but means " practical experience."-Ed.]

5 [The term apodictic is borrowed by Kant from Aristotle who uses it in the sense of "certain beyond dispute." The word is derived from [Greek] (= I show) and is contrasted to dialectic propositions, i. e., such statements " admit of controversy. --Ed.]

6 It is unavoidable that as knowledge advances, certain expressions which have become classical, after having been used since the infancy: of science, will be found inadequate and unsuitable, and a newer and more appropriate application of the terms will give rise to confusion. . [This is the case with the term " analytical."] The analytical method, so far as it is opposed to the synthetical, is very different from that which

constitutes the essence of analytical propositions: it signifies only that we start from what is sought, as if it were given, and ascend to the only conditions under which it is possible. In this method we often use nothing but synthetical propositions, as in mathematical analysis, and it were better to term it the regressive method, in contradistinction to the synthetic or progressive. A principal part of Logic too is distinguished by the name of Analytics, which here signifies the logic of truth in contrast to Dialectics, without considering whether the cognitions belonging to it are analytical or synthetical.

7 [This whole paragraph (Sect. 9) will be better understood when compared with Remark I., following this section. - Ed.]

8 [Empirical judgments (emfiirische Urtheile) are either mere statements of fact, viz.. records of a perception, or statements of a natural law, implying a causal connection between two facts. The former Kant calls" judgments of perception" (Wahrnehmungsurtheile), the latter "judgments of experience " (Erfahrungsurtheile).-Ed.]

9 I freely grant that these examples do not represent such judgments of perception as ever could become judgments of experience, even though a concept of the understanding were superadded, because they refer merely to feeling, which everybody knows to be merely subjective, and which of course can never be attributed to the object, and consequently never become objective. I only wished to give here an example of a judgment that is merely subjectively valid, containing no ground for universal validity, and thereby for a relation to the object. An example of the judgments of perception, which become judgments of experience by superadded concepts of the understanding, will be given in the next note.

10 As an easier example, we may take the following: " When the sun shines on the stone, it grows warm." This judgment, however often I and others may have perceived it, is a mere judgment of perception, and contains no necessity; perceptions are only usually conjoined in this manner. But if I say, "The sun warms the stone," I add to the perception a concept of the understanding, viz., that of cause, which connects with the concept of sunshine that of heat as a necessary consequence, and the synthetical judgment becomes of necessity universally valid, viz., objective, and is converted from a perception into experience.

11 This name seems preferable to the term particularia, which is used for these judgments in logic. For the latter implies the idea that they are not universal. But when I start from unity (in single judgments) and so proceed to universality, I must not [even indirectly and negatively] imply any reference to universality. I think plurality merely without universality, and not the exception from universality. This is necessary, if logical considerations shall form the basis of the pure concepts of the understanding. However, there is no need of making changes in logic.

12 But how does this proposition, 11 that judgments of experience contain necessity in the synthesis of perceptions," agree with my statement so often before inculcated, that "experience as cognition a posteriori can afford contingent judgments only? "When I say that experience teaches me something, I mean only the perception that lies in experience,-for example, that heat always follows the shining of the sun on a stone; consequently the proposition of experience is always so far accidental. That this heat necessarily follows the shining of the sun is contained indeed in the judgment of experience (by means of the concept of

cause), yet is a fact not learned by experience; for conversely, experience is first of all generated by this addition of the concept of the understanding (of cause) to perception. How perception attains this addition may be seen by referring in the Critique itself to the section on the Transcendental faculty of Judgment Lviz-, in the first edition, Vex dem Schematismxs der Taxes Verstandsbegrirel.
13 [Kant uses the term physiological in its etymological meaning as "pertaining to the science of physics," i.e., nature in general, not as we use the term now as "pertaining to the functions of the living body." Accordingly it has been translated "physical." -- Ed.]
14 The three following paragraphs will hardly be understood unless reference be made to what the Citique itself says on the subject of the Principles; they will, however, be of service in giving a general view of the Principles, and in fixing the attention of the main points.
15 [Kant uses here the equivocal term Wechsetwirkung. --Ed.]
16 Heat and light are in a small space just as large as to degree as in a large one; in like manner the internal representations, pain, consciousness in general, whether they last a short or a long time, need not vary as to the degree. Hence the quantity is here in a point and in a moment just as great as in any space or time however great. Degrees are therefore capable of increase, but not in intuition, rather in mere sensation (or the quantity of the degree of an intuition). Hence they can only be estimated quantitatively by the relation of 1 to 0, viz, by their capability of decreasing by infinite intermediate degrees to disappearance, or of increasing from naught through infinite gradations to a determinate sensation in a certain time. Quantitas qualitatis est gradus [i.e., the degrees of quality must be measured by equality.]
17 We speak of the "intelligible world," not (as the usual expression is) "intellectual world." For cognitions are intellectual through the understanding, and refer to our world of sense also; but objects, so far as they can be represented merely by the understanding, and to which none of our sensible intuitions can refer, are termed " intelligible." But as some possible intuition must correspond to every object, we would have to assume an understanding that intuits things immediately; but of such we have not the least notion, nor have we of the things of the understanding [Verstandes wasen], to which it should be applied.
18 Crusius alone thought of a compromise: that a Spirit, who can neither err nor deceive, implanted these laws in us originally. But since false principles often intrude themselves, as indeed the very system of this man shows in not a few examples, we are involved ill difficulties as to the use of such a principle in the absence of sure criteria to distinguish the genuine origin from the spurious as we never can know certainly what the Spirit of truth or the father of lies may have instilled into us.
19 The definition of nature is given in the beginning of the Second Part of the " Transcendental Problem," in Sect. 14.

22 See the two tables in the chapters Von den Paralogismen der reinen Verunft and the first division of the Antinomy of Pure Reason, System der kosmologischen Ideen.
23 On the table of the categories many neat observations may be made, for instance (1) that the third arises from the first and

the second joined in one concept (2) that in those of Quantity and of Quality there is merely a progress from unity to totality or from something to nothing (for this purpose the categories of Quality must stand thus: reality, limitation, total negation), without correlata or opposita, whereas those of Relation and of Modality have them; (3) that, as in Logic categorical judgments are the basis of all others, so the category of Substance is the basis of all concepts of actual things; (4) that as Modality in the judgment is not a particular predicate, so by the modal concepts a determination is not superadded to things, etc., etc. Such observations are of great use. If we besides enumerate all the predicables, which we can find pretty completely in any good ontology (for example, Baumgarten's), and arrange them in classes under the categories, in which operation we must not neglect to add as complete a dissection of all these concepts as possible, there will then arise a merely analytical part of metaphysics, which does not contain a single synthetical proposition. which might precede the second (the synthetical), and would by its precision and completeness be not only useful, but, in virtue of its system, be even to some extent elegant.

24 See Critique of Pure Reason, Von der Amphibolie der Reflexbergriffe.

25 If we can say, that a science is actual at least in the idea of all men, as soon as it appears that the problems which lead to it are proposed to everybody by the nature of human reason, and that therefore many (though faulty) endeavors are unavoidably made in its behalf, then we are bound to Fay that metaphysics is subjectively (and indeed necessarily) actual, and therefore we justly ask, how is it (objectively) possible.

26 In disjunctive judgments we consider all possibility as divided in respect to a particular concept. By the ontological principle of the universal determination of a thing in general, I understand the principle that either the one or the other of all possible contradictory predicates must be assigned to any object. This is at the same time the principle of all disjunctive judgments, constituting the foundation of our conception of possibility, and in it the possibility of every object in general is considered as determined. This may serve as a slight explanation of the above proposition: that the activity of reason in disjunctive syllogisms is formally the same as that by which it fashions the idea of a universal conception of all reality, containing in itself that which is positive in all contradictory predicates.

27 See Critique of Pure Reason, Von ded Paralogismen der reinen Verunft.

28 Were the representation of the apperception (the Ego) a concept, by which anything could be thought, it could be used as a predicate 'of other things or contain predicates in itself. But it is nothing more than the feeling of an existence without the least definite conception and is only the representation of that to which all thinking stands in relation (relative accidentis).

29 Cf. Critique, Von den Analogien der Erfahrung.

30 It is indeed very remarkable how carelessly metaphysicians have always passed over the principle of the permanents of substances without ever attempting a proof of it; doubtless because they found themselves abandoned by all proofs as soon as they began to deal with the concept of substance. Common sense, which felt distinctly that without this presupposition no union of perceptions in experience is possible, supplied the want by a postulate. From experience itself it never could derive such a principle, partly because substances cannot be so traced in all

their alterations and dissolutions, that the matter can always be found undiminished, partly because the principle contains Necessity. which is always the sign of an a priori principle. People then boldly applied this postulate to the concept of soul as a substance, and concluded a necessary continuance of the soul after the death of man (especially as the simplicity of this substance, which is interred from the indivisibility of consciousness, secured it from destruction by dissolution). Had they found the genuine source of this principles discovery which requires deeper researches than they were ever inclined to make -- they would have seen, that the law of the permanence of substances has place for the purposes of experience only, and hence can hold good of things so far as they are to be known and conjoined with others in experience, but never independently of all possible experience, and consequently cannot hold good of the soul after death.
31 Cf. Critique, Die antinomie der reinen Vernunft.
32 I therefore would be pleased to have the critical reader to devote to this antinomy of pure reason his chief attention, because nature itself seems to have established it with a view to stagger reason in its daring pretensions, and to force it to self-examination. For every proof, which I have given, as well of the thesis as of the antithesis, I undertake to be responsible, and thereby to show the certainty of the inevitable antinomy of reason. When the reader is brought by this curious phenomenon to fall back upon the proof of the presumption upon which it rests, he will feet himself obliged to investigate the ultimate foundation of all the cognition of pure reason with me more thoroughly.
33 The idea of freedom occurs only in the relation of the intellectual, as cause, to the appearance, as effect. Hence we cannot attribute freedom to matter in regard to the incessant action by which it fills its space. though this action takes place from an internal principle. We dan likewise find no notion of freedom suitable to purely rational beings, for instance, to God, so far as his action is immanent. For his action, though independent of external determining causes, is determined in his eternal reason, that is, in the divine nature. It is only, if something, is to start by an action, and so the effect occurs in the sequence of time, or in the world of sense (e.g., the beginning of the world), that we can put the question, whether the causality of the cause must in its turn have been started, or whether the cause can originate an effect without its causality itself beginning. In the former case the concept of this causality is a concept of natural necessity, in the latter, that of freedom. From this the reader will see. that, as I explained freedom to be the faculty of starting an event spontaneously, I have exactly hit the notion which is the problem of metaphysics.
34 Cf. Critique, the chapter on "Transcendental Ideals."
35 Herr Platner in his Aphorisms acutely says (Sects. 728, 729), "If reason be a criterion, no concept, which is incomprehensible to human reason, can be possible. Incomprehensibility has place in what is actual only. Here incomprehensibility arises from the insufficiency of the acquired ideas." It sounds paradoxical, but is otherwise not strange to say, that in nature there is much incomprehensible (e.g., the faculty of generation) but if we mount still higher, and even go beyond nature, everything again becomes comprehensible; for we then quit entirely the objects, which can be given us, and occupy ourselves merely about ideas, in which occupation we can easily comprehend the law that reason prescribes by them to the understanding for its use in

experience, because the law is the reason's own production.
36 Der die Gegenstande anschaute.
37 [The use of the word "world" without article, though odd, seems to be the correct reading, but it may be a mere misprint. -- Ed.]
38 There is, e.g., an analogy between the juridical relation of human actions and the mechanical relation of motive powers. I never can do anything to an. other man without giving him a right to do the same to me on the same conditions; just as no mass can act with its motive power on another mass without thereby occasioning the other to react equally against it. Here right and motive power are quite dissimilar things, but in their relation there is complete similarity. By means of such an analogy I can obtain a notion of the relation of things which absolutely are unknown to me. For instance, as the promotion of the welfare of children (= a) is to the love of parents (= b), so the welfare of the human species (= c) is to that unknown [quantity which is] in God (= x), which we call love; not as if it had the least similarity to any human inclination, but because we can suppose its relation to the world to be similar to that which things of the world bear one another. But the concept of relation in this case is a mere category, viz., the concept of cause, which has nothing to do with sensibility.
39 I may say, that the causality of the Supreme Cause holds the same place with regard to the world that human reason does with regard to its works of art. Here the nature of the Supreme Cause itself remains unknown to me: I only compare its effects (the order of the world) which I know, and their conformity to reason, to the effects of human reason which I also know; and hence I term the former reason, without attributing to it on that account what I understand in man by this term, or attaching to it anything else known to me, as its property.
40 Critique Pure Reason, II., chap. 3, section 7.
41 Throughout in the Critique I never lost sight of the plan not to neglect anything, were it ever so recondite, that could render the inquiry into the nature of pure reason complete. Everybody may afterwards carry his researches as far as he pleases, when he has been merely shown what yet remains to be done. It is this a duty which must reasonably be expected of him who has made it his business to survey the whole field, in order to consign it to others for future cultivation and allotment. And to this branch both the scholia belong, which will hardly recommend themselves by their dryness to amateurs, and hence are added here for connoisseurs only.
42 By no means "higher." High towers, and metaphysically-great man resembling them, round both of which there is commonly much wind, are not for me. My place is the fruitful bathos, the bottom-land, of experience; and the word transcendental, the meaning of which is so often explained by me but not once grasped by my reviewer (so carelessly has he regarded everything), does not signify something passing beyond all experience, but some. thing that indeed precedes it a priori, but that is intended simply to make cognition of experience possible. If these conceptions overstep experience, their employment is termed transcendent, a word which must be distinguished from transcendental, the latter being limited to the immanent use, that is, to experience. All misunderstandings of this kind have been sufficiently guarded against in the work itself, but my reviewer found his advantage in misunderstanding me.
43 Idealism proper always has a mystical tendency, and can have no other, but mine is solely designed for the purpose of

comprehending the possibility of our cognition a priori as to objects of experience, which is a problem never hitherto solved or even suggested. In this way all mystical idealism falls to the ground, for (as may be seen already in Plato) it inferred from our cognitions a priori (even from those of geometry) another intuition different from that of the senses (namely, an intellectual intuition), because it never occurred to any one that the senses themselves might intuit a priori.

44 The reviewer often fights with his own shadow. When I oppose the truth of experience to dream, he never thinks that I am here speaking simply of the well-known somnio objective sumto of the Wolffian philosophy, which is merely formal, and with which the distinction between sleeping and waking is in no way concerned, and in a transcendental philosophy indeed can have no place. For the rest, he calls my deduction of the categories and table of the principles of the understanding," common well-known axioms of logic and ontology, expressed in an idealistic manner." The reader need only consult these Prolegomena upon this point, to convince himself that a more miserable and historically incorrect, judgment, could hardly be made.

45 [Kant rewrote these sections in the second edition of the Critique.]

The Monadology

Gottfried Leibniz

1714

---

1. The monad, of which we will speak here, is nothing else than a simple substance, which goes to make up composites; by simple, we mean without parts.

2. There must be simple substances because there are composites; for a composite is nothing else than a collection or *aggregatum* of simple substances.

3. Now, where there are no constituent parts there is possible neither extension, nor form, nor divisibility. These monads are the true atoms of nature, and, in fact, the elements of things.

4. Their dissolution, therefore, is not to be feared and there is no way conceivable by which a simple substance can perish through natural means.

5. For the same reason there is no way conceivable by which a simple substance might, through natural means, come into existence, since it can not be formed by composition.

6. We may say then, that the existence of monads can begin or end only all at once, that is to say, the monad can begin only through creation and end only through annihilation. Composites, however, begin or end gradually.

7. There is also no way of explaining how a monad can be altered or changed in its inner being by any other created thing, since there is no possibility of transposition within it, nor can we conceive of any internal movement which can be produced, directed, increased or diminished there within the substance, such as can take place in the case of composites where a change can occur among the parts. The monads have no windows through which anything may come in or go out. The Attributes are not liable to detach themselves and make an excursion outside the substance, as could *sensible species* of the Schoolmen. In the same way neither substance nor attribute can enter from without into a monad.

8. Still monads need to have some qualities, otherwise they would not even be existences. And if simple substances did not differ at all in their qualities, there would be no means of perceiving any change in things. Whatever is in a composite can come into it only through its simple elements and the monads, if they were without qualities (since they do not differ at all in quantity) would be indistinguishable one from another. For instance, if we imagine *a plenum* or completely filled space, where each part receives only the equivalent of its own previous motion, one state of things would not be distinguishable from another.

9. Each monad, indeed, must be different from every other monad. For there are never in nature two beings which are exactly alike, and in which it is not possible to find a difference either internal or based on an intrinsic property.

10. I assume it as admitted that every created being, and consequently the created monad, is subject to change, and indeed that this change is continuous in each.

11. It follows from what has just been said, that the natural changes of the monad come from an internal principle, because an external cause can have no influence on its inner being.

12. Now besides this principle of change there must also be in the monad a variety which changes. This variety constitutes, so to speak, the specific nature and the variety of the simple substances.

13. This variety must involve a multiplicity in the unity or in that which is simple. For since every natural change takes place by degrees, there must be something which changes and something which remains unchanged, and consequently there must be in the simple substance a plurality of conditions and relations, even though it has no parts.

14. The passing condition which involves and represents a multiplicity in the unity, or in the simple substance, is nothing else than what is called *perception*. This should be carefully distinguished from apperception or consciousness, as will appear in what follows. In this matter the Cartesians have fallen into a serious error, in that they deny the existence of those perceptions of which we are not conscious. It is this also which has led them to believe that spirits alone are monads and that there are no souls of animals or other entelechies, and it has led them to make the common confusion between a protracted period of unconsciousness and actual death. They have thus adopted the Scholastic error that souls can exist entirely separated from bodies, and have even confirmed ill-balanced minds in the belief that souls are mortal.

15. The action of the internal principle which brings about the change or the passing from one perception to another may be called appetition. It is true that the desire (*l'appetit*) is not always able to attain to the whole of the perception which it strives for, but it always attains a portion of it and reaches new perceptions.

16. We, ourselves, experience a multiplicity in a simple substance, when we find that the most trifling thought of which we are conscious involves a variety in the object. Therefore all those who acknowledge that the soul is a simple substance ought to grant this multiplicity in the monad, and Monsieur Bayle should have found no difficulty in it, as he has done in his *Dictionary*, article "Rorarius."

17. It must be confessed, however, that perception, and that which depends upon it, are inexplicable by mechanical causes, that is to say, by figures and motions. Supposing that there were a machine whose structure produced thought, sensation, and perception, we could conceive of it as increased in size with the same proportions until one was able to enter into its interior, as he would into a mill. Now, on going into it he would find only pieces working upon one another, but never would he find anything to explain perception. It is accordingly in the simple substance, and not in the composite nor in a machine that the perception is to be sought. Furthermore, there is nothing besides perceptions and their changes to be found in the simple substance. And it is in these alone that all the internal activities of the simple substance can consist.

18. All simple substances or created monads may be called entelechies, because they have in themselves a certain perfection. There is in them a sufficiency which makes them the source of their internal activities, and renders them, so to speak, incorporeal Automatons.

19. If we wish to designate as soul everything which has perceptions and desires in the general sense that I have just explained, all simple substances or created monads could be called souls. But since feeling is something more than a mere perception I think that the general name of monad or entelechy should suffice for simple substances which have only perception, while we may reserve the term Soul for those whose perception is more distinct and is accompanied by memory.

20. We experience in ourselves a state where we remember nothing and where we have no distinct perception, as in periods of fainting, or when we are overcome by a profound, dreamless sleep. In such a state the soul does not sensibly differ at all from a simple monad. As this state, however, is not permanent and the soul can recover from it, the soul is something more.

21. Nevertheless it does not follow at all that the simple substance is in such a state without perception. This is so because of the reasons given above; for it cannot perish, nor on the other hand would it exist without some affection and the affection is nothing else than its perception. When, however, there are a great number of weak perceptions where nothing stands out distinctively, we are stunned; as when one turns around and around in the same direction, a dizziness comes on, which makes him swoon and makes him able to distinguish nothing. Among animals, death can occasion this state for quite a period.

22. Every present state of a simple substance is a natural consequence of its preceding state, in such a way that its present is big with its future.

23. Therefore, since on awakening after a period of unconsciousness we become conscious of our perceptions, we must, without having been conscious of them, have had perceptions immediately before; for one perception can come in a natural way only from .another perception, just as a motion can come in a natural way only from a motion.

24. It is evident from this that if we were to have nothing distinctive, or so to speak prominent, and of a higher flavor in our perceptions, we should be in a continual state of stupor. This is the condition of monads which are wholly bare.

25. We see that nature has given to animals heightened perception, s, having provided them with organs which collect numerous rays of light or numerous waves of air and thus make them more effective in their combination. Something similar to this takes place in the case of smell, in that of taste and of touch, and perhaps in many other senses which are unknown to us. I shall have occasion very soon to explain how that which occurs in the soul represents that which goes on in the sense organs.

26. The memory furnishes a sort of consecutiveness which imitates reason but is to be distinguished from it. We see that animals when they have the perception of something which they notice and. of which they have had a similar previous perception, are led by the representation of their memory to expect that which was associated in the preceding perception, and they come to have feelings like those which they had before. For instance, if a stick be shown to a dog, he remembers the pain which it has caused him and he whines or runs away.

27. The vividness of the picture, which comes to him or moves him, is derived either from the magnitude or from the number of the previous perceptions. For, oftentimes, a strong impression brings about, all at once, the same effect as a long-continued habit or as a great many reiterated, moderate perceptions.

28. Men act in like manner as animals, in so far as the sequence of their perceptions is determined only by the law of memory, resembling the *empirical physicians* who practice simply, without any

theory, and we are empiricists in three-fourths of our actions. For instance, when we expect that there will be daylight tomorrow, we do so empirically, because it has always happened so up to the present time. It is only the astronomer who uses his reason in making such an affirmation.

29. But the knowledge of eternal and necessary truths is that which distinguishes us from mere animals and gives us reason and the sciences, thus raising us to a knowledge of ourselves and of God. This is what is called in us the Rational Soul or the Mind.

30. It is also through the knowledge of necessary truths and through abstractions from them that we come to perform Reflective Acts, which cause us to think of what is called the I, and to decide that this or that is within us. it is thus, that in thinking upon ourselves we think of *being*, of *substance*, of the *simple* and *composite*, of a *material* thing and of *God* himself, conceiving that what is limited in us is in him without limits. These reflective acts furnish the principal objects of our reasonings.

31. Our reasoning is based upon two great principles: first, that of contradiction, by means of which we decide that to be false which involves contradiction and that to be true which contradicts or is opposed to the false.

32. And second, the principle of sufficient reason, in virtue of which we believe that no fact can be real or existing and no statement true unless it has a sufficient reason why it should be thus and not otherwise. Most frequently, however, these reasons cannot be known by us.

33. There are also two kinds of truths: those of reasoning and those of fact. The truths of reasoning are necessary, and their opposite is impossible. Those of fact, however, are contingent, and their opposite is possible. When a truth is necessary, the reason can be found by analysis in resolving it into simpler ideas and into simpler truths until we reach those which are primary.

34. It is thus that with mathematicians the speculative theorems and the practical canons are reduced by analysis to definitions, axioms, and postulates.

35. There are finally simple ideas of which no definition can be given. There are also the axioms and postulates or, in a word, the primary principles which cannot be proved and, indeed, have no need of proof. These are identical propositions whose opposites involve express contradictions.

36. But there must be also a sufficient reason for contingent truths or truths of fact; that is to say, for the sequence of the things which extend throughout the universe of created beings, where the analysis into more particular reasons can be continued into greater detail without limit because of the immense variety of the things in nature and because of the infinite division of bodies. There is an infinity of figures and of movements, present and past, which enter into the efficient cause of my present writing, and in its final cause there are an infinity of slight tendencies and dispositions of my soul, present and past.

37. And as all this detail again involves other and more detailed contingencies, each of which again has need of a similar analysis in order to find its explanation, no real advance has been made. Therefore, the sufficient or ultimate reason must needs be outside of the sequence or series of these details of contingencies, however infinite they may be.

38. It is thus that the ultimate reason for things must be a necessary substance, in which the detail of the changes shall be present merely potentially, as in the fountainhead, and this substance we call God.

39. Now, since this substance is a sufficient reason for all the above mentioned details, which are linked together throughout, *there is but one God, and this God is sufficient*.

40. We may hold that the supreme substance, which is unique, universal and necessary with nothing independent outside of it, which is further a pure sequence of possible being, must be incapable of limitation and must contain as much reality as possible.

41. Whence it follows that God is absolutely perfect, perfection being understood as the magnitude of positive reality in the strict sense, when the limitations or the bounds of those things which have them are removed. There where there are no limits, that is to say, in God, perfection is absolutely infinite.

42. It follows also that created things derive their perfections through the influence of God, but their imperfections come from their own natures, which cannot exist without limits. It is in this latter that they are distinguished from God. An example of this original imperfection of created things is to be found in the natural inertia of bodies.

43. It is true, furthermore, that in God is found not only the source of existences, but also that of essences, in so far as they are real. In other words, he is the source of whatever there is real in the possible. This is because the Understanding of God is in the region of eternal truths or of the ideas upon which they depend, and because without him there would be nothing real in the possibilities of things, and not only would nothing be existent, nothing would be even possible.

44. For it must needs be that if there is a reality in essences or in possibilities or indeed in the eternal 'truths, this reality is based upon something existent and actual, and, consequently, in the existence of the necessary Being in whom essence includes existence or in whom possibility is sufficient to produce actuality.

45. Therefore God alone (or the Necessary Being) has this prerogative that if he be possible he must necessarily exist, and, as nothing is able to prevent the possibility of that which involves no bounds, no negation and consequently, no contradiction, this alone is sufficient to establish *a priori* his existence. We have, therefore, proved his existence through the reality of eternal truths. But a little while ago we also proved it *a posteriori,* because contingent beings exist which can have their ultimate and sufficient reason only in the necessary being which, in turn, has the reason for existence in itself.

46. Yet we must not think that the eternal truths being dependent upon God are therefore arbitrary and depend upon his will, as Descartes seems to have held, and after him M. Poiret. This is the case only with contingent truths which depend upon fitness or the choice of the greatest good; necessarily truths on the other hand depend solely upon his understanding and are the inner objects of it.

47. God alone is the ultimate unity or the original simple substance, of which all created or derivative monads are the products, and arise, so to speak, through the continual outflashings (fulgurations) of the divinity from moment to moment, limited by the receptivity of the creature to whom limitation is an essential.

48. In God are present: power, which is the source of everything; knowledge, which contains the details of the ideas; and, finally, will, which changes or produces things in accordance with the principle of the greatest good. To these correspond in the created monad, the subject or basis, the faculty of perception, and the faculty of appetition. In God these attributes are absolutely infinite or perfect, while in the created monads or in the entelechies (*perfectihabies*, as Hermolaus Barbarus translates this word), they are imitations approaching him in proportion to the perfection.

49. A created thing is said to act outwardly in so far as it has perfection, and to be acted upon by another in so far as it is imperfect. Thus action is attributed to the monad in so far as it has distinct perceptions, and passion or passivity is attributed in so far as it has confused perceptions.

50. One created thing is more perfect than another when we find in the first that which gives an *a priori* reason for what occurs in the second. This why we say that one acts upon the other.

51. In the case of simple substances, the influence which one monad has upon another is only ideal. It can have its effect only through the mediation of God, in so far as in the ideas of God each monad can rightly demand that God, in regulating the others from the beginning of things, should have regarded it also. For since one created monad cannot have a physical influence upon the inner being of another, it is only through the primal regulation that one can have dependence upon another.

52. It is thus that among created things action and passivity are reciprocal. For God, in comparing two simple substances, finds in each one reasons obliging him to adapt the other to it; and consequently what is active in certain respects is passive from another point of view, active in so far as what we distinctly know in it serves to give a reason for what occurs in another, and passive in so far as the reason for what occurs in it is found in what is distinctly known in another.

53. Now as there are an infinity of possible universes in the ideas of God, and but one of them can exist, there must be a sufficient reason' for the choice of God which determines him to select one rather than another.

54. And this reason is to be found only in the fitness or in the degree of perfection which these worlds possess, each possible thing having the right to claim existence in proportion to the perfection which it involves.

55. This is the cause for the existence of the greatest good; namely, that the wisdom of God permits him to know it, his goodness causes him to choose it, and his power enables him to produce it.

56. Now this interconnection, relationship, or this adaptation of all things to each particular one, and of each one to all the rest, brings it about that every simple substance has relations which express all the others and that it is consequently a perpetual living mirror of the universe.

57. And as the same city regarded from different sides appears entirely different, and is, as it were multiplied respectively, so, because of the infinite number of simple substances, there are a similar infinite number of universes which are, nevertheless, only the aspects of a single one as seen from the special point of view of each monad.

58. Through this means has been obtained the greatest possible variety, together with the greatest order that may be; that is to say, through this means has been obtained the greatest possible perfection.

59. This hypothesis, moreover, which I venture to call demonstrated, is the only one which fittingly gives proper prominence to the greatness of God. M. Bayle recognized this when in his dictionary (article "Rorarius") he raised objections to it; indeed, he was inclined to believe that I attributed too much to God, and more than it is possible to attribute to him: But he was unable to bring forward any reason why this universal harmony which causes every substance to express exactly all others through the relation which it has with them is impossible.

60. Besides, in what has just been said can be seen the *a priori* reasons why things cannot be otherwise than they are. It is because God, in ordering the whole, has had regard to every part and in particular to each monad; and since the monad is by its very *nature representative*, nothing can

limit it to represent merely a part of things. It is nevertheless true that this representation is, as regards the details of the whole universe, only a confused representation, and is distinct only as regards a small part of them, that is to say, as regards those things which are nearest or greatest in relation to each monad. If the representation were distinct as to the details of the entire Universe, each monad would be a Deity. It is not in the object represented that the monads are limited, but in the modifications of their knowledge of the object. In a confused way they reach out to infinity or to the whole, but are limited and differentiated in the degree of their distinct perceptions.

61. In this respect composites are like simple substances, for all space is filled up; therefore, all matter is connected. And in a plenum or filled space every movement has an effect upon bodies in proportion to this distance, so that not only is every body affected by those which are in contact with it and responds in some way to whatever happens to them, but also by means of them the body responds to, those bodies adjoining them, and their intercommunication reaches to any distance whatsoever. Consequently every body responds to all that happens in the universe, so that h e who saw all could read in each one what is happening everywhere, and even what has happened and what will happen. He can discover in the present what is distant both as regards space and as regards time; "all things conspire" as Hippocrates said. A soul can, however, read in itself only what is there represented distinctly. It cannot all at once open up all its folds, because they extend to infinity.

62. Thus although each created monad represents the whole universe, it represents more distinctly the body which specially pertains to it and of which it constitutes the entelechy. And as this body expresses all the universe through the interconnection of all matter in the plenum, the soul also represents the whole universe in representing this body, which belongs to it in a particular way.

63. The body belonging to a monad, which is its entelechy or soul, constitutes together with the entelechy what may be called a *rising being*, and with a soul what is called an *animal*. Now this body of a living being or of an animal is always organic, because every monad is a mirror of the universe is regulated with perfect order there must needs be order also in what represents it, that is to say in the perceptions of the soul and consequently in the body through which the, universe is represented in the soul.

64. Therefore every organic body of a living being is a kind of divine machine or natural automaton, infinitely surpassing all artificial automatons. Because a machine constructed by man's skill is not a machine in each of its parts; for instance, the teeth of a brass wheel have parts or bits which to us are not artificial products and contain nothing in themselves to show the use to which the wheel was destined in the machine. The machines of nature, however, that is to say, living bodies, are still machines in their smallest parts *ad infinitum*. Such is the difference between nature and art, that is to say, between divine art and ours.

65. The author of nature has been able to employ this divine and infinitely marvelous artifice, because each portion of matter is not only, as the ancients recognized, infinitely divisible, but also because it is really divided without end, every part into other parts, each one of which has its own proper motion. Otherwise it would be impossible for each portion of matter to express all the universe.

66. Whence we see that there is a world of created things, of living beings, of animals, of entelechies, of souls, in the minutest particle of matter.

67. Every portion of matter may be conceived as like a garden full of plants and like a pond full of fish. But every branch of a plant, every member of an animal, and every drop of the fluids within

it, is also such a garden or such a pond.

68. And although the ground and air which lies between the plants of the garden, and the water which is between the fish in the pond, are not themselves plants or fish, yet they nevertheless contain these, usually so small however as to be imperceptible to us.

69. There is, therefore, nothing uncultivated, or sterile or dead in the universe, no chaos, no confusion, save in appearance; somewhat as a pond would appear at a distance when we could see in it a confused movement, and so to speak, a swarming of the fish, without however discerning the fish themselves.

70. It is evident, then, that every living body has a dominating entelechy, which in animals is the soul. The parts, however, of this living body are full of other living beings, plants and animals, which in turn have each one its entelechy or dominating soul.

71. This does not mean, as some who have misunderstood my thought have imagined, that each soul has a quantity or portion of matter appropriated to it or attached to itself for ever, and that it consequently owns other inferior living beings destined to serve it always; because all bodies are in a state of perpetual flux like rivers, and the parts are continually entering in or passing out.

72. The soul, therefore, changes its body only gradually and by degrees, so that it is never deprived all at once of all its organs. There is frequently a metamorphosis in animals, but never metempsychosis or a transmigration of souls. Neither are there souls wholly separate from bodies, nor bodiless spirits. God alone is without body.

73. This is also why there is never absolute generation or perfect death in the strict sense, consisting in the separation of the soul from the body. What we call generation is development and growth, and what we call death is envelopment and diminution.

74. Philosophers have been much perplexed in accounting for the origin of forms, entelechies, or souls. Today, however, when it has been learned through careful investigations made in plant, insect and animal life, that the organic bodies of nature are never the product of chaos or putrefaction, but always come from seeds in which there was without doubt some preformation, it has been decided that not only is the organic body already present before conception, but also a soul in this body, in a word, the animal itself; and it has been decided that, by means of conception the animal is merely made ready for a great transformation, so as to become an animal of another sort. We can see cases somewhat similar outside of generation when grubs become flies and caterpillars butterflies.

75. These little animals, some of which by conception become large animals' may be called spermatic. Those among them which remain in their species, that is to say, the greater part, are born, multiply, and are destroyed, like the larger animals. There are only a few chosen ones which come out upon a greater stage.

76. This, however, is only half the truth. I believe, therefore, that if the animal never actually commences by natural means, no more does it by natural means come to an end. Not only is there no generation, but also there is no entire destruction or absolute death. These reasonings, carried on *a posteriori* and drawn from experience, accord perfectly with the principles which I have above deduced *a priori*.

77. Therefore we may say that not only the soul (the mirror of the indestructible universe) is indestructible, but also the animal itself is, although its mechanism is frequently destroyed in parts and although it puts off and takes on organic coatings.

78. These principles have furnished me the means of explaining on natural grounds the union, or rather the conformity between the soul and the organic body. The soul follows its own laws, and the body likewise follows its own laws. They are fitted to each other in virtue of the preestablished harmony between all substances ' since they are all representations of one and the same universe.

79. Souls act in accordance with the laws of final causes through their desires, ends and means. Bodies act in accordance with the laws of efficient causes or of motion. The two realms, that of efficient causes and that of final causes, are in harmony, each with the other.

80. Descartes saw that souls cannot at all impart force to bodies, because there is always the same quantity of force in matter. Yet he thought that the soul could change the direction of bodies. This was, however, because at that time the law of nature which affirms also that conservation of the same total direction in the motion of matter was not known. If he hid known that law, he would have fallen upon my system of preestablished harmony.

81. According to this system bodies act as if (to suppose the impossible) there were no souls at all, and souls act as if there were no bodies, and yet both body and soul act as if the one were influencing the other.

82. Although I find that essentially the same thing is true of all living things and animals, which we have just said (namely, that animals and souls begin from the very commencement of the world and that they no more come to an end than does the world) nevertheless, rational animals have this peculiarity, that their little spermatic animals, as long as they remain such, have only ordinary or sensuous souls, but those of them which are, so to speak, elected, attain by actual conception to human nature, and their sensuous souls are raised to the rank of reason and to the prerogative of spirits.

83. Among the differences that there are between ordinary souls and spirits, some of which I have already instanced, there is also this, that while souls in general are living mirrors or images of the universe of created things, spirits are also images of the Deity himself or of the author of nature. They are capable of knowing the system of the universe, and of imitating some features of it by means of artificial models, each spirit being like a small divinity in its own sphere.

84. Therefore, spirits are able to enter into a sort of social relationship with God, and with respect to them he is not only what an inventor is to his machine (as in his relation to the other created things), but be is also what a prince is to his subjects, and even what a father is to his children.

85. Whence it is easy to conclude that the totality of all spirits must compose the city of God, that is to say, the most perfect state that is possible under the most perfect monarch.

86. This city of God, this truly universal monarchy, is a moral world within the natural world. It is what is noblest and most divine among the works of God. And in it consists in reality the glory of God, because he would have no glory were not his greatness and goodness known and wondered at by spirits. It is also in relation to this divine city that God properly has goodness. His wisdom and his power are shown everywhere.

87. As we established above that there is a perfect harmony between the two natural realms of efficient and final causes, it will be in place here to point out another harmony which appears between the physical realm of nature and the moral realm of grace, that is to say, between God considered as the architect of the mechanism of the world and God considered as the monarch of the divine city of spirits.

88. This harmony brings it about that things progress of themselves toward grace along natural

lines, and that this earth, for example, must be destroyed and restored by natural means at those times when the proper government of spirits demands it, for chastisement in the one case and for a reward in the other.

89. We can say also that God, the Architect, satisfies in all respects God the Law Giver, that therefore sins will bring their own penalty with them through the order of nature, and because of the very structure of things, mechanical though it is. And in the same way the good actions will attain their rewards in mechanical way through their relation to bodies, although this cannot and ought not always to take place without delay.

90. Finally, under this perfect government, there will be no good action unrewarded and no evil action unpunished; everything must turn out for the well-being of the good; that is to say, of those who are not disaffected in this great state, who, after having done their duty, trust in Providence and who love and imitate, as is meet, the Author of all Good, delighting in the contemplation of his perfections according to the nature of that genuine, pure love which finds pleasure in the happiness of those who are loved. It is for this reason that wise and virtuous persons work in behalf of everything which seems conformable to presumptive or antecedent will of God, and are, nevertheless, content with what God actually brings to pass through his secret, consequent and determining will, recognizing that if we were able to understand sufficiently well the order of the universe, we should find that it surpasses all the desires of the wisest of us, and that it is impossible to render it better than it is, not only for all in general, but also for each one of us in particular, provided that we have the proper attachment for the author of all, not only as the Architect and the efficient cause of our being, but also as our Lord and the Final Cause, who ought to be the whole goal of our will, and who alone can make us happy.

The Internet Encyclopedia of Philosophy

The Monadology.
Gottfried Leibniz
1714

* * * *

1. The monad, of which we will speak here, is nothing else than a simple substance, which goes to make up composites; by simple, we mean without parts.

2. There must be simple substances because there are composites; for a composite is nothing else than a collection or <aggregatum> of simple substances.

3. Now, where there are no constituent parts there is possible neither extension, nor form, nor divisibility. These monads are the true atoms of nature, and, in fact, the elements of things.

4. Their dissolution, therefore, is not to be feared and there is no way conceivable by which a simple substance can perish through natural means.

5. For the same reason there is no way conceivable by which a simple substance might, through natural means, come into existence, since it can not be formed by composition.

6. We may say then, that the existence of monads can begin or end only all at once, that is to say, the monad can begin only through creation and end only through annihilation. Composites, however, begin or end gradually.

____

7. There is also no way of explaining how a monad can be altered or changed in its inner being by any other created thing, since there is no possibility of transposition within it, nor can we conceive of any internal movement which can be produced, directed, increased or diminished there within the substance,

such as can take place in the case of composites where a change can occur among the parts. The monads have no windows through which anything may come in or go out. The Attributes are not liable to detach themselves and make an excursion outside the substance, as could <sensible species> of the Schoolmen. In the same way neither substance nor attribute can enter from without into a monad.

8. Still monads need to have some qualities, otherwise they would not even be existences. And if simple substances did not differ at all in their qualities, there would be no means of perceiving any change in things. Whatever is in a composite can come into it only through its simple elements and the monads, if they were without qualities (since they do not differ at all in quantity) would be indistinguishable one from another. For instance, if we imagine <a plenum> or completely filled space, where each part receives only the equivalent of its own previous motion, one state of things would not be distinguishable from another.

9. Each monad, indeed, must be different from every other monad. For there are never in nature two beings which are exactly alike, and in which it is not possible to find a difference either internal or based on an intrinsic property.

10. I assume it as admitted that every created being, and consequently the created monad, is subject to change, and indeed that this change is continuous in each.

11. It follows from what has just been said, that the natural changes of the monad come from an internal principle, because an external cause can have no influence on its inner being.

12. Now besides this principle of change there must also be in the monad a variety which changes. This variety constitutes, so to speak, the specific nature and the variety of the simple substances.

13. This variety must involve a multiplicity in the unity or in that which is simple. For since every natural change takes place by degrees, there must be something which changes and something which remains unchanged, and consequently there must be in the simple substance a plurality of conditions and relations, even though it has no parts.

14. The passing condition which involves and represents a multiplicity in the unity, or in the simple substance, is nothing else than what is called <perception>. This should be carefully distinguished from apperception or consciousness, as will appear in what follows. In this matter the Cartesians have fallen into a serious error, in that they deny the existence of those perceptions of which we are not conscious. It is this also which has led them to believe that spirits alone are monads and that there are no souls of animals or other entelechies, and it has led them to make the common confusion between a protracted period of unconsciousness and actual death. They have thus adopted the Scholastic error that souls can exist entirely separated from bodies, and have even confirmed ill-balanced minds in the belief that souls are mortal.

15. The action of the internal principle which brings about the change or the passing from one perception to another may be called appetition. It is true that the desire (<l'appetit>) is not always able to attain to the whole of the perception which it strives for, but it always attains a portion of it and reaches new perceptions.

16. We, ourselves, experience a multiplicity in a simple substance, when we find that the most trifling thought of which we are conscious involves a variety in the object. Therefore all those who acknowledge that the soul is a simple substance ought to grant this multiplicity in the monad, and Monsieur Bayle should have found no difficulty in it, as he has done in his <Dictionary>, article "Rorarius."

17. It must be confessed, however, that perception, and that which depends upon it, are inexplicable by mechanical causes, that is to say, by figures and motions. Supposing that there were a machine whose structure produced thought, sensation, and perception, we could conceive of it as increased in size with the same proportions until one was able to enter into its interior, as he would into a mill. Now, on going into it he would find only pieces working upon one another, but never would he find anything to explain perception. It is accordingly in the simple substance, and not in the composite nor in a machine that the perception is to be sought. Furthermore, there is nothing besides perceptions and their changes to be found in the simple substance. And it is in these alone that all the internal activities of the simple substance can consist.

18. All simple substances or created monads may be called entelechies, because they have in themselves a certain perfection. There is in them a sufficiency which makes them the source of their internal activities, and renders them, so to speak, incorporeal Automatons.

19. If we wish to designate as soul everything which has perceptions and desires in the general sense that I have just explained, all simple substances or created monads could be called souls. But since feeling is something more than a mere perception I think that the general name of monad or entelechy should suffice for simple substances which have only perception, while we may reserve the term Soul for those whose perception is more distinct and is accompanied by memory.

20. We experience in ourselves a state where we remember nothing and where we have no distinct perception, as in periods of fainting, or when we are overcome by a profound, dreamless sleep. In such a state the soul does not sensibly differ at all from a simple monad. As this state, however, is not permanent and the soul can recover from it, the soul is something more.

21. Nevertheless it does not follow at all that the simple substance is in such a state without perception. This is so because of the reasons given above; for it cannot perish, nor on the other hand would it exist without some affection and the affection is nothing else than its perception. When, however, there are a great number of weak perceptions where nothing stands out distinctively, we are stunned; as when one turns around and around in the same direction, a dizziness comes on, which makes him swoon and makes him able to distinguish nothing. Among

animals, death can occasion this state for quite a period.

22. Every present state of a simple substance is a natural consequence of its preceding state, in such a way that its present is big with its future.

23. Therefore, since on awakening after a period of unconsciousness we become conscious of our perceptions, we must, without having been conscious of them, have had perceptions immediately before; for one perception can come in a natural way only from .another perception, just as a motion can come in a natural way only from a motion.

24. It is evident from this that if we were to have nothing distinctive, or so to speak prominent, and of a higher flavor in our perceptions, we should be in a continual state of stupor. This is the condition of monads which are wholly bare.

25. We see that nature has given to animals heightened perception, s, having provided them with organs which collect numerous rays of light or numerous waves of air and thus make them more effective in their combination. Something similar to this takes place in the case of smell, in that of taste and of touch, and perhaps in many other senses which are unknown to us. I shall have occasion very soon to explain how that which occurs in the soul represents that which goes on in the sense organs.

26. The memory furnishes a sort of consecutiveness which imitates reason but is to be distinguished from it. We see that animals when they have the perception of something which they notice and. of which they have had a similar previous perception, are led by the representation of their memory to expect that which was associated in the preceding perception, and they come to have feelings like those which they had before. For instance, if a stick be shown to a dog, he remembers the pain which it has caused him and he whines or runs away.

27. The vividness of the picture, which comes to him or moves him, is derived either from the magnitude or from the number of the previous perceptions. For, oftentimes, a strong impression brings about, all at once, the same effect as a long-continued habit or as a great many reiterated, moderate perceptions.

28. Men act in like manner as animals, in so far as the sequence of their perceptions is determined only by the law of memory, resembling the <empirical physicians> who practice simply, without any theory, and we are empiricists in three-fourths of our actions. For instance, when we expect that there will be daylight tomorrow, we do so empirically, because it has always happened so up to the present time. It is only the astronomer who uses his reason in making such an affirmation.

29. But the knowledge of eternal and necessary truths is that which distinguishes us from mere animals and gives us reason and the sciences, thus raising us to a knowledge of ourselves and of God. This is what is called in us the Rational Soul or the Mind.

30. It is also through the knowledge of necessary truths and through abstractions from them that we come to perform Reflective

Acts, which cause us to think of what is called the I, and to decide that this or that is within us. it is thus, that in thinking upon ourselves we think of <being>, of <substance>, of the <simple> and <composite>, of a <material> thing and of <God> himself, conceiving that what is limited in us is in him without limits. These reflective acts furnish the principal objects of our reasonings.

31. Our reasoning is based upon two great principles: first, that of contradiction, by means of which we decide that to be false which involves contradiction and that to be true which contradicts or is opposed to the false.

32. And second, the principle of sufficient reason, in virtue of which we believe that no fact can be real or existing and no statement true unless it has a sufficient reason why it should be thus and not otherwise. Most frequently, however, these reasons cannot be known by us.

33. There are also two kinds of truths: those of reasoning and those of fact. The truths of reasoning are necessary, and their opposite is impossible. Those of fact, however, are contingent, and their opposite is possible. When a truth is necessary, the reason can be found by analysis in resolving it into simpler ideas and into simpler truths until we reach those which are primary.

34. It is thus that with mathematicians the speculative theorems and the practical canons are reduced by analysis to definitions, axioms, and postulates.

35. There are finally simple ideas of which no definition can be given. There are also the axioms and postulates or, in a word, the primary principles which cannot be proved and, indeed, have no need of proof. These are identical propositions whose opposites involve express contradictions.

36. But there must be also a sufficient reason for contingent truths or truths of fact; that is to say, for the sequence of the things which extend throughout the universe of created beings, where the analysis into more particular reasons can be continued into greater detail without limit because of the immense variety of the things in nature and because of the infinite division of bodies. There is an infinity of figures and of movements, present and past, which enter into the efficient cause of my present writing, and in its final cause there are an infinity of slight tendencies and dispositions of my soul, present and past.

37. And as all this detail again involves other and more detailed contingencies, each of which again has need of a similar analysis in order to find its explanation, no real advance has been made. Therefore, the sufficient or ultimate reason must needs be outside of the sequence or series of these details of contingencies, however infinite they may be.

38. It is thus that the ultimate reason for things must be a necessary substance, in which the detail of the changes shall be present merely potentially, as in the fountainhead, and this substance we call God.

39. Now, since this substance is a sufficient reason for all the above mentioned details, which are linked together throughout, <there is but one God>, <and this God is sufficient>.

40. We may hold that the supreme substance, which is unique, universal and necessary with nothing independent outside of it, which is further a pure sequence of possible being, must be incapable of limitation and must contain as much reality as possible.

41. Whence it follows that God is absolutely perfect, perfection being understood as the magnitude of positive reality in the strict sense, when the limitations or the bounds of those things which have them are removed. There where there are no limits, that is to say, in God, perfection is absolutely infinite.

42. It follows also that created things derive their perfections through the influence of God, but their imperfections come from their own natures, which cannot exist without limits. It is in this latter that they are distinguished from God. An example of this original imperfection of created things is to be found in the natural inertia of bodies.

43. It is true, furthermore, that in God is found not only the source of existences, but also that of essences, in so far as they are real. In other words, he is the source of whatever there is real in the possible. This is because the Understanding of God is in the region of eternal truths or of the ideas upon which they depend, and because without him there would be nothing real in the possibilities of things, and not only would nothing be existent, nothing would be even possible.

44. For it must needs be that if there is a reality in essences or in possibilities or indeed in the eternal 'truths, this reality is based upon something existent and actual, and, consequently, in the existence of the necessary Being in whom essence includes existence or in whom possibility is sufficient to produce actuality.

45. Therefore God alone (or the Necessary Being) has this prerogative that if he be possible he must necessarily exist, and, as nothing is able to prevent the possibility of that which involves no bounds, no negation and consequently, no contradiction, this alone is sufficient to establish <a priori> his existence. We have, therefore, proved his existence through the reality of eternal truths. But a little while ago we also proved it <a posteriori>, because contingent beings exist which can have their ultimate and sufficient reason only in the necessary being which, in turn, has the reason for existence in itself.

46. Yet we must not think that the eternal truths being dependent upon God are therefore arbitrary and depend upon his will, as Descartes seems to have held, and after him M. Poiret. This is the case only with contingent truths which depend upon fitness or the choice of the greatest good; necessarily truths on the other hand depend solely upon his understanding and are the inner objects of it.

47. God alone is the ultimate unity or the original simple

substance, of which all created or derivative monads are the products, and arise, so to speak, through the continual outflashings (fulgurations) of the divinity from moment to moment, limited by the receptivity of the creature to whom limitation is an essential.

48. In God are present: power, which is the source of everything; knowledge, which contains the details of the ideas; and, finally, will, which changes or produces things in accordance with the principle of the greatest good. To these correspond in the created monad, the subject or basis, the faculty of perception, and the faculty of appetition. In God these attributes are absolutely infinite or perfect, while in the created monads or in the entelechies (<perfectihabies>, as Hermolaus Barbarus translates this word), they are imitations approaching him in proportion to the perfection.

49. A created thing is said to act outwardly in so far as it has perfection, and to be acted upon by another in so far as it is imperfect. Thus action is attributed to the monad in so far as it has distinct perceptions, and passion or passivity is attributed in so far as it has confused perceptions.

50. One created thing is more perfect than another when we find in the first that which gives an <a priori> reason for what occurs in the second. This why we say that one acts upon the other.

51. In the case of simple substances, the influence which one monad has upon another is only ideal. It can have its effect only through the mediation of God, in so far as in the ideas of God each monad can rightly demand that God, in regulating the others from the beginning of things, should have regarded it also. For since one created monad cannot have a physical influence upon the inner being of another, it is only through the primal regulation that one can have dependence upon another.

52. It is thus that among created things action and passivity are reciprocal. For God, in comparing two simple substances, finds in each one reasons obliging him to adapt the other to it; and consequently what is active in certain respects is passive from another point of view, active in so far as what we distinctly know in it serves to give a reason for what occurs in another, and passive in so far as the reason for what occurs in it is found in what is distinctly known in another.

53. Now as there are an infinity of possible universes in the ideas of God, and but one of them can exist, there must be a sufficient reason' for the choice of God which determines him to select one rather than another.

54. And this reason is to be found only in the fitness or in the degree of perfection which these worlds possess, each possible thing having the right to claim existence in proportion to the perfection which it involves.

55. This is the cause for the existence of the greatest good; namely, that the wisdom of God permits him to know it, his goodness causes him to choose it, and his power enables him to produce it.

56. Now this interconnection, relationship, or this adaptation of all things to each particular one, and of each one to all the rest, brings it about that every simple substance has relations which express all the others and that it is consequently a perpetual living mirror of the universe.

57. And as the same city regarded from different sides appears entirely different, and is, as it were multiplied respectively, so, because of the infinite number of simple substances, there are a similar infinite number of universes which are, nevertheless, only the aspects of a single one as seen from the special point of view of each monad.

58. Through this means has been obtained the greatest possible variety, together with the greatest order that may be; that is to say, through this means has been obtained the greatest possible perfection.

59. This hypothesis, moreover, which I venture to call demonstrated, is the only one which fittingly gives proper prominence to the greatness of God. M. Bayle recognized this when in his dictionary (article "Rorarius") he raised objections to it; indeed, he was inclined to believe that I attributed too much to God, and more than it is possible to attribute to him: But he was unable to bring forward any reason why this universal harmony which causes every substance to express exactly all others through the relation which it has with them is impossible.

60. Besides, in what has just been said can be seen the <a priori> reasons why things cannot be otherwise than they are. It is because God, in ordering the whole, has had regard to every part and in particular to each monad; and since the monad is by its very <nature representative>, nothing can limit it to represent merely a part of things. It is nevertheless true that this representation is, as regards the details of the whole universe, only a confused representation, and is distinct only as regards a small part of them, that is to say, as regards those things which are nearest or greatest in relation to each monad. If the representation were distinct as to the details of the entire Universe, each monad would be a Deity. It is not in the object represented that the monads are limited, but in the modifications of their knowledge of the object. In a confused way they reach out to infinity or to the whole, but are limited and differentiated in the degree of their distinct perceptions.

61. In this respect composites are like simple substances, for all space is filled up; therefore, all matter is connected. And in a plenum or filled space every movement has an effect upon bodies in proportion to this distance, so that not only is every body affected by those which are in contact with it and responds in some way to whatever happens to them, but also by means of them the body responds to, those bodies adjoining them, and their intercommunication reaches to any distance whatsoever. Consequently every body responds to all that happens in the universe, so that h e who saw all could read in each one what is happening everywhere, and even what has happened and what will happen. He can discover in the present what is distant both as regards space and as regards time; "all things conspire" as Hippocrates said. A soul can, however, read in itself only what is there represented distinctly. It cannot all at once open up all its folds, because they extend to infinity.

62. Thus although each created monad represents the whole universe, it represents more distinctly the body which specially pertains to it and of which it constitutes the entelechy. And as this body expresses all the universe through the interconnection of all matter in the plenum, the soul also represents the whole universe in representing this body, which belongs to it in a particular way.

63. The body belonging to a monad, which is its entelechy or soul, constitutes together with the entelechy what may be called a <rising being>, and with a soul what is called an <animal>. Now this body of a living being or of an animal is always organic, because every monad is a mirror of the universe is regulated with perfect order there must needs be order also in what represents it, that is to say in the perceptions of the soul and consequently in the body through which the, universe is represented in the soul.

64. Therefore every organic body of a living being is a kind of divine machine or natural automaton, infinitely surpassing all artificial automatons. Because a machine constructed by man's skill is not a machine in each of its parts; for instance, the teeth of a brass wheel have parts or bits which to us are not artificial products and contain nothing in themselves to show the use to which the wheel was destined in the machine. The machines of nature, however, that is to say, living bodies, are still machines in their smallest parts <ad infinitum>. Such is the difference between nature and art, that is to say, between divine art and ours.

65. The author of nature has been able to employ this divine and infinitely marvelous artifice, because each portion of matter is not only, as the ancients recognized, infinitely divisible, but also because it is really divided without end, every part into other parts, each one of which has its own proper motion. Otherwise it would be impossible for each portion of matter to express all the universe.

66. Whence we see that there is a world of created things, of living beings, of animals, of entelechies, of souls, in the minutest particle of matter.

67. Every portion of matter may be conceived as like a garden full of plants and like a pond full of fish. But every branch of a plant, every member of an animal, and every drop of the fluids within it, is also such a garden or such a pond.

68. And although the ground and air which lies between the plants of the garden, and the water which is between the fish in the pond, are not themselves plants or fish, yet they nevertheless contain these, usually so small however as to be imperceptible to us.

69. There is, therefore, nothing uncultivated, or sterile or dead in the universe, no chaos, no confusion, save in appearance; somewhat as a pond would appear at a distance when we could see in it a confused movement, and so to speak, a swarming of the fish, without however discerning the fish themselves.

70. It is evident, then, that every living body has a

dominating entelechy, which in animals is the soul. The parts, however, of this living body are full of other living beings, plants and animals, which in turn have each one its entelechy or dominating soul.

71. This does not mean, as some who have misunderstood my thought have imagined, that each soul has a quantity or portion of matter appropriated to it or attached to itself for ever, and that it consequently owns other inferior living beings destined to serve it always; because all bodies are in a state of perpetual flux like rivers, and the parts are continually entering in or passing out.

72. The soul, therefore, changes its body only gradually and by degrees, so that it is never deprived all at once of all its organs. There is frequently a metamorphosis in animals, but never metempsychosis or a transmigration of souls. Neither are there souls wholly separate from bodies, nor bodiless spirits. God alone is without body.

73. This is also why there is never absolute generation or perfect death in the strict sense, consisting in the separation of the soul from the body. What we call generation is development and growth, and what we call death is envelopment and diminution.

74. Philosophers have been much perplexed in accounting for the origin of forms, entelechies, or souls. Today, however, when it has been learned through careful investigations made in plant, insect and animal life, that the organic bodies of nature are never the product of chaos or putrefaction, but always come from seeds in which there was without doubt some preformation, it has been decided that not only is the organic body already present before conception, but also a soul in this body, in a word, the animal itself; and it has been decided that, by means of conception the animal is merely made ready for a great transformation, so as to become an animal of another sort. We can see cases somewhat similar outside of generation when grubs become flies and caterpillars butterflies.

75. These little animals, some of which by conception become large animals' may be called spermatic. Those among them which remain in their species, that is to say, the greater part, are born, multiply, and are destroyed, like the larger animals. There are only a few chosen ones which come out upon a greater stage.

76. This, however, is only half the truth. I believe, therefore, that if the animal never actually commences by natural means, no more does it by natural means come to an end. Not only is there no generation, but also there is no entire destruction or absolute death. These reasonings, carried on <a posteriori> and drawn from experience, accord perfectly with the principles which I have above deduced <a priori>.

77. Therefore we may say that not only the soul (the mirror of the indestructible universe) is indestructible, but also the animal itself is, although its mechanism is frequently destroyed in parts and although it puts off and takes on organic coatings.

78. These principles have furnished me the means of explaining on natural grounds the union, or rather the conformity between the soul and the organic body. The soul follows its own

laws, and the body likewise follows its own laws. They are fitted to each other in virtue of the preestablished harmony between all substances ' since they are all representations of one and the same universe.

79. Souls act in accordance with the laws of final causes through their desires, ends and means. Bodies act in accordance with the laws of efficient causes or of motion. The two realms, that of efficient causes and that of final causes, are in harmony, each with the other.

80. Descartes saw that souls cannot at all impart force to bodies, because there is always the same quantity of force in matter. Yet he thought that the soul could change the direction of bodies. This was, however, because at that time the law of nature which affirms also that conservation of the same total direction in the motion of matter was not known. If he hid known that law, he would have fallen upon my system of preestablished harmony.

81. According to this system bodies act as if (to suppose the impossible) there were no souls at all, and souls act as if there were no bodies, and yet both body and soul act as if the one were influencing the other.

82. Although I find that essentially the same thing is true of all living things and animals, which we have just said (namely, that animals and souls begin from the very commencement of the world and that they no more come to an end than does the world) nevertheless, rational animals have this peculiarity, that their little spermatic animals, as long as they remain such, have only ordinary or sensuous souls, but those of them which are, so to speak, elected, attain by actual conception to human nature, and their sensuous souls are raised to the rank of reason and to the prerogative of spirits.

83. Among the differences that there are between ordinary souls and spirits, some of which I have already instanced, there is also this, that while souls in general are living mirrors or images of the universe of created things, spirits are also images of the Deity himself or of the author of nature. They are capable of knowing the system of the universe, and of imitating some features of it by means of artificial models, each spirit being like a small divinity in its own sphere.

84. Therefore, spirits are able to enter into a sort of social relationship with God, and with respect to them he is not only what an inventor is to his machine (as in his relation to the other created things), but be is also what a prince is to his subjects, and even what a father is to his children.

85. Whence it is easy to conclude that the totality of all spirits must compose the city of God, that is to say, the most perfect state that is possible under the most perfect monarch.

86. This city of God, this truly universal monarchy, is a moral world within the natural world. It is what is noblest and most divine among the works of God. And in it consists in reality the glory of God, because he would have no glory were not his greatness and goodness known and wondered at by spirits. It is also in relation to this divine city that God properly has

goodness. His wisdom and his power are shown everywhere.

87. As we established above that there is a perfect harmony between the two natural realms of efficient and final causes, it will be in place here to point out another harmony which appears between the physical realm of nature and the moral realm of grace, that is to say, between God considered as the architect of the mechanism of the world and God considered as the monarch of the divine city of spirits.

88. This harmony brings it about that things progress of themselves toward grace along natural lines, and that this earth, for example, must be destroyed and restored by natural means at those times when the proper government of spirits demands it, for chastisement in the one case and for a reward in the other.

89. We can say also that God, the Architect, satisfies in all respects God the Law Giver, that therefore sins will bring their own penalty with them through the order of nature, and because of the very structure of things, mechanical though it is. And in the same way the good actions will attain their rewards in mechanical way through their relation to bodies, although this cannot and ought not always to take place without delay.

90. Finally, under this perfect government, there will be no good action unrewarded and no evil action unpunished; everything must turn out for the well-being of the good; that is to say, of those who are not disaffected in this great state, who, after having done their duty, trust in Providence and who love and imitate, as is meet, the Author of all Good, delighting in the contemplation of his perfections according to the nature of that genuine, pure love which finds pleasure in the happiness of those who are loved. It is for this reason that wise and virtuous persons work in behalf of everything which seems conformable to presumptive or antecedent will of God, and are, nevertheless, content with what God actually brings to pass through his secret, consequent and determining will, recognizing that if we were able to understand sufficiently well the order of the universe, we should find that it surpasses all the desires of the wisest of us, and that it is impossible to render it better than it is, not only for all in general, but also for each one of us in particular, provided that we have the proper attachment for the author of all, not only as the Architect and the efficient cause of our being, but also as our Lord and the Final Cause, who ought to be the whole goal of our will, and who alone can make us happy.

A Letter Concerning Toleration

John Locke

1/20/96

HONOURED SIR,

Since you are pleased to inquire what are my thoughts about the mutual toleration of Christians in their different professions of religion, I must needs answer you freely that I esteem that toleration to be the chief characteristic mark of the true Church. For whatsoever some people boast of the antiquity of places and names, or of the pomp of their outward worship; others, of the reformation of their discipline; all, of the orthodoxy of their faith- for everyone is orthodox to himself- these things, and all others of this nature, are much rather marks of men striving for power and empire over one another than of the Church of Christ. Let anyone have never so true a claim to all these things, yet if he be destitute of charity, meekness, and good-will in general towards all mankind, even to those that are not Christians, he is certainly yet short of being a true Christian himself. "The kings of the Gentiles exercise leadership over them," said our Saviour to his disciples, "but ye shall not be so" (Luke 22. 25). The business of true religion is quite another thing. It is not instituted in order to the erecting of an external pomp, nor to the obtaining of ecclesiastical dominion, nor to the exercising of compulsive force, but to the regulating of men's lives, according to the rules of virtue and piety. Whosoever will list himself under the banner of Christ, must, in the first place and above all things, make war upon his own lusts and vices. It is in vain for any man to unsurp the name of Christian, without holiness of life, purity of manners, benignity and meekness of spirit. "Let everyone that nameth the name of Christ, depart from iniquity" (II Tim. 2. 19). "Thou, when thou art converted, strengthen thy brethren," said our Lord to Peter (Luke 22. 32). It would, indeed, be very hard for one that appears careless about his own salvation to persuade me that he were extremely concerned for mine. For it is impossible that those should sincerely and heartily apply themselves to make other people Christians, who have not really embraced the Christian religion in their own hearts. If the Gospel and the apostles may be credited, no man can be a Christian without charity and without that faith which works, not by force, but by love. Now, I appeal to the consciences of those that persecute, torment, destroy, and kill other men upon pretence of religion, whether they do it out of friendship and kindness towards them or no? And I shall then indeed, and not until then, believe they do so, when I shall see those fiery zealots

correcting, in the same manner, their friends and familiar acquaintance for the manifest sins they commit against the precepts of the Gospel; when I shall see them persecute with fire and sword the members of their own communion that are tainted with enormous vices and without amendment are in danger of eternal perdition; and when I shall see them thus express their love and desire of the salvation of their souls by the infliction of torments and exercise of all manner of cruelties. For if it be out of a principle of charity, as they pretend, and love to men's souls that they deprive them of their estates, maim them with corporal punishments, starve and torment them in noisome prisons, and in the end even take away their lives- I say, if all this be done merely to make men Christians and procure their salvation, why then do they suffer whoredom, fraud, malice, and such-like enormities, which (according to the apostle; Rom. I). manifestly relish of heathenish corruption, to predominate so much and abound amongst their flocks and people? These, and such-like things, are certainly more contrary to the glory of God, to the purity of the Church, and to the salvation of souls, than any conscientious dissent from ecclesiastical decisions, or separation from public worship, whilst accompanied with innocence of life. Why, then, does this burning zeal for God, for the Church, and for the salvation of souls- burning I say, literally, with fire and faggot- pass by those moral vices and wickednesses, without any chastisement, which are acknowledged by all men to be diametrically opposite to the profession of Christianity, and bend all its nerves either to the introducing of ceremonies, or to the establishment of opinions, which for the most part are about nice and intricate matters, that exceed the capacity of ordinary understandings? Which of the parties contending about these things is in the right, which of them is guilty of schism or heresy, whether those that domineer or those that suffer, will then at last be manifest when the causes of their separation comes to be judged of He, certainly, that follows Christ, embraces His doctrine, and bears His yoke, though he forsake both father and mother, separate from the public assemblies and ceremonies of his country, or whomsoever or whatsoever else he relinquishes, will not then be judged a heretic.

Now, though the divisions that are amongst sects should be allowed to be never so obstructive of the salvation of souls; yet, nevertheless, adultery, fornication, uncleanliness, lasciviousness, idolatry, and such-like things, cannot be denied to be works of the flesh, concerning which the apostle has expressly declared that "they who do them shall not inherit the kingdom of God" (Gal. 5). Whosoever, therefore, is sincerely solicitous about the kingdom of God and thinks it his duty to endeavour the enlargement of it amongst men, ought to apply himself with no less care and industry to the rooting out of these immoralities than to the extirpation of sects. But if anyone do otherwise, and whilst he is cruel and implacable towards those that differ from him in opinion, he be indulgent to such iniquities and immoralities as are unbecoming the name of a Christian, let such a one talk never so much of the Church, he plainly demonstrates by his actions that it is another kingdom he aims at and not the advancement of the kingdom of God.

That any man should think fit to cause another man- whose salvation he heartily desires- to expire in torments, and that even in an unconverted state, would, I confess, seem very strange to me, and I think, to any other also. But nobody, surely, will ever believe that such a carriage can proceed from charity, love, or goodwill. If anyone maintain that men ought to be compelled by fire and sword to profess certain doctrines, and conform to this or that exterior worship, without any regard had unto their morals; if anyone endeavour to convert those that are erroneous unto the faith, by forcing them to profess things that they do not believe and allowing them to practise things that the Gospel does not permit, it cannot be doubted indeed but such a one is desirous to have a numerous assembly joined in the same profession with himself; but that he principally intends by those

means to compose a truly Christian Church is altogether incredible. It is not, therefore, to be wondered at if those who do not really contend for the advancement of the true religion, and of the Church of Christ, make use of arms that do not belong to the Christian warfare. If, like the Captain of our salvation, they sincerely desired the good of souls, they would tread in the steps and follow the perfect example of that Prince of Peace, who sent out His soldiers to the subduing of nations, and gathering them into His Church, not armed with the sword, or other instruments of force, but prepared with the Gospel of peace and with the exemplary holiness of their conversation. This was His method. Though if infidels were to be converted by force, if those that are either blind or obstinate were to be drawn off from their errors by armed soldiers, we know very well that it was much more easy for Him to do it with armies of heavenly legions than for any son of the Church, how potent soever, with all his dragoons.

The toleration of those that differ from others in matters of religion is so agreeable to the Gospel of Jesus Christ, and to the genuine reason of mankind, that it seems monstrous for men to be so blind as not to perceive the necessity and advantage of it in so clear a light. I will not here tax the pride and ambition of some, the passion and uncharitable zeal of others. These are faults from which human affairs can perhaps scarce ever be perfectly freed; but yet such as nobody will bear the plain imputation of, without covering them with some specious colour; and so pretend to commendation, whilst they are carried away by their own irregular passions. But, however, that some may not colour their spirit of persecution and unchristian cruelty with a pretence of care of the public weal and observation of the laws; and that others, under pretence of religion, may not seek impunity for their libertinism and licentiousness; in a word, that none may impose either upon himself or others, by the pretences of loyalty and obedience to the prince, or of tenderness and sincerity in the worship of God; I esteem it above all things necessary to distinguish exactly the business of civil government from that of religion and to settle the just bounds that lie between the one and the other. If this be not done, there can be no end put to the controversies that will be always arising between those that have, or at least pretend to have, on the one side, a concernment for the interest of men's souls, and, on the other side, a care of the commonwealth.

The commonwealth seems to me to be a society of men constituted only for the procuring, preserving, and advancing their own civil interests.

Civil interests I call life, liberty, health, and indolency of body; and the possession of outward things, such as money, lands, houses, furniture, and the like.

It is the duty of the civil magistrate, by the impartial execution of equal laws, to secure unto all the people in general and to every one of his subjects in particular the just possession of these things belonging to this life. If anyone presume to violate the laws of public justice and equity, established for the preservation of those things, his presumption is to be checked by the fear of punishment, consisting of the deprivation or diminution of those civil interests, or goods, which otherwise he might and ought to enjoy. But seeing no man does willingly suffer himself to be punished by the deprivation of any part of his goods, and much less of his liberty or life, therefore, is the magistrate armed with the force and strength of all his subjects, in order to the punishment of those that violate any other man's rights.

Now that the whole jurisdiction of the magistrate reaches only to these civil concernments, and that all civil power, right and dominion, is bounded and confined to the only care of promoting these things; and that it neither can nor ought in any manner to be extended to the salvation of souls, these following considerations seem unto me abundantly to demonstrate.

First, because the care of souls is not committed to the civil magistrate, any more than to other men. It is not committed unto him, I say, by God; because it appears not that God has ever given any such authority to one man over another as to compel anyone to his religion. Nor can any such power be vested in the magistrate by the consent of the people, because no man can so far abandon the care of his own salvation as blindly to leave to the choice of any other, whether prince or subject, to prescribe to him what faith or worship he shall embrace. For no man can, if he would, conform his faith to the dictates of another. All the life and power of true religion consist in the inward and full persuasion of the mind; and faith is not faith without believing. Whatever profession we make, to whatever outward worship we conform, if we are not fully satisfied in our own mind that the one is true and the other well pleasing unto God, such profession and such practice, far from being any furtherance, are indeed great obstacles to our salvation. For in this manner, instead of expiating other sins by the exercise of religion, I say, in offering thus unto God Almighty such a worship as we esteem to be displeasing unto Him, we add unto the number of our other sins those also of hypocrisy and contempt of His Divine Majesty.

In the second place, the care of souls cannot belong to the civil magistrate, because his power consists only in outward force; but true and saving religion consists in the inward persuasion of the mind, without which nothing can be acceptable to God. And such is the nature of the understanding, that it cannot be compelled to the belief of anything by outward force. Confiscation of estate, imprisonment, torments, nothing of that nature can have any such efficacy as to make men change the inward judgement that they have framed of things.

It may indeed be alleged that the magistrate may make use of arguments, and, thereby; draw the heterodox into the way of truth, and procure their salvation. I grant it; but this is common to him with other men. In teaching, instructing, and redressing the erroneous by reason, he may certainly do what becomes any good man to do. Magistracy does not oblige him to put off either humanity or Christianity; but it is one thing to persuade, another to command; one thing to press with arguments, another with penalties. This civil power alone has a right to do; to the other, goodwill is authority enough. Every man has commission to admonish, exhort, convince another of error, and, by reasoning, to draw him into truth; but to give laws, receive obedience, and compel with the sword, belongs to none but the magistrate. And, upon this ground, I affirm that the magistrate's power extends not to the establishing of any articles of faith, or forms of worship, by the force of his laws. For laws are of no force at all without penalties, and penalties in this case are absolutely impertinent, because they are not proper to convince the mind. Neither the profession of any articles of faith, nor the conformity to any outward form of worship (as has been already said), can be available to the salvation of souls, unless the truth of the one and the acceptableness of the other unto God be thoroughly believed by those that so profess and practise. But penalties are no way capable to produce such belief. It is only light and evidence that can work a change in men's opinions; which light can in no manner proceed from corporal sufferings, or any other outward penalties.

In the third place, the care of the salvation of men's souls cannot belong to the magistrate; because, though the rigour of laws and the force of penalties were capable to convince and change men's minds, yet would not that help at all to the salvation of their souls. For there being but one truth, one way to heaven, what hope is there that more men would be led into it if they had no rule but the religion of the court and were put under the necessity to quit the light of their own reason, and oppose the dictates of their own consciences, and blindly to resign themselves up to the will of their governors and to the religion which either ignorance, ambition, or superstition had chanced to

establish in the countries where they were born? In the variety and contradiction of opinions in religion, wherein the princes of the world are as much divided as in their secular interests, the narrow way would be much straitened; one country alone would be in the right, and all the rest of the world put under an obligation of following their princes in the ways that lead to destruction; and that which heightens the absurdity, and very ill suits the notion of a Deity, men would owe their eternal happiness or misery to the places of their nativity.

These considerations, to omit many others that might have been urged to the same purpose, seem unto me sufficient to conclude that all the power of civil government relates only to men's civil interests, is confined to the care of the things of this world, and hath nothing to do with the world to come.

Let us now consider what a church is. A church, then, I take to be a voluntary society of men, joining themselves together of their own accord in order to the public worshipping of God in such manner as they judge acceptable to Him, and effectual to the salvation of their souls.

I say it is a free and voluntary society. Nobody is born a member of any church; otherwise the religion of parents would descend unto children by the same right of inheritance as their temporal estates, and everyone would hold his faith by the same tenure he does his lands, than which nothing can be imagined more absurd. Thus, therefore, that matter stands. No man by nature is bound unto any particular church or sect, but everyone joins himself voluntarily to that society in which he believes he has found that profession and worship which is truly acceptable to God. The hope of salvation, as it was the only cause of his entrance into that communion, so it can be the only reason of his stay there. For if afterwards he discover anything either erroneous in the doctrine or incongruous in the worship of that society to which he has joined himself, why should it not be as free for him to go out as it was to enter? No member of a religious society can be tied with any other bonds but what proceed from the certain expectation of eternal life. A church, then, is a society of members voluntarily uniting to that end.

It follows now that we consider what is the power of this church and unto what laws it is subject.

Forasmuch as no society, how free soever, or upon whatsoever slight occasion instituted, whether of philosophers for learning, of merchants for commerce, or of men of leisure for mutual conversation and discourse, no church or company, I say, can in the least subsist and hold together, but will presently dissolve and break in pieces, unless it be regulated by some laws, and the members all consent to observe some order. Place and time of meeting must be agreed on; rules for admitting and excluding members must be established; distinction of officers, and putting things into a regular course, and suchlike, cannot be omitted. But since the joining together of several members into this church-society, as has already been demonstrated, is absolutely free and spontaneous, it necessarily follows that the right of making its laws can belong to none but the society itself; or, at least (which is the same thing), to those whom the society by common consent has authorised thereunto.

Some, perhaps, may object that no such society can be said to be a true church unless it have in it a bishop or presbyter, with ruling authority derived from the very apostles, and continued down to the present times by an uninterrupted succession.

To these I answer: In the first place, let them show me the edict by which Christ has imposed that law upon His Church. And let not any man think me impertinent, if in a thing of this consequence I require that the terms of that edict be very express and positive; for the promise He has made us (Matt. 18. 20), that "wheresoever two or three are gathered together" in His name, He will be in

the midst of them, seems to imply the contrary. Whether such an assembly want anything necessary to a true church, pray do you consider. Certain I am that nothing can be there wanting unto the salvation of souls, which is sufficient to our purpose.

Next, pray observe how great have always been the divisions amongst even those who lay so much stress upon the Divine institution and continued succession of a certain order of rulers in the Church. Now, their very dissension unavoidably puts us upon a necessity of deliberating and, consequently, allows a liberty of choosing that which upon consideration we prefer.

And, in the last place, I consent that these men have a ruler in their church, established by such a long series of succession as they judge necessary, provided I may have liberty at the same time to join myself to that society in which I am persuaded those things are to be found which are necessary to the salvation of my soul. In this manner ecclesiastical liberty will be preserved on all sides, and no man will have a legislator imposed upon him but whom himself has chosen.

But since men are so solicitous about the true church, I would only ask them here, by the way, if it be not more agreeable to the Church of Christ to make the conditions of her communion consist in such things, and such things only, as the Holy Spirit has in the Holy Scriptures declared, in express words, to be necessary to salvation; I ask, I say, whether this be not more agreeable to the Church of Christ than for men to impose their own inventions and interpretations upon others as if they were of Divine authority, and to establish by ecclesiastical laws, as absolutely necessary to the profession of Christianity, such things as the Holy Scriptures do either not mention, or at least not expressly command? Whosoever requires those things in order to ecclesiastical communion, which Christ does not require in order to life eternal, he may, perhaps, indeed constitute a society accommodated to his own opinion and his own advantage; but how that can be called the Church of Christ which is established upon laws that are not His, and which excludes such persons from its communion as He will one day receive into the Kingdom of Heaven, I understand not. But this being not a proper place to inquire into the marks of the true church, I will only mind those that contend so earnestly for the decrees of their own society, and that cry out continually, "The Church! the Church!" with as much noise, and perhaps upon the same principle, as the Ephesian silversmiths did for their Diana; this, I say, I desire to mind them of, that the Gospel frequently declares that the true disciples of Christ must suffer persecution; but that the Church of Christ should persecute others, and force others by fire and sword to embrace her faith and doctrine, I could never yet find in any of the books of the New Testament.

The end of a religious society (as has already been said) is the public worship of God and, by means thereof, the acquisition of eternal life. All discipline ought, therefore, to tend to that end, and all ecclesiastical laws to be thereunto confined. Nothing ought nor can be transacted in this society relating to the possession of civil and worldly goods. No force is here to be made use of upon any occasion whatsoever. For force belongs wholly to the civil magistrate, and the possession of all outward goods is subject to his jurisdiction.

But, it may be asked, by what means then shall ecclesiastical laws be established, if they must be thus destitute of all compulsive power? I answer: They must be established by means suitable to the nature of such things, whereof the external profession and observation- if not proceeding from a thorough conviction and approbation of the mind- is altogether useless and unprofitable. The arms by which the members of this society are to be kept within their duty are exhortations, admonitions, and advices. If by these means the offenders will not be reclaimed, and the erroneous convinced, there remains nothing further to be done but that such stubborn and obstinate persons,

who give no ground to hope for their reformation, should be cast out and separated from the society. This is the last and utmost force of ecclesiastical authority. No other punishment can thereby be inflicted than that, the relation ceasing between the body and the member which is cut off. The person so condemned ceases to be a part of that church.

These things being thus determined, let us inquire, in the next place: How far the duty of toleration extends, and what is required from everyone by it?

And, first, I hold that no church is bound, by the duty of toleration, to retain any such person in her bosom as, after admonition, continues obstinately to offend against the laws of the society. For, these being the condition of communion and the bond of the society, if the breach of them were permitted without any animadversion the society would immediately be thereby dissolved. But, nevertheless, in all such cases care is to be taken that the sentence of excommunication, and the execution thereof, carry with it no rough usage of word or action whereby the ejected person may any wise be damnified in body or estate. For all force (as has often been said) belongs only to the magistrate, nor ought any private persons at any time to use force, unless it be in self-defence against unjust violence. Excommunication neither does, nor can, deprive the excommunicated person of any of those civil goods that he formerly possessed. All those things belong to the civil government and are under the magistrate's protection. The whole force of excommunication consists only in this: that, the resolution of the society in that respect being declared, the union that was between the body and some member comes thereby to be dissolved; and, that relation ceasing, the participation of some certain things which the society communicated to its members, and unto which no man has any civil right, comes also to cease. For there is no civil injury done unto the excommunicated person by the church minister's refusing him that bread and wine, in the celebration of the Lord's Supper, which was not bought with his but other men's money.

Secondly, no private person has any right in any manner to prejudice another person in his civil enjoyments because he is of another church or religion. All the rights and franchises that belong to him as a man, or as a denizen, are inviolably to be preserved to him. These are not the business of religion. No violence nor injury is to be offered him, whether he be Christian or Pagan. Nay, we must not content ourselves with the narrow measures of bare justice; charity, bounty, and liberality must be added to it. This the Gospel enjoins, this reason directs, and this that natural fellowship we are born into requires of us. If any man err from the right way, it is his own misfortune, no injury to thee; nor therefore art thou to punish him in the things of this life because thou supposest he will be miserable in that which is to come.

What I say concerning the mutual toleration of private persons differing from one another in religion, I understand also of particular churches which stand, as it were, in the same relation to each other as private persons among themselves: nor has any one of them any manner of jurisdiction over any other; no, not even when the civil magistrate (as it sometimes happens) comes to be of this or the other communion. For the civil government can give no new right to the church, nor the church to the civil government. So that, whether the magistrate join himself to any church, or separate from it, the church remains always as it was before- a free and voluntary society. It neither requires the power of the sword by the magistrate's coming to it, nor does it lose the right of instruction and excommunication by his going from it. This is the fundamental and immutable right of a spontaneous society- that it has power to remove any of its members who transgress the rules of its institution; but it cannot, by the accession of any new members, acquire any right of jurisdiction over those that are not joined with it. And therefore peace, equity, and friendship are always mutually to be observed by particular churches, in the same manner as by private persons,

without any pretence of superiority or jurisdiction over one another.

That the thing may be made clearer by an example, let us suppose two churches- the one of Arminians, the other of Calvinists- residing in the city of Constantinople. Will anyone say that either of these churches has right to deprive the members of the other of their estates and liberty (as we see practised elsewhere) because of their differing from it in some doctrines and ceremonies, whilst the Turks, in the meanwhile, silently stand by and laugh to see with what inhuman cruelty Christians thus rage against Christians? But if one of these churches hath this power of treating the other ill, I ask which of them it is to whom that power belongs, and by what right? It will be answered, undoubtedly, that it is the orthodox church which has the right of authority over the erroneous or heretical. This is, in great and specious words, to say just nothing at all. For every church is orthodox to itself; to others, erroneous or heretical. For whatsoever any church believes, it believes to be true and the contrary unto those things it pronounce; to be error. So that the controversy between these churches about the truth of their doctrines and the purity of their worship is on both sides equal; nor is there any judge, either at Constantinople or elsewhere upon earth, by whose sentence it can be determined. The decision of that question belongs only to the Supreme judge of all men, to whom also alone belongs the punishment of the erroneous. In the meanwhile, let those men consider how heinously they sin, who, adding injustice, if not to their error, yet certainly to their pride, do rashly and arrogantly take upon them to misuse the servants of another master, who are not at all accountable to them.

Nay, further: if it could be manifest which of these two dissenting churches were in the right, there would not accrue thereby unto the orthodox any right of destroying the other. For churches have neither any jurisdiction in worldly matters, nor are fire and sword any proper instruments wherewith to convince men's minds of error, and inform them of the truth. Let us suppose, nevertheless, that the civil magistrate inclined to favour one of them and to put his sword into their hands that (by his consent) they might chastise the dissenters as they pleased. Will any man say that any right can be derived unto a Christian church over its brethren from a Turkish emperor? An infidel, who has himself no authority to punish Christians for the articles of their faith, cannot confer such an authority upon any society of Christians, nor give unto them a right which he has not himself. This would be the case at Constantinople; and the reason of the thing is the same in any Christian kingdom. The civil power is the same in every place. Nor can that power, in the hands of a Christian prince, confer any greater authority upon the Church than in the hands of a heathen; which is to say, just none at all.

Nevertheless, it is worthy to be observed and lamented that the most violent of these defenders of the truth, the opposers of errors, the exclaimers against schism do hardly ever let loose this their zeal for God, with which they are so warmed and inflamed, unless where they have the civil magistrate on their side. But so soon as ever court favour has given them the better end of the staff, and they begin to feel themselves the stronger, then presently peace and charity are to be laid aside. Otherwise they are religiously to be observed. Where they have not the power to carry on persecution and to become masters, there they desire to live upon fair terms and preach up toleration. When they are not strengthened with the civil power, then they can bear most patiently and unmovedly the contagion of idolatry, superstition, and heresy in their neighbourhood; of which on other occasions the interest of religion makes them to be extremely apprehensive. They do not forwardly attack those errors which are in fashion at court or are countenanced by the government. Here they can be content to spare their arguments; which yet (with their leave) is the only right method of propagating truth, which has no such way of prevailing as when strong

arguments and good reason are joined with the softness of civility and good usage.

Nobody, therefore, in fine, neither single persons nor churches, nay, nor even commonwealths, have any just title to invade the civil rights and worldly goods of each other upon pretence of religion. Those that are of another opinion would do well to consider with themselves how pernicious a seed of discord and war, how powerful a provocation to endless hatreds, rapines, and slaughters they thereby furnish unto mankind. No peace and security, no, not so much as common friendship, can ever be established or preserved amongst men so long as this opinion prevails, that dominion is founded in grace and that religion is to be propagated by force of arms.

In the third place, let us see what the duty of toleration requires from those who are distinguished from the rest of mankind (from the laity, as they please to call us) by some ecclesiastical character and office; whether they be bishops, priests, presbyters, ministers, or however else dignified or distinguished. It is not my business to inquire here into the original of the power or dignity of the clergy. This only I say, that, whencesoever their authority be sprung, since it is ecclesiastical, it ought to be confined within the bounds of the Church, nor can it in any manner be extended to civil affairs, because the Church itself is a thing absolutely separate and distinct from the commonwealth. The boundaries on both sides are fixed and immovable. He jumbles heaven and earth together, the things most remote and opposite, who mixes these two societies, which are in their original, end, business, and in everything perfectly distinct and infinitely different from each other. No man, therefore, with whatsoever ecclesiastical office he be dignified, can deprive another man that is not of his church and faith either of liberty or of any part of his worldly goods upon the account of that difference between them in religion. For whatsoever is not lawful to the whole Church cannot by any ecclesiastical right become lawful to any of its members.

But this is not all. It is not enough that ecclesiastical men abstain from violence and rapine and all manner of persecution. He that pretends to be a successor of the apostles, and takes upon him the office of teaching, is obliged also to admonish his hearers of the duties of peace and goodwill towards all men, as well towards the erroneous as the orthodox; towards those that differ from them in faith and worship as well as towards those that agree with them therein. And he ought industriously to exhort all men, whether private persons or magistrates (if any such there be in his church), to charity, meekness, and toleration, and diligently endeavour to ally and temper all that heat and unreasonable averseness of mind which either any man's fiery zeal for his own sect or the craft of others has kindled against dissenters. I will not undertake to represent how happy and how great would be the fruit, both in Church and State, if the pulpits everywhere sounded with this doctrine of peace and toleration, lest I should seem to reflect too severely upon those men whose dignity I desire not to detract from, nor would have it diminished either by others or themselves. But this I say, that thus it ought to be. And if anyone that professes himself to be a minister of the Word of God, a preacher of the gospel of peace, teach otherwise, he either understands not or neglects the business of his calling and shall one day give account thereof unto the Prince of Peace. If Christians are to be admonished that they abstain from all manner of revenge, even after repeated provocations and multiplied injuries, how much more ought they who suffer nothing, who have had no harm done them, forbear violence and abstain from all manner of ill-usage towards those from whom they have received none! This caution and temper they ought certainly to use towards those. who mind only their own business and are solicitous for nothing but that (whatever men think of them) they may worship God in that manner which they are persuaded is acceptable to Him and in which they have the strongest hopes of eternal salvation. In private domestic affairs, in the management of estates, in the conservation of bodily health, every man may consider what

suits his own convenience and follow what course he likes best. No man complains of the ill-management of his neighbour's affairs. No man is angry with another for an error committed in sowing his land or in marrying his daughter. Nobody corrects a spendthrift for consuming his substance in taverns. Let any man pull down, or build, or make whatsoever expenses he pleases, nobody murmurs, nobody controls him; he has his liberty. But if any man do not frequent the church, if he do not there conform his behaviour exactly to the accustomed ceremonies, or if he brings not his children to be initiated in the sacred mysteries of this or the other congregation, this immediately causes an uproar. The neighbourhood is filled with noise and clamour. Everyone is ready to be the avenger of so great a crime, and the zealots hardly have the patience to refrain from violence and rapine so long till the cause be heard and the poor man be, according to form, condemned to the loss of liberty, goods, or life. Oh, that our ecclesiastical orators of every sect would apply themselves with all the strength of arguments that they are able to the confounding of men's errors! But let them spare their persons. Let them not supply their want of reasons with the instruments of force, which belong to another jurisdiction and do ill become a Churchman's hands. Let them not call in the magistrate's authority to the aid of their eloquence or learning, lest perhaps, whilst they pretend only love for the truth, this their intemperate zeal, breathing nothing but fire and sword, betray their ambition and show that what they desire is temporal dominion. For it will be very difficult to persuade men of sense that he who with dry eyes and satisfaction of mind can deliver his brother to the executioner to be burnt alive, does sincerely and heartily concern himself to save that brother from the flames of hell in the world to come.

In the last place, let us now consider what is the magistrate's duty in the business of toleration, which certainly is very considerable.

We have already proved that the care of souls does not belong to the magistrate. Not a magisterial care, I mean (if I may so call it), which consists in prescribing by laws and compelling by punishments. But a charitable care, which consists in teaching, admonishing, and persuading, cannot be denied unto any man. The care, therefore, of every man's soul belongs unto himself and is to be left unto himself. But what if he neglect the care of his soul? I answer: What if he neglect the care of his health or of his estate, which things are nearlier related to the government of the magistrate than the other? Will the magistrate provide by an express law that such a one shall not become poor or sick? Laws provide, as much as is possible, that the goods and health of subjects be not injured by the fraud and violence of others; they do not guard them from the negligence or ill-husbandry of the possessors themselves. No man can be forced to be rich or healthful whether he will or no. Nay, God Himself will not save men against their wills. Let us suppose, however, that some prince were desirous to force his subjects to accumulate riches, or to preserve the health and strength of their bodies. Shall it be provided by law that they must consult none but Roman physicians, and shall everyone be bound to live according to their prescriptions? What, shall no potion, no broth, be taken, but what is prepared either in the Vatican, suppose, or in a Geneva shop? Or, to make these subjects rich, shall they all be obliged by law to become merchants or musicians? Or, shall everyone turn victualler, or smith, because there are some that maintain their families plentifully and grow rich in those professions? But, it may be said, there are a thousand ways to wealth, but one only way to heaven. It is well said, indeed, especially by those that plead for compelling men into this or the other way. For if there were several ways that led thither, there would not be so much as a pretence left for compulsion. But now, if I be marching on with my utmost vigour in that way which, according to the sacred geography, leads straight to Jerusalem, why am I beaten and ill-used by others because, perhaps, I wear not buskins; because my hair is

not of the right cut; because, perhaps, I have not been dipped in the right fashion; because I eat flesh upon the road, or some other food which agrees with my stomach; because I avoid certain by-ways, which seem unto me to lead into briars or precipices; because, amongst the several paths that are in the same road, I choose that to walk in which seems to be the straightest and cleanest; because I avoid to keep company with some travellers that are less grave and others that are more sour than they ought to be; or, in fine, because I follow a guide that either is, or is not, clothed in white, or crowned with a mitre? Certainly, if we consider right, we shall find that, for the most part, they are such frivolous things as these that (without any prejudice to religion or the salvation of souls, if not accompanied with superstition or hypocrisy) might either be observed or omitted. I say they are such-like things as these which breed implacable enmities amongst Christian brethren, who are all agreed in the substantial and truly fundamental part of religion.

But let us grant unto these zealots, who condemn all things that are not of their mode, that from these circumstances are different ends. What shall we conclude from thence? There is only one of these which is the true way to eternal happiness: but in this great variety of ways that men follow, it is still doubted which is the right one. Now, neither the care of the commonwealth, nor the right enacting of laws, does discover this way that leads to heaven more certainly to the magistrate than every private man's search and study discovers it unto himself. I have a weak body, sunk under a languishing disease, for which (I suppose) there is one only remedy, but that unknown. Does it therefore belong unto the magistrate to prescribe me a remedy, because there is but one, and because it is unknown? Because there is but one way for me to escape death, will it therefore be safe for me to do whatsoever the magistrate ordains? Those things that every man ought sincerely to inquire into himself, and by meditation, study, search, and his own endeavours, attain the knowledge of, cannot be looked upon as the peculiar possession of any sort of men. Princes, indeed, are born superior unto other men in power, but in nature equal. Neither the right nor the art of ruling does necessarily carry along with it the certain knowledge of other things, and least of all of true religion. For if it were so, how could it come to pass that the lords of the earth should differ so vastly as they do in religious matters? But let us grant that it is probable the way to eternal life may be better known by a prince than by his subjects, or at least that in this incertitude of things the safest and most commodious way for private persons is to follow his dictates. You will say: "What then?" If he should bid you follow merchandise for your livelihood, would you decline that course for fear it should not succeed? I answer: I would turn merchant upon the prince's command, because, in case I should have ill-success in trade, he is abundantly able to make up my loss some other way. If it be true, as he pretends, that he desires I should thrive and grow rich, he can set me up again when unsuccessful voyages have broken me. But this is not the case in the things that regard the life to come; if there I take a wrong course, if in that respect I am once undone, it is not in the magistrate's power to repair my loss, to ease my suffering, nor to restore me in any measure, much less entirely, to a good estate. What security can be given for the Kingdom of Heaven?

Perhaps some will say that they do not suppose this infallible judgement, that all men are bound to follow in the affairs of religion, to be in the civil magistrate, but in the Church. What the Church has determined, that the civil magistrate orders to be observed; and he provides by his authority that nobody shall either act or believe in the business of religion otherwise than the Church teaches. So that the judgement of those things is in the Church; the magistrate himself yields obedience thereunto and requires the like obedience from others. I answer: Who sees not how frequently the name of the Church, which was venerable in time of the apostles, has been made use

of to throw dust in the people's eyes in the following ages? But, however, in the present case it helps us not. The one only narrow way which leads to heaven is not better known to the magistrate than to private persons, and therefore I cannot safely take him for my guide, who may probably be as ignorant of the way as myself, and who certainly is less concerned for my salvation than I myself am. Amongst so many kings of the Jews, how many of them were there whom any Israelite, thus blindly following, had not fallen into idolatry and thereby into destruction? Yet, nevertheless, you bid me be of good courage and tell me that all is now safe and secure, because the magistrate does not now enjoin the observance of his own decrees in matters of religion, but only the decrees of the Church. Of what Church, I beseech you? of that, certainly, which likes him best. As if he that compels me by laws and penalties to enter into this or the other Church, did not interpose his own judgement in the matter. What difference is there whether he lead me himself, or deliver me over to be led by others? I depend both ways upon his will, and it is he that determines both ways of my eternal state. Would an Israelite that had worshipped Baal upon the command of his king have been in any better condition because somebody had told him that the king ordered nothing in religion upon his own head, nor commanded anything to be done by his subjects in divine worship but what was approved by the counsel of priests, and declared to be of divine right by the doctors of their Church? If the religion of any Church become, therefore, true and saving, because the head of that sect, the prelates and priests, and those of that tribe, do all of them, with all their might, extol and praise it, what religion can ever be accounted erroneous, false, and destructive? I am doubtful concerning the doctrine of the Socinians, I am suspicious of the way of worship practised by the Papists, or Lutherans; will it be ever a jot safer for me to join either unto the one or the other of those Churches, upon the magistrate's command, because he commands nothing in religion but by the authority and counsel of the doctors of that Church?

But, to speak the truth, we must acknowledge that the Church (if a convention of clergymen, making canons, must be called by that name) is for the most part more apt to be influenced by the Court than the Court by the Church. How the Church was under the vicissitude of orthodox and Arian emperors is very well known. Or if those things be too remote, our modern English history affords us fresh examples in the reigns of Henry VIII, Edward VI, Mary, and Elizabeth, how easily and smoothly the clergy changed their decrees, their articles of faith, their form of worship, everything according to the inclination of those kings and queens. Yet were those kings and queens of such different minds in point of religion, and enjoined thereupon such different things, that no man in his wits (I had almost said none but an atheist) will presume to say that any sincere and upright worshipper of God could, with a safe conscience, obey their several decrees. To conclude, it is the same thing whether a king that prescribes laws to another man's religion pretend to do it by his own judgement, or by the ecclesiastical authority and advice of others. The decisions of churchmen, whose differences and disputes are sufficiently known, cannot be any sounder or safer than his; nor can all their suffrages joined together add a new strength to the civil power. Though this also must be taken notice of- that princes seldom have any regard to the suffrages of ecclesiastics that are not favourers of their own faith and way of worship.

But, after all, the principal consideration, and which absolutely determines this controversy, is this: Although the magistrate's opinion in religion be sound, and the way that he appoints be truly Evangelical, yet, if I be not thoroughly persuaded thereof in my own mind, there will be no safety for me in following it. No way whatsoever that I shall walk in against the dictates of my conscience will ever bring me to the mansions of the blessed. I may grow rich by an art that I take not delight in; I may be cured of some disease by remedies that I have not faith in; but I cannot be saved by a

religion that I distrust and by a worship that I abhor. It is in vain for an unbeliever to take up the outward show of another man's profession. Faith only and inward sincerity are the things that procure acceptance with God. The most likely and most approved remedy can have no effect upon the patient, if his stomach reject it as soon as taken; and you will in vain cram a medicine down a sick man's throat, which his particular constitution will be sure to turn into poison. In a word, whatsoever may be doubtful in religion, yet this at least is certain, that no religion which I believe not to be true can be either true or profitable unto me. In vain, therefore, do princes compel their subjects to come into their Church communion, under pretence of saving their souls. If they believe, they will come of their own accord, if they believe not, their coming will nothing avail them. How great soever, in fine, may be the pretence of good-will and charity, and concern for the salvation of men's souls, men cannot be forced to be saved whether they will or no. And therefore, when all is done, they must be left to their own consciences.

Having thus at length freed men from all dominion over one another in matters of religion, let us now consider what they are to do. All men know and acknowledge that God ought to be publicly worshipped; why otherwise do they compel one another unto the public assemblies? Men, therefore, constituted in this liberty are to enter into some religious society, that they meet together, not only for mutual edification, but to own to the world that they worship God and offer unto His Divine Majesty such service as they themselves are not ashamed of and such as they think not unworthy of Him, nor unacceptable to Him; and, finally, that by the purity of doctrine, holiness of life, and decent form of worship, they may draw others unto the love of the true religion, and perform such other things in religion as cannot be done by each private man apart.

These religious societies I call Churches; and these, I say, the magistrate ought to tolerate, for the business of these assemblies of the people is nothing but what is lawful for every man in particular to take care of- I mean the salvation of their souls; nor in this case is there any difference between the National Church and other separated congregations.

But as in every Church there are two things especially to be considered- the outward form and rites of worship, and the doctrines and articles of things must be handled each distinctly that so the whole matter of toleration may the more clearly be understood.

Concerning outward worship, I say, in the first place, that the magistrate has no power to enforce by law, either in his own Church, or much less in another, the use of any rites or ceremonies whatsoever in the worship of God. And this, not only because these Churches are free societies, but because whatsoever is practised in the worship of God is only so far justifiable as it is believed by those that practise it to be acceptable unto Him. Whatsoever is not done with that assurance of faith is neither well in itself, nor can it be acceptable to God. To impose such things, therefore, upon any people, contrary to their own judgment, is in effect to command them to offend God, which, considering that the end of all religion is to please Him, and that liberty is essentially necessary to that end, appears to be absurd beyond expression.

But perhaps it may be concluded from hence that I deny unto the magistrate all manner of power about indifferent things, which, if it be not granted, the whole subject-matter of law-making is taken away. No, I readily grant that indifferent things, and perhaps none but such, are subjected to the legislative power. But it does not therefore follow that the magistrate may ordain whatsoever he pleases concerning anything that is indifferent. The public good is the rule and measure of all law-making. If a thing be not useful to the commonwealth, though it be never so indifferent, it may not presently be established by law.

And further, things never so indifferent in their own nature, when they are brought into the Church and worship of God, are removed out of the reach of the magistrate's jurisdiction, because in that use they have no connection at all with civil affairs. The only business of the Church is the salvation of souls, and it no way concerns the commonwealth, or any member of it, that this or the other ceremony be there made use of. Neither the use nor the omission of any ceremonies in those religious assemblies does either advantage or prejudice the life, liberty, or estate of any man. For example, let it be granted that the washing of an infant with water is in itself an indifferent thing, let it be granted also that the magistrate understand such washing to be profitable to the curing or preventing of any disease the children are subject unto, and esteem the matter weighty enough to be taken care of by a law. In that case he may order it to be done. But will any one therefore say that a magistrate has the same right to ordain by law that all children shall be baptised by priests in the sacred font in order to the purification of their souls? The extreme difference of these two cases is visible to every one at first sight. Or let us apply the last case to the child of a Jew, and the thing speaks itself. For what hinders but a Christian magistrate may have subjects that are Jews? Now, if we acknowledge that such an injury may not be done unto a Jew as to compel him, against his own opinion, to practise in his religion a thing that is in its nature indifferent, how can we maintain that anything of this kind may be done to a Christian?

Again, things in their own nature indifferent cannot, by any human authority, be made any part of the worship of God- for this very reason: because they are indifferent. For, since indifferent things are not capable, by any virtue of their own, to propitiate the Deity, no human power or authority can confer on them so much dignity and excellency as to enable them to do it. In the common affairs of life that use of indifferent things which God has not forbidden is free and lawful, and therefore in those things human authority has place. But it is not so in matters of religion. Things indifferent are not otherwise lawful in the worship of God than as they are instituted by God Himself and as He, by some positive command, has ordained them to be made a part of that worship which He will vouchsafe to accept at the hands of poor sinful men. Nor, when an incensed Deity shall ask us, "Who has required these, or such-like things at your hands?" will it be enough to answer Him that the magistrate commanded them. If civil jurisdiction extend thus far, what might not lawfully be introduced into religion? What hodgepodge of ceremonies, what superstitious inventions, built upon the magistrate's authority, might not (against conscience) be imposed upon the worshippers of God? For the greatest part of these ceremonies and superstitions consists in the religious use of such things as are in their own nature indifferent; nor are they sinful upon any other account than because God is not the author of them. The sprinkling of water and the use of bread and wine are both in their own nature and in the ordinary occasions of life altogether indifferent. Will any man, therefore, say that these things could have been introduced into religion and made a part of divine worship if not by divine institution? If any human authority or civil power could have done this, why might it not also enjoin the eating of fish and drinking of ale in the holy banquet as a part of divine worship? Why not the sprinkling of the blood of beasts in churches, and expiations by water or fire, and abundance more of this kind? But these things, how indifferent soever they be in common uses, when they come to be annexed unto divine worship, without divine authority, they are as abominable to God as the sacrifice of a dog. And why is a dog so abominable? What difference is there between a dog and a goat, in respect of the divine nature, equally and infinitely distant from all affinity with matter, unless it be that God required the use of one in His worship and not of the other? We see, therefore, that indifferent things, how much soever they be under the power of the civil magistrate, yet cannot, upon that

pretence, be introduced into religion and imposed upon religious assemblies, because, in the worship of God, they wholly cease to be indifferent. He that worships God does it with design to please Him and procure His favour. But that cannot be done by him who, upon the command of another, offers unto God that which he knows will be displeasing to Him, because not commanded by Himself. This is not to please God, or appease his wrath, but willingly and knowingly to provoke Him by a manifest contempt, which is a thing absolutely repugnant to the nature and end of worship.

But it will be here asked: "If nothing belonging to divine worship be left to human discretion, how is it then that Churches themselves have the power of ordering anything about the time and place of worship and the like?" To this I answer that in religious worship we must distinguish between what is part of the worship itself and what is but a circumstance. That is a part of the worship which is believed to be appointed by God and to be well-pleasing to Him, and therefore that is necessary. Circumstances are such things which, though in general they cannot be separated from worship, yet the particular instances or modifications of them are not determined, and therefore they are indifferent. Of this sort are the time and place of worship, habit and posture of him that worships. These are circumstances, and perfectly indifferent, where God has not given any express command about them. For example: amongst the Jews the time and place of their worship and the habits of those that officiated in it were not mere circumstances, but a part of the worship itself, in which, if anything were defective, or different from the institution, they could not hope that it would be accepted by God. But these, to Christians under the liberty of the Gospel, are mere circumstances of worship, which the prudence of every Church may bring into such use as shall be judged most subservient to the end of order, decency, and edification. But, even under the Gospel, those who believe the first or the seventh day to be set apart by God, and consecrated still to His worship, to them that portion of time is not a simple circumstance, but a real part of Divine worship, which can neither be changed nor neglected.

In the next place: As the magistrate has no power to impose by his laws the use of any rites and ceremonies in any Church, so neither has he any power to forbid the use of such rites and ceremonies as are already received, approved, and practised by any Church; because, if he did so, he would destroy the Church itself: the end of whose institution is only to worship God with freedom after its own manner.

You will say, by this rule, if some congregations should have a mind to sacrifice infants, or (as the primitive Christians were falsely accused) lustfully pollute themselves in promiscuous uncleanness, or practise any other such heinous enormities, is the magistrate obliged to tolerate them, because they are committed in a religious assembly? I answer: No. These things are not lawful in the ordinary course of life, nor in any private house; and therefore neither are they so in the worship of God, or in any religious meeting. But, indeed, if any people congregated upon account of religion should be desirous to sacrifice a calf, I deny that that ought to be prohibited by a law. Meliboeus, whose calf it is, may lawfully kill his calf at home, and burn any part of it that he thinks fit. For no injury is thereby done to any one, no prejudice to another man's goods. And for the same reason he may kill his calf also in a religious meeting. Whether the doing so be well-pleasing to God or no, it is their part to consider that do it. The part of the magistrate is only to take care that the commonwealth receive no prejudice, and that there be no injury done to any man, either in life or estate. And thus what may be spent on a feast may be spent on a sacrifice. But if peradventure such were the state of things that the interest of the commonwealth required all slaughter of beasts should be forborne for some while, in order to the increasing of the stock of cattle that had been

destroyed by some extraordinary murrain, who sees not that the magistrate, in such a case, may forbid all his subjects to kill any calves for any use whatsoever? Only it is to be observed that, in this case, the law is not made about a religious, but a political matter; nor is the sacrifice, but the slaughter of calves, thereby prohibited.

By this we see what difference there is between the Church and the Commonwealth. Whatsoever is lawful in the Commonwealth cannot be prohibited by the magistrate in the Church. Whatsoever is permitted unto any of his subjects for their ordinary use, neither can nor ought to be forbidden by him to any sect of people for their religious uses. If any man may lawfully take bread or wine, either sitting or kneeling in his own house, the law ought not to abridge him of the same liberty in his religious worship; though in the Church the use of bread and wine be very different and be there applied to the mysteries of faith and rites of Divine worship. But those things that are prejudicial to the commonweal of a people in their ordinary use and are, therefore, forbidden by laws, those things ought not to be permitted to Churches in their sacred rites. Only the magistrate ought always to be very careful that he do not misuse his authority to the oppression of any Church, under pretence of public good.

It may be said: "What if a Church be idolatrous, is that also to be tolerated by the magistrate?" I answer: What power can be given to the magistrate for the suppression of an idolatrous Church, which may not in time and place be made use of to the ruin of an orthodox one? For it must be remembered that the civil power is the same everywhere, and the religion of every prince is orthodox to himself. If, therefore, such a power be granted unto the civil magistrate in spirituals as that at Geneva, for example, he may extirpate, by violence and blood, the religion which is there reputed idolatrous, by the same rule another magistrate, in some neighbouring country, may oppress the reformed religion and, in India, the Christian. The civil power can either change everything in religion, according to the prince's pleasure, or it can change nothing. If it be once permitted to introduce anything into religion by the means of laws and penalties, there can be no bounds put to it; but it will in the same manner be lawful to alter everything, according to that rule of truth which the magistrate has framed unto himself. No man whatsoever ought, therefore, to be deprived of his terrestrial enjoyments upon account of his religion. Not even Americans, subjected unto a Christian prince, are to be punished either in body or goods for not embracing our faith and worship. If they are persuaded that they please God in observing the rites of their own country and that they shall obtain happiness by that means, they are to be left unto God and themselves. Let us trace this matter to the bottom. Thus it is: An inconsiderable and weak number of Christians, destitute of everything, arrive in a Pagan country; these foreigners beseech the inhabitants, by the bowels of humanity, that they would succour them with the necessaries of life; those necessaries are given them, habitations are granted, and they all join together, and grow up into one body of people. The Christian religion by this means takes root in that country and spreads itself, but does not suddenly grow the strongest. While things are in this condition peace, friendship, faith, and equal justice are preserved amongst them. At length the magistrate becomes a Christian, and by that means their party becomes the most powerful. Then immediately all compacts are to be broken, all civil rights to be violated, that idolatry may be extirpated; and unless these innocent Pagans, strict observers of the rules of equity and the law of Nature and no ways offending against the laws of the society, I say, unless they will forsake their ancient religion and embrace a new and strange one, they are to be turned out of the lands and possessions of their forefathers and perhaps deprived of life itself. Then, at last, it appears what zeal for the Church, joined with the desire of dominion, is capable to produce, and how easily the pretence of religion, and of the care of souls,

serves for a cloak to covetousness, rapine, and ambition.

Now whosoever maintains that idolatry is to be rooted out of any place by laws, punishments, fire, and sword, may apply this story to himself. For the reason of the thing is equal, both in America and Europe. And neither Pagans there, nor any dissenting Christians here, can, with any right, be deprived of their worldly goods by the predominating faction of a court-church; nor are any civil rights to be either changed or violated upon account of religion in one place more than another.

But idolatry, say some, is a sin and therefore not to be tolerated. If they said it were therefore to be avoided, the inference were good. But it does not follow that because it is a sin it ought therefore to be punished by the magistrate. For it does not belong unto the magistrate to make use of his sword in punishing everything, indifferently, that he takes to be a sin against God. Covetousness, uncharitableness, idleness, and many other things are sins by the consent of men, which yet no man ever said were to be punished by the magistrate. The reason is because they are not prejudicial to other men's rights, nor do they break the public peace of societies. Nay, even the sins of lying and perjury are nowhere punishable by laws; unless, in certain cases, in which the real turpitude of the thing and the offence against God are not considered, but only the injury done unto men's neighbours and to the commonwealth. And what if in another country, to a Mahometan or a Pagan prince, the Christian religion seem false and offensive to God; may not the Christians for the same reason, and after the same manner, be extirpated there?

But it may be urged farther that, by the law of Moses, idolaters were to be rooted out. True, indeed, by the law of Moses; but that is not obligatory to us Christians. Nobody pretends that everything generally enjoined by the law of Moses ought to be practised by Christians; but there is nothing more frivolous than that common distinction of moral, judicial, and ceremonial law, which men ordinarily make use of. For no positive law whatsoever can oblige any people but those to whom it is given. "Hear, O Israel," sufficiently restrains the obligations of the law of Moses only to that people. And this consideration alone is answer enough unto those that urge the authority of the law of Moses for the inflicting of capital punishment upon idolaters. But, however, I will examine this argument a little more particularly.

The case of idolaters, in respect of the Jewish commonwealth, falls under a double consideration. The first is of those who, being initiated in the Mosaical rites, and made citizens of that commonwealth, did afterwards apostatise from the worship of the God of Israel. These were proceeded against as traitors and rebels, guilty of no less than high treason. For the commonwealth of the Jews, different in that from all others, was an absolute theocracy; nor was there, or could there be, any difference between that commonwealth and the Church. The laws established there concerning the worship of One Invisible Deity were the civil laws of that people and a part of their political government, in which God Himself was the legislator. Now, if any one can shew me where there is a commonwealth at this time, constituted upon that foundation, I will acknowledge that the ecclesiastical laws do there unavoidably become a part of the civil, and that the subjects of that government both may and ought to be kept in strict conformity with that Church by the civil power. But there is absolutely no such thing under the Gospel as a Christian commonwealth. There are, indeed, many cities and kingdoms that have embraced the faith of Christ, but they have retained their ancient form of government, with which the law of Christ hath not at all meddled. He, indeed, hath taught men how, by faith and good works, they may obtain eternal life; but He instituted no commonwealth. He prescribed unto His followers no new and peculiar form of government, nor put He the sword into any magistrate's hand, with commission to make use of it in forcing men to forsake their former religion and receive His.

Secondly, foreigners and such as were strangers to the commonwealth of Israel were not compelled by force to observe the rites of the Mosaical law; but, on the contrary, in the very same place where it is ordered that an Israelite that was an idolater should be put to death (Exod. 22, 20, 21), there it is provided that strangers should not be vexed nor oppressed. I confess that the seven nations that possessed the land which was promised to the Israelites were utterly to be cut off; but this was not singly because they were idolaters. For if that had been the reason, why were the Moabites and other nations to be spared? No: the reason is this. God being in a peculiar manner the King of the Jews, He could not suffer the adoration of any other deity (which was properly an act of high treason against Himself) in the land of Canaan, which was His kingdom. For such a manifest revolt could no ways consist with His dominion, which was perfectly political in that country. All idolatry was, therefore, to be rooted out of the bounds of His kingdom because it was an acknowledgment of another god, that is say, another king, against the laws of Empire. The inhabitants were also to be driven out, that the entire possession of the land might be given to the Israelites. And for the like reason the Emims and the Horims were driven out of their countries by the children of Esau and Lot; and their lands, upon the same grounds, given by God to the invaders (Deut. 2). But, though all idolatry was thus rooted out of the land of Canaan, yet every idolater was not brought to execution. The whole family of Rahab, the whole nation of the Gibeonites, articled with Joshua, and were allowed by treaty; and there were many captives amongst the Jews who were idolaters. David and Solomon subdued many countries without the confines of the Land of Promise and carried their conquests as far as Euphrates. Amongst so many captives taken, so many nations reduced under their obedience, we find not one man forced into the Jewish religion and the worship of the true God and punished for idolatry, though all of them were certainly guilty of it. If any one, indeed, becoming a proselyte, desired to be made a denizen of their commonwealth, he was obliged to submit to their laws; that is, to embrace their religion. But this he did willingly, on his own accord, not by constraint. He did not unwillingly submit, to show his obedience, but he sought and solicited for it as a privilege. And, as soon as he was admitted, he became subject to the laws of the commonwealth, by which all idolatry was forbidden within the borders of the land of Canaan. But that law (as I have said) did not reach to any of those regions, however subjected unto the Jews, that were situated without those bounds.

Thus far concerning outward worship. Let us now consider articles of faith.

The articles of religion are some of them practical and some speculative. Now, though both sorts consist in the knowledge of truth, yet these terminate simply in the understanding, those influence the will and manners. Speculative opinions, therefore, and articles of faith (as they are called) which are required only to be believed, cannot be imposed on any Church by the law of the land. For it is absurd that things should be enjoined by laws which are not in men's power to perform. And to believe this or that to be true does not depend upon our will. But of this enough has been said already. "But." will some say; "let men at least profess that they believe." A sweet religion, indeed, that obliges men to dissemble and tell lies, both to God and man, for the salvation of their souls! If the magistrate thinks to save men thus, he seems to understand little of the way of salvation. And if he does it not in order to save them, why is he so solicitous about the articles of faith as to enact them by a law?

Further, the magistrate ought not to forbid the preaching or professing of any speculative opinions in any Church because they have no manner of relation to the civil rights of the subjects. If a Roman Catholic believe that to be really the body of Christ which another man calls bread, he does no injury thereby to his neighbour. If a Jew do not believe the New Testament to be the Word of

God, he does not thereby alter anything in men's civil rights. If a heathen doubt of both Testaments, he is not therefore to be punished as a pernicious citizen. The power of the magistrate and the estates of the people may be equally secure whether any man believe these things or no. I readily grant that these opinions are false and absurd. But the business of laws is not to provide for the truth of opinions, but for the safety and security of the commonwealth and of every particular man's goods and person. And so it ought to be. For the truth certainly would do well enough if she were once left to shift for herself. She seldom has received and, I fear, never will receive much assistance from the power of great men, to whom she is but rarely known and more rarely welcome. She is not taught by laws, nor has she any need of force to procure her entrance into the minds of men. Errors, indeed, prevail by the assistance of foreign and borrowed succours. But if Truth makes not her way into the understanding by her own light, she will be but the weaker for any borrowed force violence can add to her. Thus much for speculative opinions. Let us now proceed to practical ones.

A good life, in which consist not the least part of religion and true piety, concerns also the civil government; and in it lies the safety both of men's souls and of the commonwealth. Moral actions belong, therefore, to the jurisdiction both of the outward and inward court; both of the civil and domestic governor; I mean both of the magistrate and conscience. Here, therefore, is great danger, lest one of these jurisdictions intrench upon the other, and discord arise between the keeper of the public peace and the overseers of souls. But if what has been already said concerning the limits of both these governments be rightly considered, it will easily remove all difficulty in this matter.

Every man has an immortal soul, capable of eternal happiness or misery; whose happiness depending upon his believing and doing those things in this life which are necessary to the obtaining of God's favour, and are prescribed by God to that end. It follows from thence, first, that the observance of these things is the highest obligation that lies upon mankind and that our utmost care, application, and diligence ought to be exercised in the search and performance of them; because there is nothing in this world that is of any consideration in comparison with eternity. Secondly, that seeing one man does not violate the right of another by his erroneous opinions and undue manner of worship, nor is his perdition any prejudice to another man's affairs, therefore, the care of each man's salvation belongs only to himself. But I would not have this understood as if I meant hereby to condemn all charitable admonitions and affectionate endeavours to reduce men from errors, which are indeed the greatest duty of a Christian. Any one may employ as many exhortations and arguments as he pleases, towards the promoting of another man's salvation. But all force and compulsion are to be forborne. Nothing is to be done imperiously. Nobody is obliged in that matter to yield obedience unto the admonitions or injunctions of another, further than he himself is persuaded. Every man in that has the supreme and absolute authority of judging for himself. And the reason is because nobody else is concerned in it, nor can receive any prejudice from his conduct therein.

But besides their souls, which are immortal, men have also their temporal lives here upon earth; the state whereof being frail and fleeting, and the duration uncertain, they have need of several outward conveniences to the support thereof, which are to be procured or preserved by pains and industry. For those things that are necessary to the comfortable support of our lives are not the spontaneous products of nature, nor do offer themselves fit and prepared for our use. This part, therefore, draws on another care and necessarily gives another employment. But the pravity of mankind being such that they had rather injuriously prey upon the fruits of other men's labours than take pains to provide for themselves, the necessity of preserving men in the possession of what

honest industry has already acquired and also of preserving their liberty and strength, whereby they may acquire what they farther want, obliges men to enter into society with one another, that by mutual assistance and joint force they may secure unto each other their properties, in the things that contribute to the comfort and happiness of this life, leaving in the meanwhile to every man the care of his own eternal happiness, the attainment whereof can neither be facilitated by another man's industry, nor can the loss of it turn to another man's prejudice, nor the hope of it be forced from him by any external violence. But, forasmuch as men thus entering into societies, grounded upon their mutual compacts of assistance for the defence of their temporal goods, may, nevertheless, be deprived of them, either by the rapine and fraud of their fellow citizens, or by the hostile violence of foreigners, the remedy of this evil consists in arms, riches, and multitude of citizens; the remedy of the other in laws; and the care of all things relating both to one and the other is committed by the society to the civil magistrate. This is the original, this is the use, and these are the bounds of the legislative (which is the supreme) power in every commonwealth. I mean that provision may be made for the security of each man's private possessions; for the peace, riches, and public commodities of the whole people; and, as much as possible, for the increase of their inward strength against foreign invasions.

These things being thus explained, it is easy to understand to what end the legislative power ought to be directed and by what measures regulated; and that is the temporal good and outward prosperity of the society; which is the sole reason of men's entering into society, and the only thing they seek and aim at in it. And it is also evident what liberty remains to men in reference to their eternal salvation, and that is that every one should do what he in his conscience is persuaded to be acceptable to the Almighty, on whose good pleasure and acceptance depends their eternal happiness. For obedience is due, in the first place, to God and, afterwards to the laws.

But some may ask: "What if the magistrate should enjoin anything by his authority that appears unlawful to the conscience of a private person?" I answer that, if government be faithfully administered and the counsels of the magistrates be indeed directed to the public good, this will seldom happen. But if, perhaps, it do so fall out, I say, that such a private person is to abstain from the action that he judges unlawful, and he is to undergo the punishment which it is not unlawful for him to bear. For the private judgement of any person concerning a law enacted in political matters, for the public good, does not take away the obligation of that law, nor deserve a dispensation. But if the law, indeed, be concerning things that lie not within the verge of the magistrate's authority (as, for example, that the people, or any party amongst them, should be compelled to embrace a strange religion, and join in the worship and ceremonies of another Church), men are not in these cases obliged by that law, against their consciences. For the political society is instituted for no other end, but only to secure every man's possession of the things of this life. The care of each man's soul and of the things of heaven, which neither does belong to the commonwealth nor can be subjected to it, is left entirely to every man's self. Thus the safeguard of men's lives and of the things that belong unto this life is the business of the commonwealth; and the preserving of those things unto their owners is the duty of the magistrate. And therefore the magistrate cannot take away these worldly things from this man or party and give them to that; nor change propriety amongst fellow subjects (no not even by a law), for a cause that has no relation to the end of civil government, I mean for their religion, which whether it be true or false does no prejudice to the worldly concerns of their fellow subjects, which are the things that only belong unto the care of the commonwealth.

But what if the magistrate believe such a law as this to be for the public good? I answer: As the

private judgement of any particular person, if erroneous, does not exempt him from the obligation of law, so the private judgement (as I may call it) of the magistrate does not give him any new right of imposing laws upon his subjects, which neither was in the constitution of the government granted him, nor ever was in the power of the people to grant, much less if he make it his business to enrich and advance his followers and fellow-sectaries with the spoils of others. But what if the magistrate believe that he has a right to make such laws and that they are for the public good, and his subjects believe the contrary? Who shall be judge between them? I answer: God alone. For there is no judge upon earth between the supreme magistrate and the people. God, I say, is the only judge in this case, who will retribute unto every one at the last day according to his deserts; that is, according to his sincerity and uprightness in endeavouring to promote piety, and the public weal, and peace of mankind. But What shall be done in the meanwhile? I answer: The principal and chief care of every one ought to be of his own soul first, and, in the next place, of the public peace; though yet there are very few will think it is peace there, where they see all laid waste.

There are two sorts of contests amongst men, the one managed by law, the other by force; and these are of that nature that where the one ends, the other always begins. But it is not my business to inquire into the power of the magistrate in the different constitutions of nations. I only know what usually happens where controversies arise without a judge to determine them. You will say, then, the magistrate being the stronger will have his will and carry his point. Without doubt; but the question is not here concerning the doubtfulness of the event, but the rule of right.

But to come to particulars. I say, first, no opinions contrary to human society, or to those moral rules which are necessary to the preservation of civil society, are to be tolerated by the magistrate. But of these, indeed, examples in any Church are rare. For no sect can easily arrive to such a degree of madness as that it should think fit to teach, for doctrines of religion, such things as manifestly undermine the foundations of society and are, therefore, condemned by the judgement of all mankind; because their own interest, peace, reputation, everything would be thereby endangered.

Another more secret evil, but more dangerous to the commonwealth, is when men arrogate to themselves, and to those of their own sect, some peculiar prerogative covered over with a specious show of deceitful words, but in effect opposite to the civil right of the community. For example: we cannot find any sect that teaches, expressly and openly, that men are not obliged to keep their promise; that princes may be dethroned by those that differ from them in religion; or that the dominion of all things belongs only to themselves. For these things, proposed thus nakedly and plainly, would soon draw on them the eye and hand of the magistrate and awaken all the care of the commonwealth to a watchfulness against the spreading of so dangerous an evil. But, nevertheless, we find those that say the same things in other words. What else do they mean who teach that faith is not to be kept with heretics? Their meaning, forsooth, is that the privilege of breaking faith belongs unto themselves; for they declare all that are not of their communion to be heretics, or at least may declare them so whensoever they think fit. What can be the meaning of their asserting that kings excommunicated forfeit their crowns and kingdoms? It is evident that they thereby arrogate unto themselves the power of deposing kings, because they challenge the power of excommunication, as the peculiar right of their hierarchy. That dominion is founded in grace is also an assertion by which those that maintain it do plainly lay claim to the possession of all things. For they are not so wanting to themselves as not to believe, or at least as not to profess themselves to be the truly pious and faithful. These, therefore, and the like, who attribute unto the faithful, religious, and orthodox, that is, in plain terms, unto themselves, any peculiar privilege or

power above other mortals, in civil concernments; or who upon pretence of religion do challenge any manner of authority over such as are not associated with them in their ecclesiastical communion, I say these have no right to be tolerated by the magistrate; as neither those that will not own and teach the duty of tolerating all men in matters of mere religion. For what do all these and the like doctrines signify, but that they may and are ready upon any occasion to seize the Government and possess themselves of the estates and fortunes of their fellow subjects; and that they only ask leave to be tolerated by the magistrate so long until they find themselves strong enough to effect it?

Again: That Church can have no right to be tolerated by the magistrate which is constituted upon such a bottom that all those who enter into it do thereby ipso facto deliver themselves up to the protection and service of another prince. For by this means the magistrate would give way to the settling of a foreign jurisdiction in his own country and suffer his own people to be listed, as it were, for soldiers against his own Government. Nor does the frivolous and fallacious distinction between the Court and the Church afford any remedy to this inconvenience; especially when both the one and the other are equally subject to the absolute authority of the same person, who has not only power to persuade the members of his Church to whatsoever he lists, either as purely religious, or in order thereunto, but can also enjoin it them on pain of eternal fire. It is ridiculous for any one to profess himself to be a Mahometan only in his religion, but in everything else a faithful subject to a Christian magistrate, whilst at the same time he acknowledges himself bound to yield blind obedience to the Mufti of Constantinople, who himself is entirely obedient to the Ottoman Emperor and frames the feigned oracles of that religion according to his pleasure. But this Mahometan living amongst Christians would yet more apparently renounce their government if he acknowledged the same person to be head of his Church who is the supreme magistrate in the state.

Lastly, those are not at all to be tolerated who deny the being of a God. Promises, covenants, and oaths, which are the bonds of human society, can have no hold upon an atheist. The taking away of God, though but even in thought, dissolves all; besides also, those that by their atheism undermine and destroy all religion, can have no pretence of religion whereupon to challenge the privilege of a toleration. As for other practical opinions, though not absolutely free from all error, if they do not tend to establish domination over others, or civil impunity to the Church in which they are taught, there can be no reason why they should not be tolerated.

It remains that I say something concerning those assemblies which, being vulgarly called and perhaps having sometimes been conventicles and nurseries of factions and seditions, are thought to afford against this doctrine of toleration. But this has not happened by anything peculiar unto the genius of such assemblies, but by the unhappy circumstances of an oppressed or ill-settled liberty. These accusations would soon cease if the law of toleration were once so settled that all Churches were obliged to lay down toleration as the foundation of their own liberty, and teach that liberty of conscience is every man's natural right, equally belonging to dissenters as to themselves; and that nobody ought to be compelled in matters of religion either by law or force. The establishment of this one thing would take away all ground of complaints and tumults upon account of conscience; and these causes of discontents and animosities being once removed, there would remain nothing in these assemblies that were not more peaceable and less apt to produce disturbance of state than in any other meetings whatsoever. But let us examine particularly the heads of these accusations.

You will say that assemblies and meetings endanger the public peace and threaten the commonwealth. I answer: If this be so, why are there daily such numerous meetings in markets

and Courts of Judicature? Why are crowds upon the Exchange and a concourse of people in cities suffered? You will reply: "Those are civil assemblies, but these we object against are ecclesiastical." I answer: It is a likely thing, indeed, that such assemblies as are altogether remote from civil affairs should be most apt to embroil them. Oh, but civil assemblies are composed of men that differ from one another in matters of religion, but these ecclesiastical meetings are of persons that are all of one opinion. As if an agreement in matters of religion were in effect a conspiracy against the commonwealth; or as if men would not be so much the more warmly unanimous in religion the less liberty they had of assembling. But it will be urged still that civil assemblies are open and free for any one to enter into, whereas religious conventicles are more private and thereby give opportunity to clandestine machinations. I answer that this is not strictly true, for many civil assemblies are not open to everyone. And if some religious meetings be private, who are they (I beseech you) that are to be blamed for it, those that desire, or those that forbid their being public! Again, you will say that religious communion does exceedingly unite men's minds and affections to one another and is therefore the more dangerous. But if this be so, why is not the magistrate afraid of his own Church; and why does he not forbid their assemblies as things dangerous to his Government? You will say because he himself is a part and even the head of them. As if he were not also a part of the commonwealth, and the head of the whole people!

Let us therefore deal plainly. The magistrate is afraid of other Churches, but not of his own, because he is kind and favourable to the one, but severe and cruel to the other. These he treats like children, and indulges them even to wantonness. Those he uses as slaves and, how blamelessly soever they demean themselves, recompenses them no otherwise than by galleys, prisons, confiscations, and death. These he cherishes and defends; those he continually scourges and oppresses. Let him turn the tables. Or let those dissenters enjoy but the same privileges in civils as his other subjects, and he will quickly find that these religious meetings will be no longer dangerous. For if men enter into seditious conspiracies, it is not religion inspires them to it in their meetings, but their sufferings and oppressions that make them willing to ease themselves. Just and moderate governments are everywhere quiet, everywhere safe; but oppression raises ferments and makes men struggle to cast off an uneasy and tyrannical yoke. I know that seditions are very frequently raised upon pretence of religion, but it is as true that for religion subjects are frequently ill treated and live miserably. Believe me, the stirs that are made proceed not from any peculiar temper of this or that Church or religious society, but from the common disposition of all mankind, who when they groan under any heavy burthen endeavour naturally to shake off the yoke that galls their necks. Suppose this business of religion were let alone, and that there were some other distinction made between men and men upon account of their different complexions, shapes, and features, so that those who have black hair (for example) or grey eyes should not enjoy the same privileges as other citizens; that they should not be permitted either to buy or sell, or live by their callings; that parents should not have the government and education of their own children; that all should either be excluded from the benefit of the laws, or meet with partial judges; can it be doubted but these persons, thus distinguished from others by the colour of their hair and eyes, and united together by one common persecution, would be as dangerous to the magistrate as any others that had associated themselves merely upon the account of religion? Some enter into company for trade and profit, others for want of business have their clubs for claret. Neighbourhood joins some and religion others. But there is only one thing which gathers people into seditious commotions, and that is oppression.

You will say "What, will you have people to meet at divine service against the magistrate's will?" I

answer: Why, I pray, against his will? Is it not both lawful and necessary that they should meet? Against his will, do you say? That is what I complain of; that is the very root of all the mischief. Why are assemblies less sufferable in a church than in a theatre or market? Those that meet there are not either more vicious or more turbulent than those that meet elsewhere. The business in that is that they are ill used, and therefore they are not to be suffered. Take away the partiality that is used towards them in matters of common right; change the laws, take away the penalties unto which they are subjected, and all things will immediately become safe and peaceable; nay, those that are averse to the religion of the magistrate will think themselves so much the more bound to maintain the peace of the commonwealth as their condition is better in that place than elsewhere; and all the several separate congregations, like so many guardians of the public peace, will watch one another, that nothing may be innovated or changed in the form of the government, because they can hope for nothing better than what they already enjoy- that is, an equal condition with their fellow-subjects under a just and moderate government. Now if that Church which agrees in religion with the prince be esteemed the chief support of any civil government, and that for no other reason (as has already been shown) than because the prince is kind and the laws are favourable to it, how much greater will be the security of government where all good subjects, of whatsoever Church they be, without any distinction upon account of religion, enjoying the same favour of the prince and the same benefit of the laws, shall become the common support and guard of it, and where none will have any occasion to fear the severity of the laws but those that do injuries to their neighbours and offend against the civil peace?

That we may draw towards a conclusion. The sum of all we drive at is that every man may enjoy the same rights that are granted to others. Is it permitted to worship God in the Roman manner? Let it be permitted to do it in the Geneva form also. Is it permitted to speak Latin in the market-place? Let those that have a mind to it be permitted to do it also in the Church. Is it lawful for any man in his own house to kneel, stand, sit, or use any other posture; and to clothe himself in white or black, in short or in long garments? Let it not be made unlawful to eat bread, drink wine, or wash with water in the church. In a word, whatsoever things are left free by law in the common occasions of life, let them remain free unto every Church in divine worship. Let no man's life, or body, or house, or estate, suffer any manner of prejudice upon these accounts. Can you allow of the Presbyterian discipline? Why should not the Episcopal also have what they like? Ecclesiastical authority, whether it be administered by the hands of a single person or many, is everywhere the same; and neither has any jurisdiction in things civil, nor any manner of power of compulsion, nor anything at all to do with riches and revenues.

Ecclesiastical assemblies and sermons are justified by daily experience and public allowance. These are allowed to people of some one persuasion; why not to all? If anything pass in a religious meeting seditiously and contrary to the public peace, it is to be punished in the same manner and no otherwise than as if it had happened in a fair or market. These meetings ought not to be sanctuaries for factious and flagitious fellows. Nor ought it to be less lawful for men to meet in churches than in halls; nor are one part of the subjects to be esteemed more blamable for their meeting together than others. Every one is to be accountable for his own actions, and no man is to be laid under a suspicion or odium for the fault of another. Those that are seditious, murderers, thieves, robbers, adulterers, slanderers, etc., of whatsoever Church, whether national or not, ought to be punished and suppressed. But those whose doctrine is peaceable and whose manners are pure and blameless ought to be upon equal terms with their fellow-subjects. Thus if solemn assemblies, observations of festivals, public worship be permitted to any one sort of professors, all these things

ought to be permitted to the Presbyterians, Independents, Anabaptists, Arminians, Quakers, and others, with the same liberty. Nay, if we may openly speak the truth, and as becomes one man to another, neither Pagan nor Mahometan, nor Jew, ought to be excluded from the civil rights of the commonwealth because of his religion. The Gospel commands no such thing. The Church which "judgeth not those that are without" (I Cor. 5. 12, 13) wants it not. And the commonwealth, which embraces indifferently all men that are honest, peaceable, and industrious, requires it not. Shall we suffer a Pagan to deal and trade with us, and shall we not suffer him to pray unto and worship God? If we allow the Jews to have private houses and dwellings amongst us, why should we not allow them to have synagogues? Is their doctrine more false, their worship more abominable, or is the civil peace more endangered by their meeting in public than in their private houses? But if these things may be granted to Jews and Pagans, surely the condition of any Christians ought not to be worse than theirs in a Christian commonwealth.

You will say, perhaps: "Yes, it ought to be; because they are more inclinable to factions, tumults, and civil wars." I answer: Is this the fault of the Christian religion? If it be so, truly the Christian religion is the worst of all religions and ought neither to be embraced by any particular person, nor tolerated by any commonwealth. For if this be the genius, this the nature of the Christian religion, to be turbulent and destructive to the civil peace, that Church itself which the magistrate indulges will not always be innocent. But far be it from us to say any such thing of that religion which carries the greatest opposition to covetousness, ambition, discord, contention, and all manner of inordinate desires, and is the most modest and peaceable religion that ever was. We must, therefore, seek another cause of those evils that are charged upon religion. And, if we consider right, we shall find it to consist wholly in the subject that I am treating of. It is not the diversity of opinions (which cannot be avoided), but the refusal of toleration to those that are of different opinions (which might have been granted), that has produced all the bustles and wars that have been in the Christian world upon account of religion. The heads and leaders of the Church, moved by avarice and insatiable desire of dominion, making use of the immoderate ambition of magistrates and the credulous superstition of the giddy multitude, have incensed and animated them against those that dissent from themselves, by preaching unto them, contrary to the laws of the Gospel and to the precepts of charity, that schismatics and heretics are to be outed of their possessions and destroyed. And thus have they mixed together and confounded two things that are in themselves most different, the Church and the commonwealth. Now as it is very difficult for men patiently to suffer themselves to be stripped of the goods which they have got by their honest industry, and, contrary to all the laws of equity, both human and divine, to be delivered up for a prey to other men's violence and rapine; especially when they are otherwise altogether blameless; and that the occasion for which they are thus treated does not at all belong to the jurisdiction of the magistrate, but entirely to the conscience of every particular man for the conduct of which he is accountable to God only; what else can be expected but that these men, growing weary of the evils under which they labour, should in the end think it lawful for them to resist force with force, and to defend their natural rights (which are not forfeitable upon account of religion) with arms as well as they can? That this has been hitherto the ordinary course of things is abundantly evident in history, and that it will continue to be so hereafter is but too apparent in reason. It cannot indeed, be otherwise so long as the principle of persecution for religion shall prevail, as it has done hitherto, with magistrate and people, and so long as those that ought to be the preachers of peace and concord shall continue with all their art and strength to excite men to arms and sound the trumpet of war. But that magistrates should thus suffer these incendiaries and disturbers of the

public peace might justly be wondered at if it did not appear that they have been invited by them unto a participation of the spoil, and have therefore thought fit to make use of their covetousness and pride as means whereby to increase their own power. For who does not see that these good men are, indeed, more ministers of the government than ministers of the Gospel and that, by flattering the ambition and favouring the dominion of princes and men in authority, they endeavour with all their might to promote that tyranny in the commonwealth which otherwise they should not be able to establish in the Church? This is the unhappy agreement that we see between the Church and State. Whereas if each of them would contain itself within its own bounds- the one attending to the worldly welfare of the commonwealth, the other to the salvation of souls- it is impossible that any discord should ever have happened between them. Sed pudet hoec opprobria. etc. God Almighty grant, I beseech Him, that the gospel of peace may at length be preached, and that civil magistrates, growing more careful to conform their own consciences to the law of God and less solicitous about the binding of other men's consciences by human laws, may, like fathers of their country, direct all their counsels and endeavours to promote universally the civil welfare of all their children, except only of such as are arrogant, ungovernable, and injurious to their brethren; and that all ecclesiastical men, who boast themselves to be the successors of the Apostles, walking peaceably and modestly in the Apostles' steps, without intermeddling with State Affairs, may apply themselves wholly to promote the salvation of souls.

FAREWELL.

PERHAPS it may not be amiss to add a few things concerning heresy and schism. A Turk is not, nor can be, either heretic or schismatic to a Christian; and if any man fall off from the Christian faith to Mahometism, he does not thereby become a heretic or schismatic, but an apostate and an infidel. This nobody doubts of; and by this it appears that men of different religions cannot be heretics or schismatics to one another.

We are to inquire, therefore, what men are of the same religion. Concerning which it is manifest that those who have one and the same rule of faith and worship are of the same religion; and those who have not the same rule of faith and worship are of different religions. For since all things that belong unto that religion are contained in that rule, it follows necessarily that those who agree in one rule are of one and the same religion, and vice versa. Thus Turks and Christians are of different religions, because these take the Holy Scriptures to be the rule of their religion, and those the Alcoran. And for the same reason there may be different religions also even amongst Christians. The Papists and Lutherans, though both of them profess faith in Christ and are therefore called Christians, yet are not both of the same religion, because these acknowledge nothing but the Holy Scriptures to be the rule and foundation of their religion, those take in also traditions and the decrees of Popes and of these together make the rule of their religion; and thus the Christians of St. John (as they are called) and the Christians of Geneva are of different religions, because these also take only the Scriptures, and those I know not what traditions, for the rule of their religion.

This being settled, it follows, first, that heresy is a separation made in ecclesiastical communion between men of the same religion for some opinions no way contained in the rule itself; and, secondly, that amongst those who acknowledge nothing but the Holy Scriptures to be their rule of faith, heresy is a separation made in their Christian communion for opinions not contained in the express words of Scripture. Now this separation may be made in a twofold manner:

1. When the greater part, or by the magistrate's patronage the stronger part, of the Church

separates itself from others by excluding them out of her communion because they will not profess their belief of certain opinions which are not the express words of the Scripture. For it is not the paucity of those that are separated, nor the authority of the magistrate, that can make any man guilty of heresy, but he only is a heretic who divides the Church into parts, introduces names and marks of distinction, and voluntarily makes a separation because of such opinions.

2. When any one separates himself from the communion of a Church because that Church does not publicly profess some certain opinions which the Holy Scriptures do not expressly teach.

Both these are heretics because they err in fundamentals, and they err obstinately against knowledge; for when they have determined the Holy Scriptures to be the only foundation of faith, they nevertheless lay down certain propositions as fundamental which are not in the Scripture, and because others will not acknowledge these additional opinions of theirs, nor build upon them as if they were necessary and fundamental, they therefore make a separation in the Church, either by withdrawing themselves from others, or expelling the others from them. Nor does it signify anything for them to say that their confessions and symbols are agreeable to Scripture and to the analogy of faith; for if they be conceived in the express words of Scripture, there can be no question about them, because those things are acknowledged by all Christians to be of divine inspiration and therefore fundamental. But if they say that the articles which they require to be professed are consequences deduced from the Scripture, it is undoubtedly well done of them who believe and profess such things as seem unto them so agreeable to the rule of faith. But it would be very ill done to obtrude those things upon others unto whom they do not seem to be the indubitable doctrines of the Scripture; and to make a separation for such things as these, which neither are nor can be fundamental, is to become heretics; for I do not think there is any man arrived to that degree of madness as that he dare give out his consequences and interpretations of Scripture as divine inspirations and compare the articles of faith that he has framed according to his own fancy with the authority of Scripture. I know there are some propositions so evidently agreeable to Scripture that nobody can deny them to be drawn from thence, but about those, therefore, there can be no difference. This only I say- that however clearly we may think this or the other doctrine to be deduced from Scripture, we ought not therefore to impose it upon others as a necessary article of faith because we believe it to be agreeable to the rule of faith, unless we would be content also that other doctrines should be imposed upon us in the same manner, and that we should be compelled to receive and profess all the different and contradictory opinions of Lutherans, Calvinists, Remonstrants, Anabaptists, and other sects which the contrivers of symbols, systems, and confessions are accustomed to deliver to their followers as genuine and necessary deductions from the Holy Scripture. I cannot but wonder at the extravagant arrogance of those men who think that they themselves can explain things necessary to salvation more clearly than the Holy Ghost, the eternal and infinite wisdom of God.

Thus much concerning heresy, which word in common use is applied only to the doctrinal part of religion. Let us now consider schism, which is a crime near akin to it; for both these words seem unto me to signify an ill-grounded separation in ecclesiastical communion made about things not necessary. But since use, which is the supreme law in matter of language, has determined that heresy relates to errors in faith, and schism to those in worship or discipline, we must consider them under that distinction.

Schism, then, for the same reasons that have already been alleged, is nothing else but a separation made in the communion of the Church upon account of something in divine worship or ecclesiastical discipline that is not any necessary part of it. Now, nothing in worship or discipline

can be necessary to Christian communion but what Christ our legislator, or the Apostles by inspiration of the Holy Spirit, have commanded in express words.

In a word, he that denies not anything that the Holy Scriptures teach in express words, nor makes a separation upon occasion of anything that is not manifestly contained in the sacred text- however he may be nicknamed by any sect of Christians and declared by some or all of them to be utterly void of true Christianity- yet in deed and in truth this man cannot be either a heretic or schismatic.

These things might have been explained more largely and more advantageously, but it is enough to have hinted at them thus briefly to a person of your parts.

BOOK III

THE SECOND PART

CHAPTER 1, SECTION. 1: What is meant by Idea's; That they truly Exist, and that they are necessary to perceive all material Objects.

I Think every one will confess, that we do not perceive External Objects by themselves. We see the Sun, the Stars, and many Objects without us; and it is not probable that the Soul should go out of the Body, and walk as it were, through the Heavens, to Contemplate all those Objects there. She does not then see them by themselves and as the immediate Object of Mind; when it sees the Sun, for instance, it is not the Sun, but something which is nearly united to our Soul; and it is that which I call Idea: So that here by this word *Idea*, I mean only what is the immediate Object, or the nearest the Mind when it perceives any thing.

It must be observed, that to make the Mind perceive any Object, it is absolutely necessary that the Idea of this Object should be actually present, of which we can have no doubt; but it is not requisite that there should be some external Object which resembles this Idea; for it often happens, that we perceive things which are not, and which never had a being. So that we often have in our Minds real Idea's of things which never were. For instance, when a Man imagines a Mountain of God, it is absolutely necessary that the Idea of this Mountain should be really present to his Mind: When a Mad Man, a Man in a high Fever, or a Man that is asleep, sees any terrible Animal before his Eyes, it is certain that the Idea of this animal truly Exists; and yet this Mountain of Gold, and this Animal, never were.

However, Men being Naturally inclined to believe that there is none but Corporeal Objects which Exist, they Judge of the Reality and Existence of things quite after another manner than they ought to do; for as soon as they are sensible of any Object, they will certainly have it that this Object

Exists, although it often happens, that there is nothing without: And further, they affirm, that this Object is exactly the same as they see it, which never happens. But in respect to the Idea which necessarily Exists, and which can be nothing else besides what it appears to be, they without any reflection, commonly Judge it to be nothing; as if Idea's had not a very great number of Properties: As if the Idea's of a Square, for instance, was not very different from that of some number, and did not represent things perfectly distinct; which could never happen to nothing, since nothing has no Propriety. It is therefore indisputable, that Idea's have a real Existence. But let us examine their Nature and Essence, and see what it can be in the Soul that is capable of representing all things.

Whatever things the Soul perceives, are either in, or out of its self, those which are in the Soul, are its own thoughts; that is, all its different Modifications; for by these words, *Thought, manner of Thinking, or modification of the Soul*, I understand in general all things, that can be in the Soul without her perceiving them, as her own Sensations, Imaginations, pure Intellections, or simple Conceptions, even her Passions, and Natural Inclinations. Now our Soul has no need of Idea's to perceive all these things, because they are within the Soul; or rather, the Soul it self, after such or such a manner: Even as the real roundness of some Body, and its Motion, are only this Body Figured, and moved after such or such a manner.

But as for things that are out of the Soul, we can perceive them only by the means of Idea's, supposing that these things cannot be intimately united to it. There are two sorts of them, Spiritual, and Material: As for the Spiritual, there is some probability that they may discover themselves to the Soul without Idea's, and by themselves. For although Experience teaches us, that we cannot immediately, and of our selves, declare our Thoughts to one another, but only by words, or some other sensible Sign, to which we have affixed our Idea's: We may say, that God has ordained it so only during this Life, to hinder those Disorders that would soon happen, if Men could make themselves be understood as they pleased. But when Justice and Order shall Reign, and we shall be delivered from the Captivity of our Bodies, we shall perhaps make our selves mutually understood by an intimate Union of our selves, as its probable the Angels do in Heaven; so that it does not seem absolutely necessary to admit Idea's to represent spiritual things to the Soul, because it may be, we may see them by themselves, although after a very imperfect manner.

I examine not here how two Spirits can be united one to the other, and if they can after this manner mutually discover one anothers Thoughts. I believe however, that there is no Substance purely intelligible, but that of God; nothing can be evidently known but in his Light; and that the Union of spirits cannot make them Visible: For although we are most strictly united to our selves, we are and shall be unintelligible to our selves, until we see our selves in God; and that he represents to us the perfect intelligible Idea that he hath of our being included in his. So that although I may seem here to grant, that Angels can manifest one to another what they are, and what they think; 'tis only because I will not dispute of it, provided I am granted what is not to be doubted, viz. That we cannot see material things by themselves, and without Idea's.

I shall explain in the Seventh Chapter, my Opinion how we know Spirits; and will shew, that at present we cannot absolutely know them by themselves, although it may be they are united to us. But I speak here chiefly of material things, which certainly cannot be united to the Soul, in such a manner as is necessary for us to perceive them: Because being extended, and the Soul not, there is no proportion between them. Besides, our Souls go not out of our Bodies to measure the greatness of the Heaven, and consequently, they cannot see External Bodies, but by the Idea's which represent them. This is what all the World ought to grant.

CHAPTER 1, SECTION. 2: A division of the several ways whereby External Objects may be seen.

We are assured the, that it's absolutely necessary, that the Idea's we have of Bodies, and of all other Objects which we perceive not by themselves, proceed from these Bodies, or these Objects; or else that our Soul has the power of producing these Idea's, or that God Created them with our Souls; or that he produces them every time that we think of any Object; or else that the Soul has all those perfections in it self that it sees in these Bodies: Or in fine, that it is united with a perfect Being, which in general includes all the Perfections of Created Beings.

We cannot see Objects but after one of these ways: Let us examine without prejudice, and without frighting our selves with the difficulty of the Question, which of them seems most probable: It may be, we may resolve it very clearly, although we do not pretend here to give such Demonstrations as will satisfie all sorts of persons; but only convincing Proofs to those at least, as will meditate with serious Attention upon them; for perhaps it would be thought too rash if we should pretend otherwise.

CHAPTER 2: That material Objects do not emit Species which resemble them.

The most common received Opinion is that of the Peripateticks, who think that External Objects emit Species which resemble them, and that those Species are carried by the External Senses to the Common Sense or Understanding. They call these Species *impressed*, because the Object imprints them on the External Senses. These *impressed* Species being Material and Sensible, are render'd intelligible, by means of the *active*, or *active intellect*; and are fit to be received in the *passive intellect*. These Species thus spiritualiz'd, are called *express'd* Species, because they are express'd by the impress'd ones; and 'tis by them that the Passive Intellect knows all material things.

We shall not stay to explain at large these fine things, and the divers manners in which different Philosophers conceive them; for although they do not agree as to the number of Faculties which they attribute to the Interior Sense, and the Understanding; and though there are not a few, who doubt whether they have need of any *active Intellect*, to know sensible Objects, yet however they generally agree, that External Objects emit the Species or Images which represent them. And 'tis only upon this Foundation that they multiply their Faculties, and defend their *active intellect*: So that this Foundation having no Solidity, as shall soon be shewn, it will be unnecessary to spend any time to overturn the Superstructure.

We are assur'd then, that it is improbable that Objects should emit their Images, or Species which represent them, for these reasons. I. From the impenetrability of Objects: All Objects, as the Sun, Stars, and all such as are near the Eyes; cannot emit Species which are different from their respective Natures: Wherefore Philosophers commonly say, that these Species are Gross and Material, in which they differ from *express'd* Species which are Spiritualised. These impress'd Species of Objects then are little Bodies, they cannot therefore be penetrated, nor all the Spaces which are betwixt the Earth and the Heaven, which must be full of them. Whence it's easie to conclude, they must be bruis'd and broken, in moving every way; and thus they cannot render Objects visible.

Moreover, one may see from the same place or point, a great number of Objects in the Heavens, and on the Earth; therefore the Species of these Objects can be reduc'd into a Point. But they are impenetrable since they are extended, Therefore, *etc.*

But one may not only see a multitude of very great and vast Objects: There is no Point in all the great Spaces of the World, from whence we cannot discover an almost infinite number of Objects, and even Objects as large as the Sun, Moon, and the Heavens, there is therefore no Point in all the

World where the Species of all these things ought not to meet; which is against all appearance of Truth.

The Second Reason is taken from the Change which happens in the Species; it's evident, that the nearer any Object is, the greater its Species ought to be, since we see the Object's greater. But what is yet more difficult to conceive, according to their Opinion, is, That if we look upon this Object with a Telescope, or a Microscope, the Species immediately becomes Six Hundred times as great as it was before; for 'tis yet more difficulty conceiv'd from what Parts it can grow so great in an instant.

The Third Reason is, when we look upon a perfect Cube, all the Species of its Sides are unequal; nevertheless, we see all the Sides equally Square. So when we consider Ellipses and Parallelograms in a Picture, which cannot but emit like Species, yet we see Circles and Squares: This manifestly shews, that it is not necessary that the Object beheld, should emit Species like it self, that it may be seen.

In fine, it cannot be conceiv'd how it can be, that a Body, which does not sensibly diminish, should always emit Species on every Side, which should continually fill all the great Spaces about it, and that with an inconceivable swiftness. For an Object that was hidden, in that Instant that it discovers it self may be seen many Millions of Leagues on all Sides; and what appears yet more strange is, that Bodies in great Motion, as Air, and some other, have not that power of pushing outwards these Images which resemble them; as the more gross and quiescent Bodies, such as the Earth, Stones, and generally all Hard Bodies have.

But I shall not stay any longer to enumerate all the contrary Reasons to their Opinion, there would be no end, a very ordinary Judgment would raise innumerable Objections. Those that we have brought are sufficient, though they were not so necessary after what has been said upon the Subject of the First Book, where the Errors of the Senses were explain'd. But there are so great a number of Philosophers wedded to this Opinion, that we believe it will be necessary to say something to incline them to reflect upon their own Thoughts.

CHAPTER 3: That the Soul has no power of producing Idea's. The Cause of Mens Error, in reference to this Subject.

The Second Opinion is that of those who believe our Souls have any power of producing the Idea's of such things as they will think upon, and they are excited to produce them by the Impressions which Objects make upon Bodies, although these Impressions are not Images like the Objects which cause them; they believe that 'tis in this, that Man is made after the Image of God, and participates of his Power. That even as God Created all things out of nothing, and can reduce them to nothing again, and then Create them anew; so Man can Create, and Annihilate the Idea's of all things as he pleases. But there is great Reasons to distrust all these Opinions which extol a Man, these are the Common Thoughts which arise from a vain and proud Original, and which the Father of Light hath not inspir'd.

This participation of the power of God which Men boast of having, to represent Objects, and of doing many other particular actions, is a participation which seems to relate to something of independence, as independence is commonly explain'd; it is also a Chimerical Participation, which Mens Ignorance and Vanity make them to imagine. They depend much more than they think, upon the Goodness and Mercy of God: But this is not a place to explain these things. It's enough if we endeavour to shew, that Men have not the Power of forming the Idea's of things which they perceive.

No one can doubt that Idea's are real Beings, since they have real Properties, since they differ from one another, and represent all different things; Nor can we reasonably doubt that they are spiritual, and very different from the Bodies which they represent. But it seems reasonable to doubt, whether Idea's, by whose means we see Bodies, are not more Noble than the Bodies themselves: for indeed the Intelligible World must be more perfect than the Material and Earthly, as we shall see hereafter. Thus when we affirm that we have the Power of Forming such Idea's as we please, we shall be in danger of perswading our selves, to make more Noble and Perfect Beings, than the World which God hath Created. However, some do not reflect upon it, because they imagine that an Idea is Nothing, since it is not to be felt; or else if they look upon it as a Being, 'tis a very mean, contemptible one, because they imagine it to be annihilated as soon as it is no longer present to the Mind.

But supposing it true, that Idea's were only little contemptible Beings, yet they are Beings, and Spiritual Ones; and Men not having the power of Believing, it follows that they cannot produce them; for the production of Idea's after the manner before explain'd, is a true Creation; and although Men endeavour to palliate and molline the hardness of this Opinion, by saying, that the production of Idea's presupposes something else, but Creation nothing; yet the difficulty is not solv'd by this Subterfuge.

For we ought to consider, that it is not more difficult to produce something out of nothing, than to produce one thing out of another: which cannot at all contribute to its Production. For example, it is not more difficult to Create an Angel, than to produce him from a Stone; because a Stone being of another sort of Being wholly different, it cannot in the least be useful to the Production of an Angel. But it may contribute to the Production of Bread, Gold, *etc.* for a Stone, Gold, and Bread, are but the same thing differently configur'd, and are all Material.

It is even more difficult to produce an Angel of a Stone, than to produce him out of nothing; because to make an Angel out of a Stone; (so far as it can be done) the Stone must be annihilated, and afterwards the Angel Created; But simply to Create an Angel, nothing is to be annihilated. If therefore the Mind produces its Idea's from the material Impressions which the Brain receives from Objects, it must always do the same thing, or a thing as difficult, or even more difficult than if it Created them; since Idea's being Spiritual, they cannot be produc'd of material Images, which have no proportion with them.

But if it be said, that an Idea is not a Substance, I consent to it, yet it is always something that is Spiritual; and as it is impossible to make a Square of a Spirit, although a Square be not a Substance from a Spiritual Idea, although an Idea was no Substance.

But although we should grant to the Mind of Man a Sovereign Power to Annihilate, and Create the Idea's of things, yet it would never make use of that Power to produce them; for even as a Painter, how skilful soever he be, could not represent an Animal which he had never seen, and of which he never had any Idea: So that the Picture which he should make, should be like to this unknown Animal. Thus a Man cannot form the Idea of an Object, if he knew it not before, that is, if he has not already had some Idea of it, which does not depend upon his Will; and if he already had an Idea of it, he certainly knows this Object, and it would be unnecessary for him to Form it anew. It is therefore in vain to attribute to the Mind of Man the Power of producing his Idea's. It might be said perhaps, that the Mind of Man hath general and confused Idea's which it does not produce; and that those which it produces are particular, more clear and distinct; but it is always the same thing. For even as a Painter cannot draw the Picture of a particular Person, so as to be sure that he

hath perfected it, if he had had no distinct Idea of him; and even if the Person had not been present: Thus the Mind, for example, which could only have the Idea of a Being, or an Animal in general, could not represent to its self a Horse, nor Form a distinct Idea of one, and be assured that it is perfectly like a Horse, if it had not already the first Idea with which it might compare this second: Now if it had a first, it is unuseful to Form a second; and the Question respects this first. Therefore, *etc.*

It's true, that when we conceive a Square by pure Intellection, we can also imagine it, that is, perceive it in our selves, by tracing an Image of it in the Brain; yet it must be first observ'd, that we are not the true nor principal Cause of this Image: But it will be too long to explain it here. Secondly, So far is the second Idea which accompanies this Image, from being more distinct and more exact than the other, that on the contrary, it is not so Exact, because it resembles the first, which was only a pattern for the second. For indeed we must not believe that the Imagination and Senses represent Objects more distinctly to us than the pure Understanding; but only that they apply them more to the Mind; for the Idea's of the Senses and Imagination are not distinct, but only so far as they are conformable to the pure Intellection: The Image of a Square for example, which the Imagination Traces in the Brain, is not exact and perfect, but only so far as it resembles the Idea of the Square, which we conceive by pure Intellection. It is this Idea which regulates this Image, 'tis the Mind which Conducts the Imagination; and which Obliges it, if we may so say, to behold from time to time, whether the Image it Paints, be a Figure of four right and equal Lines, whose Angles are alike. In a word, whether what it Imagines, is like to what it Conceives.

After what has been said, I do not believe it can be doubted, but those are deceived, who affirm, the Mind is able to Form the Idea's of Objects; since they attribute the Power of Creation to the Mind, and even of Creating with Wisdom and Order, although it has no knowledge of what it does; for that is not Conceivable: But the cause of their Error is, that Men always Judge that a thing is the Cause of some Effect, when both are joined together, supposing the true Cause of this Effect be unknown to them. That makes all the World conclude, that a Bowl put in Motion, and meeting another, is the true and principal Cause of the Motion that it communicates to it; as the Will of the Soul is the true and principal Cause of the Motion of the Arm, and other the like prejudices; because it always happens, that a Bowl is shaken when it is met by another that runs against it: As our Arms are moved almost always when we Will, and we do not see any other apparent Cause of this Motion.

But when an Effect does not so often follow something which is not the Cause of it, there is nevertheless a great many Men, who believe this thing is the Cause of the Effect which happens; yet every Body is not guilty of the same Error. For instance, if a Comet appears, and after this Comet a Prince Dies: Some Stones lie exposed to the Moon, and they are eaten with Worms: The Sun is joined with Mars at the Nativity of a Child, and something extraordinary happens to this Child: All this is enough to perswade a great many Men, that the Comet, the Moon, and the Conjunction of the Sun with Mars, are the Causes of these Effects, and others like them; and the reason why all the World does not believe it, is that they do not always see these Effects follow these Causes.

But all Men having commonly the Idea's of Objects present to their Minds as soon as they with it, and it happening many times in a day, almost all conclude that the Will which accompanies the production, or rather the presence of Idea's, is truly the Cause of them: Because they see nothing in the same time that they can attribute it to; and they imagine the Idea's no longer Exist, when the Mind sees them no longer; and that they revive again anew, when they are again represented to the

Mind.

'Tis for these Reasons some Judge, that External Objects emit Images which resemble them, as we have mention'd in the precedent Chapter: For it being impossible to see Objects by themselves, but only by their Idea's, they judge the Object produces the Idea; because as soon as it is present they see it; and as soon as absent they see it no longer; and because the presence of the Object almost always accompanies the Idea which represents it to us.

Yet if Men were not prejudiced in their Judgments from this, that the Idea's of things are present to their Mind as soon as they Will them, they should only conclude, that according to the Order of Nature, their Will is commonly necessary for them to have those Idea's. Not that the Will is the true and principal Cause which presents them to the Mind, and much less, that the Will produces them from nothing, or after the manner they explain it. Nor ought they to conclude, that Objects emit Species resembling them, because the Soul commonly perceives them only when they are present; but only that the Object is for the most part necessary, in order to the Idea's being present to the Mind. And lastly, that a Bowl put into Motion, is the principal and true Cause of the shaking of another Bowl that it meets in the way, since the first had not the power of Motion in its self. They can only determine, that the meeting of two Bowls is an occasion to the Author, of the Motion of Matter to execute the Decree of his Will, which is the Universal Cause of all things, in communicating to the other Bowl a part of the Motion of the first; that is, to speak more clearly, in willing that the last should acquire so much more Motion as the first lost; for the moving force of Bodies can proceed only from the Will of him who preserves them, as we shall shew elsewhere.

CHAPTER 4: That we do not see Objects by the Means of Idea's which were created with us. And that God does not produce them in us so often as we have occasion for them.

THE Third Opinion is, That of those who say all Idea's are created with us.

To discover the Improbability of this Opinion, it will be necessary to consider that there is many different things in the World of which we have Idea's. But to speak only of simple Figures, it is certain that the Number of them is Infinite: Nay, even if we consider but one only, as the Ellipsis, we cannot doubt but the Mind conceives an infinite Number of different Kinds of them, when it considers that one of the Diameters may be lengthened out to Infinity, and the other always continue the same.

So the height of a Triangle may be augmented or diminished infinitely, the base being always the same, we may conceive there is an infinite Number of different Kinds of them: And also, which I desire may be consider'd here, The Mind in some manner perceives this infinite Number, although we can imagine but very few of them; and that we can at the same time have particular and distinct Idea's of many Triangles of different Kinds. But what must chiefly be observed is, That this general Idea that the Mind has of this Number of Triangles of different Kinds is sufficient to prove, That if we do not conceive each of these different Triangles by particular Idea's: And in short, If we comprehend not their Infinity, 'tis not the Defect of the Idea's, or that Infinity is not represented to us, but only the Defect of the Capacity and Extension of the Mind. If a Man should apply himself to consider the Properties of all the diverse Kinds of Triangles, although he should eternally continue this sort of Study, he would never want new and particular Idea's, but his Mind would be unprofitably fatigued.

What I have said of Triangles, may be applied to five, six, a hundred, a thousand, or ten thousand sided Figures, and so on *ad infinitum*. Now if the sides of a Triangle, which have infinite relations one with the other, make Triangles of infinite Kinds, it is plain that four, five, or a thousand sided

Figures are capable of admitting much greater Differences, since they are capable of a greater Number of Relations and Combinations of their sides, than simple Triangles are.

The Mind then sees all these things; it hath Idea's of them; and these Idea's would never fail it, although it should employ infinite Ages in the Consideration of one Figure only: And if it perceived not these infinite Figures all of a sudden, or comprehended not their Intinity, 'tis only because its Extension is very much limited. It hath then an infinite Number of Idea's: Do I say an infinite Number? It hath as many infinite Numbers of Idea's, as there are different Figures to be consider'd: So that since there is an infinite Number of different Figures, it's necessary that to know the Figures, the Mind have an infinitely infinite Number of Idea's.

Now I ask, If it's probable that God should Create so many things with the Mind of Man? For my part it does not appear so to me; chiefly, since that might be made in a more simple and easie manner, as we shall soon see. For as God always acts by the most simple ways, it does not seem reasonable to explain how we know Objects, by admitting the Creation of an infinite Number of Beings, since we can resolve this Difficulty in a more Easie and Natural way.

But although the Mind should have a Magazine of all the Idea's, which are necessary for it to see things, it would be yet more difficult to explain how the Soul should make choice of them to represent them: For instance, how it can represent the Sun to it self, whilst it is present to the Eyes of its Body?

For whereas the Image which the Sun imprints in the Brain, resembles not the Idea we have thereof, as has been elsewhere proved, and since the Soul perceives not the Motion that the Sun produces in the bottom of the Eyes, and in the Brain, it's inconceivable how it should exactly guess, amongst these infinite Number of Idea's that it has, which it must represent to it self, to imagine or to see the Sun: We cannot therefore say, That the Idea's of things were created with us, it is sufficient that we see the Objects that are about us.

Nor can we say that God produces as many of them every Moment, as we perceive different things; this has been sufficiently resuted from what has been said in this Chapter. Besides it is necessary that at all times we actually have in our selves the Idea's of all things, since we are always able to think of all things; which we could not if we perceiv'd them already confusedly; that is, If an infinite Number of Idea's were not present to our Minds; for we cannot will to think of Objects, of which we have no Idea.

CHAPTER 5: That the Mind neither sees the Essence, nor Existence of Objects, in considering its own Perfections. That none but God sees them in that manner.

THE Fourth Opinion is, That the Mind stands in need of nothing besides it self, to perceive Objects; and that it can, in considering it self and its own Perfections, discover all things that are without it.

It is certain that the Soul sees within it self, and without Idea's, all the Sensations and Passions it is capable of, as Pleasure, Pain, Cold, Heat, Colours, Sounds, Odours, Sapors, its Love, its Hatred, Joy and Sadness, *etc.* because all the Sensations and Passions of the Soul represent nothing External which is like them; and because they are only Modifications, which nothing but the Mind is capable of. But the Difficulty is, to know whether the Idea's which represent something that is without the Soul, and which resembles them in some measure, as the Idea's of a Sun, a House, a Horse, a River, *etc*. are only Modifications of the Soul; insomuch that the Soul cannot stand in need of any thing besides it self, to represent to it self all External Things.

There are Persons who make no Scruple to affirm, That the Soul being made to think, it has in it self, I mean, in considering its own Perfections, whatever is necessary to perceive Objects; for indeed the Soul being nobler than all the things it conceives distinctly, it may be said, that it contains them in some measure *Eminently*, according to the Notions of the Schools; that is, after a Nobler and more Sublime Manner than they are in themselves. They pretend, that thus Superior things comprehend the Perfections of those that are Inferior. And thus being the Noblest of the Creatures they know; they fancy they have in themselves, after a Spiritual Manner, all that is in the visible World. In a word, They will have the Soul to be like an Intelligible World, which comprehends in it self, whatever the Material and Sensible World comprehends; nay, Infinitely more.

But in my Opinion it is a great Presumption to maintain that Thought: If I am not mistaken, it is Natural Vanity, the Love of Independence, and the Desire of resembling him who comprehends all Beings in himself, which Confounds the Mind, and inclines us to believe, we possess what we have not: *Do not say that you are a :ogjt tp upir se;f. saus St/ Aistom*; for there is none but God who is a Light to himself, and who can, in considering himself, see whatever he has produced, or can produce.

It is certain that there was none but God alone before the World was Created, and he could not produce it without Knowledge and without Idea's: Consequently those Idea's which God had of the World, are not different from himself; and thus all Creatures, even the most Material and most Terrestrial, are in God, though in a manner altogether Spiritual, which we cannot apprehend. God therefore sees all Beings in himself, in considering his own Perfections which represent them to him. He also knows their Existence perfectly, for since the Existence of all things depend on his Will, he cannot be Ignorant of his own Will; it follows then, that he cannot be Ignorant of their Existence. And thus God does not only see in himself the Essence of all things, but also their Existence.

But the case is different as to Created Spirits, they can neither see the Essence of things, nor their Existence within themselves: They cannot see their Essence within themselves, because being very much limited, they do not contain all Beings, like God whom we may call the Universal Being, or plainly *He that is*, as he calls himself. Since therefore the Humane Mind may know all Beings and Infinite Beings, and yet not contain them, it is a certain Proof, that it does not see their Essence in it self. For the Mind does not only see sometimes one thing, and sometimes another successively, it also actually perceives Infinity though it does not comprehend it. So that not being actually Infinite, nor capable of Infinite Modifications at the same time, it is absolutely Impossible that it should see within it self what is not there. Therefore it does not see the Essence of things in considering its own Perfections, or by modifying it self diversely.

Neither does it see their Existence within it self, because the Existence of Beings do not depend upon its Will; and because the Idea's of those Beings may be present to the Mind, though they do not Exist; for everybody may have the Idea of a Mountain of Gold, though there be no Mountain of Gold in Nature: And though we rely on the report of the Senses to judge of the Existence of Objects; nevertheless Reason does not assure us, that we should always believe our Senses, since we find clearly that they deceive us. When a Man's Blood, for instance, is very much inflam'd; or barely when he Sleeps, he sometimes beholds Fields, Combats, and the like, which nevertheless are not present, and which perhaps never were. Therefore it is certain that it is neither within it self, nor by it self, that the Mind sees the Existence of things, but that in this case it depends upon some other things.

CHAPTER 6: That we see all things in God.

WE have examin'd in the preceding Chapter four different Manners in which the Humane Mind may see External Objects, which do not appear probable to us: There only remains the Fifth, which alone appears consonant to Reason, and the most proper to shew the Dependence that Spirits have on God in all their Thoughts.

In order to apprehend it rightly, we must remember what has been said in the preceding Chapter, that it is absolutely necessary that God should have in himself the Idea's of all the Beings he has created, since otherwise he could not have produced them; and that thus he sees all those Beings, by considering the Perfections which he includes in himself, and to which all Beings are related. Moreover, it is necessary to know that God is very strictly united to our Souls by his Presence, so that we may say that he is the place of Spirits, as Space is the place of Bodies. These two things being supposed, it is certain that the Mind may see what there is in God, which represents Created Beings, since that is very Spiritual, very Intelligible, and most present to the Mind. Thus the Mind may see in God the Works of God, supposing God be willing to discover to it what there is in him which represents them. These are the Reasons which seem to prove, that he rather Wills than Creates an Infinite Number of Idea's in every Mind.

First, Although we do not absolutely deny, that God was able to produce an Infinitely infinite Number of Beings, which represent Objects with every Mind he Creates; yet we ought not to believe that he does so. For it is not only consonant to Reason, but it also appears by the Oeconomy of Nature, that God never does by very difficult means, what may be done by a plain easie way: God does nothing in vain and without Reason: That which shews his Wisdom and his Power, is not to do little things by difficult Means; for that is repugnant to Reason, and shews a limited Knowledge: But on the contrary, it is to do great things by plain easie Means. 'Tis thus that out of Extension only he produces whatever we see that is admirable in Nature, and even that which gives Life and Motion to Animals. For those who will needs have Substantial Forms, Faculties, and Souls in Animals, different from their Blood, and from the Organs of their Body, in order to perform their Functions, at the same time seem to argue that God wants Understanding, or that he cannot do those admirable things by Extension only. They measure the Power of God, and his Sovereign Wisdom, by the smallness of their own Capacity. Then since God may make Humane Minds see all things, by willing barely that they should see what is in themselves; that is, what is in him that has a relation to those things, and which represents them, there is no probability that he would do it otherwise; and that he should produce, in order thereunto, as many Infinities of Infinite Numbers of Idea's, as there are Created Spirits.

But we must observe, that we are not to conclude, that Spirits see the Essence of God, because they can see all things in God in that manner: Since what they see is very Imperfect; but that God is very Perfect: They see Matter Divisible and Figured, *etc.* and there is nothing in God that is Divisible or Figured; for God is all Beings, because he is Infinite and Comprehends all; but he is no Being in particular. Nevertheless that which we see is but one, or several Beings in particular, and we do not apprehend that perfect Simplicity of God which includes all Beings. Besides that it may be said, that we do not so much see the Idea's of things, as the things which those Idea's represent; for when we see a Square, for instance, we do not say that we see the Idea of that Square, which is united to the Mind, but only the Square which is without us.

The Second Reason which may induce us to believe, that we see all Beings, because God Wills, that that which is in him, which represents them, should be discover'd to us; and not because we have

as many Idea's created with us as we can see things; for this puts all created Spirits in an absolute dependence upon God, and the greatest that can be: For this being so, we cannot only see nothing, but what God is will we should see, but we can also see nothing, unless God himself shews it us. *Non sumus sufficientes cogitare aliquid a nobis, tanquam ex nobis, sed sufficientia nostra ex Deo est.* 'Tis God himself which instructs and enlightens Philosophers in that Knowledge which ungrateful Men call Natural, although it is an immediate gift from Heaven: *Deus enim illis manifestavit*. It is he that is properly the Light of the Mind, and the Father of Light or Knowledge. *Pater Luminum*. It is he that teaches Wisdom to Men: *Qui docet hominem scientiam*. In a word, He is the true Light, which enlightens all those that come into this World: *Lux vera que illuminat omnem hominem venientem in bunc Mundum.*

For in fine, It is pretty difficult distinctly to apprehend the Dependence which our Minds have on God in all their particular Actions, supposing they have all that which we distinctly know to be necessary for them in order to Act, or all the Idea's of things present to their Mind, and truly that general and confused word Concurrence, by which Men pretend to explain the Dependence that Creatures have on God, does not awaken any distinct Idea in an attentive Mind; and yet it is very necessary Men should know distinctly, that they can do nothing without God.

But the strongest of all Reasons, is the manner how the Mind perceives all things. It is certain, and every body knows by Experience, that when we have a mind to think on any thing in particular, we first cast our Eyes on all Beings; and in the next place we apply our selves to the Consideration of the Object we design to think on. Now it is most certain that we see it already, though confusedly and in general: So that as we may desire to see all the Beings, sometimes one and sometimes another, it is certain that all Beings are present to our Mind; and it appears that all Beings can only be present to our Mind, because God is present to it, that is, He who includes all things in the Simplicity of his Being.

It seems moreover, That the Mind would not be capable of representing to it self universal Idea's of Kinds and Species, *etc.* unless it saw all Beings included in one. For every Creature being a particular Being, we cannot say that we see any thing Created, when we see, for instance, a Triangle in general. In fine, I am of opinion, that it is impossible to give a good Reason of the Manner how the Mind comes to know several abstracted and general Truths, unless it be by the presence of him that can direct the Mind in a World of different Manners.

In fine, The Best, the most Sublime, the most Solid, and the chief Proof of the Existence of God, or that which supposes the fewest things, is the Idea we have of Infinity, though it does not comprehend it; and that it has a very distinct Idea of God, which it can only have by the Union it has with him; since it cannot be conceiv'd that the Idea of a Being infinitely perfect, as that we have of God, should be any thing that is Created.

But the Mind has not only the Idea of Infinity, it has it even before that of Finite. For we conceive the Infinite Being, from this alone that we conceive a Being, without considering whether it is Finite or Infinite. But in order to conceive a Finite Being, we must needs retrench something of that general Notion of a Being, which consequently must precede. Thus the Mind perceives nothing but in Infinity; and that Idea is so far from being form'd by the confused Mixture of all the Idea's of particular Beings, as Philosophers imagine; that on the contrary all those particular Idea's are only Participations of the general Idea of Infinity: As God does not derive his Being from the Creatures, but all Creatures only subsist by him.

The last Proof, which perhaps will be a Demonstration to those that are used to abstracted

Arguments, is this, It is impossible that God should have any other principal End of his Actions but himself: It is a Notion that is common to all Men that are capable of any Reflection; and Holy Writ does not allow us to doubt, but that God has made every thing for himself. Therefore it is necessary, that not only our Natural Love, I mean the Motion he produces in our Mind, should tend towards him: But moreover, That the Knowledge and the Light which he bestows upon it, should make us know any thing that is in him; for whatever comes from God can only be for God. Should God Create a Spirit, and give it for an Idea, or for the immediate Object of its knowledge the Sun: In my Opinion, God would Create that Spirit, and the Idea of that Spirit, for the Sun and not for him.

God cannot therefore Create a spirit to know his Works, unless that Spirit sees God in some measure, by beholding his Works. So that we may say, that unless we do see God in some measure, we should see nothing: In like manner, unless we do Love God, I mean, unless God did continually Imprint in us the Love of Good in general, we should Love nothing. For that Love being our Will, we can Love nothing, nor Will anything without him; since we cannot Love particular Goods, without determining towards those Goods, the motion of Love, which God gives us towards him. So that as we Love nothing but by the necessary Love we have for God, so we see nothing but by the Natural Knowledge we have of God: And all the particular Idea's we have of Creatures, are only Limitations of the Idea of the Creator, as all the Motions of the Will for the Creatures, are only determinations of the motion for the Creator.

I believe there are no Divines but what will grant, that the Impious Love God with that Natural Love I speak of: and St. *Austin* and some other Fathers affirm as an undeniable thing, That the Impious behold in God the Rule of Manners, and Eternal Truths. So that the Opinion I explain ought not to trouble any Body. Thus St. *Austin* speaks: *Ab ida incommutabili luce veritatis, etiam impius, dum ab ea avertitur, quedammodo tangitur. Hinc est quod etiam impii cogitant eternitatem, & multa recte riprehendunt recteque laudant in bominum moribus. Quibus ea tandem regulis judicant, nisi in quibus vident, quemadmodum quisque vivere debeat, etiam si nec ipsi eodem modo vivant? Ubi autem eas vident? Neque enim in sua natura. Nam cum precul dubio mente ista videantur, corumque mentes constet esse mutabiles, bas vero regulai immutabiles, videa: quisquis in eis & Loc videre potuerit—ubinam ergo sunt ishe regula Scripta, misi in libro lucis illiue, que veritas dicitur, unde lex omnis justa describitur—inquavidet quid operandum sit, etiam qui operatur injustitiam, & ipse est qui ab illa luce avertitur a qua tamen tangitur.*

There are many passages in St. *Austin* like unto this, by which he proves, that we see God even in this Life, by the knowledge we have of Eternal Truths. Truth is uncreated, Immutable, Immense, Eternal, above all things. It is true by it self. It derives its Perfection from nothing: It makes Creatures more perfect; and all Spirits naturally endeavour to know it. Nothing but God can have all those Perfections. Therefore Truth is God. We see some of those Immutable Eternal Truths. Therefore we see God. These are St. *Austin's* Reasons, ours differ a little from them; and we are unwilling to use the Authority of so great a Man unjustly, to second our Sentiment.

We believe that Truths, even those that are Eternal; as that twice two are four, are not so much as absolute Beings: So far are we from believing that they are in God. For it is visible, that that Truth only consists in a relation of Equality, which is between twice Two and Four. Therefore we do not say that we see God in seeing Truths, as St. *Austin* says, but in seeing the Idea's of those Truths: For Idea's are real, but the Equality between the Idea's, which is Truth, has no reality. When for example, Men say that the Cloth they measure contains Three Yards; the Cloth and the Yards are real: But the Equality between Three Yards and the Cloth is not a real Being; it is only a relation

that is between the Three Yards and the Cloth. When we say that twice Two are Four, the Idea's of the Numbers are real; but the Equality there is between them is only a Relation. Thus according to our Sentiment we see God, when we see Eternal Truths; not that those Eternal Truths are God, but because the Idea's on which those Truths depend are in God; perhaps St. *Austin* understood it so. We also believe, that we know in God Changeable and Corruptible things, although St. *Austin* only speaks of Immutable and Incorruptible things; because it is not necessary for that to place any Imperfection in God; since it suffices, as we have already said, that God should shew us what there is in him that has a Relation to these things.

But though I say, we see in God the things that are Material and Sensible, it must be observ'd, that I do not say we have a Sensation of them in God, but only that it is from God who Acts in us; for God Knows sensible things, but he does not Feel them. When we perceive any thing that is sensible, Sensation and pure Idea is in our Perception. Sensation is a Modification of our Soul, and it is God that Causes it in us: And he may Cause it, though he has it not, because he sees in the Idea he has of our Soul, that it is capable of it. As for the Idea which is joyn'd to Sensation, it is in God, we see it, because it is his pleasure to discover it to us: And God joins Sensation to the Idea, when Objects are present, to the end that we may believe them as they are: and that we may have such Sensations and Passions as we ought to have in relation the them.

Lastly, We believe that all Spirits see the Eternal Laws as well as other things in God, but with some difference: They know the Eternal Order and Eternal Truths, and even the Beings which God has made according to those Truths, or according to the Order by the Union which those Spirits have necessarily with the *Word*, or *Wisdom* of God which directs them, as we have shewn; But 'tis by the Impression they receive continually from the Will of God, which inclines them to him, and endeavours, as it were, to render their Will absolutely like unto his; that they know Order is a Law, I mean, that they know the Eternal Laws: How we must love Good, and shy from Evil: That we must love Justice more than all Riches: That it is better to Obey God than to Command Men, and many other Natural Laws. For the knowledge of all those Laws is not different from the knowledge of that Impression, which they always feel in themselves, though they do not always follow it by the free choice of their Will; which they know to be Common to all Spirits, though it is not equally strong in all.

It is by that Dependance, Relation, and Union of our Mind to the *Word* of God, and of our Will to his Love, that we are made after the Image and Likeness of God: And although this may be very much defac'd by Sin, yet it is necessary that it should subsist as long as we do. But if we bear the Image of the *Word* humbled upon earth; and if we follow the Motions of the Holy Ghost, that Primitive Image of our first Creation, that Union of our Mind with the *Word* of the Father, and to the Love of the Father and of the Son, will be re-established, and render'd indelible. We shall be like God, if we are like the *Man God*. In fine, God will be all in us, and we all in God, in a far more perfect manner than that by which it is necessary for us to subsist, that we should be in him, and he in us.

Here are some reasons which may perswade us, that Spirits perceive all things by the immediate Presence of him who Comprehends all in the Simplicity of his Being. Every one will Judge of it according to the Internal Conviction he shall receive of it, after having seriously consider'd it. But 'tis thought that there will be no probability in all the other ways of explaining these things; and that this last will appear more than probable. Thus our Souls depend on God in all respects. For as it is he who makes them feel Grief, Pleasure, and all other Sensations, by the Natural Union he has Establish'd between them and our Body which is no other than his Decree and general Will. Thus

it is he, who by the Natural Union which he has made between the Sill of Man, and the Representation of the Idea's which the Immensity of the Divine Being includes, that makes them know whatever they do know; and that Natural Union is also nothing else but his general Will. So that none but he can direct us, by representing all things to us; as none but he can make us Happy, by making us taste all manner of Pleasures.

Let us therefore keep to this Opinion, That God is the Intelligible World, or the place of Spirits, as the material World is the place of Bodies. That they receive all their Modifications from his Power: That they find all their Idea's in his wisdom: And that it is by his Love that they are acted in all their regular Motions; and since his Power and Love are nothing but himself, let us believe with St. *Paul*, that he is not far from every one of us; and that it is in him we have Life, Motion, and a Being. *Non longe est ab unequoque nostrum, in ipso cnim vivimus, movemur, & sumius.*

BOOK 6

THE SECOND PART

CHAP. III: *Of the most dangerous Error in Philosophy. Of the Ancients.*

Philosophers have not only spoke what they did not conceive, when they explained the Effects of Nature, by certain Beings which they have no particular Idea of, but even establish a Principle from whence may directly be drawn most false and dangerous Consequences.

For if, according to their Opinion, we suppose, that in Bodies there are some Beings distinct from Matter; and not having any distinct Idea of these Entities, we might easily imagine, that they are the true, or principal Causes of the Effects which we see produced. Tis even the common Sentiment of most Philosophers: For 'tis chiefly to explain these Effects, that they make use of Substantial Forms, Real Qualities, and other the like Entities. But when we come to consider attentively, the Idea we have of *Cause* or *Power* of acting, we cannot doubt but that it represents something Divine: For the Idea of a Sovereign Power, is the Idea of Sovereign Divinity; and the Idea of a Subordinate Power, is the Idea of an inferiour; but a true Divinity at least, according to the Opinion of the Heathens, if it be the Idea of a Power or true Cause. We admit therefore something Divine in all Bodies which encompass us, when we admit Forms, Faculties, Qualities, Vertues, and real Beings, capable of producing certain Effects, by the Power of their own Nature: And thus, they insensibly enter into the Opinions of the Heathens, by the Respect they have for their Philosophy. Faith indeed works it, but it may perhaps be said, that if we are Christians in our Hearts, we are Heathens in our Minds.

Moreover, it is difficult to perswade our selves, that we ought neither to love or fear, true Powers and Beings, who can act upon us, punish us with Pain, or recompense us with Pleasure. And as Love and Fear are a true Adoration, 'tis also difficult to perswade our selves that we ought not to adore them. For whatever can act upon us, as a real and true Cause, is necessarily above us, according to *St. Austin* and right Reason: The same Father, and the same Reason tells us, 'tis an immutable Law that Inferiour things should submit to superiour. And from hence, this great Father concludes, that the Body cannot act upon the Soul, and that nothing can be above the Soul but God.

In the Holy Scriptures, when God proves to the *Israelites*, that they ought to adore him, that is, that they ought to fear and love him, the chief Reasons he brings, are taken from his Power, to recompence and punish them. He represents to them the Benefits they have received from him, the

Evils wherewith he hath chastised them, and that he has still the same Power. He forbids them to adore the Gods of the Heathens, because they have no Power over them, and can do them neither Good nor Hurt. He requires them to honour him only, because he only is the true Cause of Good and Evil, and that there happens none in their City, according to the Prophet, which he has not done; for Natural Causes are not the true Causes of the Evil that appears to be done to us. 'Tis God alone that acts in them, and 'tis he only that we must fear and love: *Soli Deo Honor & Gloria.*

In short, this Opinion, that we ought to fear and love, whatsoever is the true Cause of Good and Evil, appears so natural and just, that it is impossible to destroy it; so that if we suppose this false Opinion of the Philosophers (which we endeavour here to confuse) that Bodies which encompass us are the true Causes of the Pleasures and Evils which we feel: Reason seems to juitine a Religion like to that of the Heathens, and approves of the universal Irregularity of Manners.

It is true, that Reason does not tell us that we must adore Onyons and Leeks, as the Sovereign Divinity; because they cannot make us entirely happy when we have of them, or entirely unhappy when we want them. Nor have the Heathens ever done to them so much Honour as to the great *Jupiter*, upon whom all their Divinities depend, or as to the Sun, which our Senses represent to us, as the universal Cause, which gives Life and Motion to all things, and, which we cannot hinder our selves from regarding as a Sovereign Divinity; if with the Heathen Philosophers, we suppose it includes in its being the true Causes of whatever it seems to produce, not only in our Bodies and Minds, but likewise in all Beings which encompass us.

But if we must not pay a Sovereign Honour to Leeks and Onyons, yet we may always render them some particular adoration: I mean, we may think of and love them in some manner; if it is true, that in some sort they can make us happy, we must honour them in Proportion to the Good they can do us. And certainly, Men who give Ear to the Reports of their Senses, think that Pulse is capable of doing them good; for else the *Israelites*, for instance, would not have regretted their Absence in the Defect, nor considered it as a Misfortune to be deprived of them, if they did not, in some manner, look upon themselves happy in the Enjoyment of them. These are the Irregularities which our Reason engages us in, when it is joyned to the Principles of the Heathen Philosophy, and follows the Impressions of the Senses.

That we may longer doubt of the Falseness of this Miserable Philosophy, and the Certainty of our Principles, and Clearness of the Idea's we make use of: It is necessary, clearly to establish those Truths which are opposite to the Errors of the ancient Philosophy, and to prove, in short, that there is only one true Cause, because there is only one true God: That Nature, or the Power of every thing, proceeds only from the Will of God: That all Natural things are not true Causes, but only occasional ones; and some other Truths which will be the Consequences of these.

It is evident that all Bodies, both great and small, have no power of removing themselves: A Mountain, an House, a Stone, a grain of Sand; and in short, the least or biggest Bodies we can conceive, have no power of removing themselves. We have only two sorts of Idea's, that of Bodies, and that of Spirits; whereas we ought to speak only of those things which we conceive we should reason according to these two Idea's. Since therefore the Idea we have of all Bodies, shows us that they cannot move themselves, it must be concluded that they are moved by Spirits only. But when we examine the Idea we have of all finite Minds, we do not see the necessary Connexion between their Wills and the Motion of any Body whatsoever it be: On the contrary, we see that there is none, nor can be any; whence we ought to conclude, if we will argue according to our Knowledge, that as no body can be able to move it self, so there is no created Spirit can be the true or principal

cause of the Motion of any body whatever.

But when we think of the Idea of God, of a Being infinitely Perfect, and consequently Almighty, we know that there is such a Connexion between his Will, and the Motion of all Bodies, that 'tis impossible to conceive he should Will the Motion of a Body, that should not be moved: We must then say, that his Will only can move Bodies, if we will speak things as we conceive them, and not as we feel them. The moving force of Bodies therefore, is not in the Bodies which move, since this power of Motion is nothing else but the Will of God. Thus Bodies have no Action, and when a Bowl which is moved, by meeting it moves another, yet it communicates nothing of its own; for in itself it hath not the Impression that it communicates to the other: Yet a Bowl is the Natural Cause of the motion which it communicates. A Natural Cause then is not a real and true Cause, but only an occasional one, and which determined the Author o Nature to act after such and such a manner, in such and such an Occurrence.

It is certain, that 'tis by the motion of visible or invisible Bodies that all things are produced: For Experience teaches us, that Bodies, whose parts are in greatest Motion, always act more than others, and produce the greatest Change in the World. All the Powers of Nature then proceed from the Will of God: He has created the World because he willed it: *Dixit & facta funt*: He moves all things, and so produces all the Effects that we see happen; because he has also willed certain Laws, according to which Bodies communicate their Motions in their Rencounter; and because these Laws are Efficacious they act, and Bodies cannot act. There is therefore no Force, Power, or true Cause, in the Material and Sensible World, nor must we admit of Forms, Faculties, and real Qualities, to produce Effects that Bodies cannot; and to divide, with God, the Force and Power which is Essential to him. Not only Bodies cannot be the true Causes of any thing, the most noble Spirits also are under a like Impotence. They can know nothing if God does not enlighten them; nor can they have any Sensation if he does not modifie them. They are capable of willing nothing if God moves them not towards him. I confess they can determine the Impression that God gives them towards him, to other Objects; but I know not whether that can be called a Power. If the Capability of Sinning is a Power, it would be a Power which the Almighty has not. St. *Austin says* in some of his Works, If Men had in themselves the Power of loving Good, we might say they had some Power: But can only Love, because God Wills they should Love, and because his Will is Efficacious. They Love only, because God continually inclines them to Good in General; that is, towards himself: For God has created them only for himself, he never preserves them without turning them towards and inclining them to himself. They have no Motion towards Good in general, 'tis God who moves them; they only follow by an entire free Choice, this Impression according to the Law of God, or determine it towards a false Good after the Law of the Flesh: They can only be determined by a Prospect of Good: For being able to do only what God makes them, they can love nothing but Good.

But if we should suppose what is true in one Sense, that Spirits have in themselves the Power of knowing Truth and loving Good, if their Thoughts and Wills produced nothing External, we might always say they were able to do nothing. Now it appears most certain to me, that the Will of Spirits is not capable of moving the least Body in the World: For 'tis evident there is no necessary Connexion between the Will we have of moving our Arms, and the Motion of them. It is true, they are moved when we please, and by that means we are the Natural Cause of their Motion: But Natural Causes are not true Causes, they are only Occasional ones, which act merely through the Power and Efficacy of God, as I have already explained.

For how can we move our Arms? To move them we must have Animal Spirits, and convey them by

certain Nerves, into such and such Muscles to swell and contract them. For by this means the Arms move; or according to the Opinion of some, we know not yet how 'tis performed: And we see, that Men who do not so much as know they have Spirits, Nerves, and Muscles to move their Arms, yet move them with as much Art and Facility, as those that understand Anatomy best. 'Tis then granted, that Men Will the Motion of their Arms, but 'tis only God that can and knows how to remove them. If a Man cannot throw down a Tower, at least he knows well what must be done in order to it: But there is no Man that knows so much, as what he must do to move one of his Fingers by the help of his Animal Spirits. How then can Men move their Arms? These things appear evident to me, and to all those that will think of them, though perhaps they may be incomprehensible to such as will not consider them.

But Men only are not the True Causes of the Motions produced in their Bodies, it seems even a Contradiction that they should be so. A True Cause is such an one as the Mind perceives a necessary Connexion between it and its Effect; 'tis that I mean. Now there is only the Infinitely Perfect Being, whose Mind can perceive a necessary Connexion between his Will and the Effects of it. 'Tis only God then, who is the True Cause, and who has really the Power of moving Bodies. I say moreover, 'tis not probable that God should communicate, either to Men or Angels, this Power he has of moving Bodies; and those who pretend the Power we have of moving our Arms is a true Power, must confess that God can also give to Spirits the Power of creating, annihilating, and performing all possible things: In a word, That he can make them Almighty, as I shall further shew.

God has no need of any Instrument to act, it is sufficient if he Wills a thing for it to be, because it is a Contradiction to suppose he Wills it, and that it should not be. His Power then is his Will, and the communicating of his Power is a Communication of his Will. But to communicate his Will to a Man or an Angel, can signifie nothing else but Willing; some body, for instance, should be effectively moved when 'tis Will'd by a Man or an Angel. Now in this case I see two Wills which concur when an Angel would move a Body, that of God, and that of the Angel; and to know which of the two will be the true Cause of the Motion of this Body, we must know which it is that is Efficacious. There is a necessary Connexion between the Will of God, and what he Wills. God Wills in this case, that a Body should move when it is willed by an Angel: There is a necessary Connexion therefore, between the Will of God and the Motion of this Body; and consequently 'tis God who is the true cause of the Motion of the Body, and the Will of the Angel only an occasional one.

But to shew it yet more clearly, let us suppose that God Wills it should happen quite contrary to what some Spirits desire; as we may think of Devils, or some other Spirits, who merit this Punishment; we cannot say in this case, that God communicates his Power to them, since they can do nothing that they would do. Yet the Wills of these spirits would be the Natural Causes of whatever Effects should be produced; as such Bodies should be moved to the Right Hand, because these Spirits would have them moved to the Left; and the desire of these Spirits would determine the Will of God to act, as our Wills to move the parts of our Bodies, determine the first Cause to move them: So that the Wills of Spirits are only occasional Causes.

Yet if after all these Reasons, we will still maintain, that the Will of an angel, which moves any body, should be a true Cause, and not an occasional one; it is plain that this same Angel might be the true Cause of the Creation and Annihilation of all things: For God could as well communicate to him his Power of Creating and Destroying Bodies, as that of moving them, if he will'd that things should be created and annihilated: In a word, If he will'd that all things should happen as the Angel wishes them, even as he Wills Bodies should move, as the Angel pleases. If it be said, that

an Angel or a Man would be the true movers, because God moves Bodies when they with it; it may also be said, that a Man and an Angel may be true Creators, since God can create Beings when they will it: Nay, perhaps it might be said, that the most Vile Animals, or Matter of it self, should be the effective Cause of the Creation of any Substance; if we supposed as the Philosophers do, that God produces substantial Forms whenever the Disposition of Matter requires it. In fine, Because God has resolved from all Eternity in certain times to create such or such things, we might also say, that these times should be the Causes of the Creation of these Beings, as reasonably as to pretend, that a Bowl which meets another, is the true cause of the motion it communicates to it: Because God has determined by his general Will, which constituted the Order of Nature, that when two Bodies should meet there should be such and such a Communication of Motion.

There is then but one only true God, and he the one only true Cause: And we must not imagine, that which precedes and Effect, to be the true Cause of it. God cannot even communicate his Power to the Creatures, if we follow the Light of Reason; he cannot make them true Causes, because he cannot make them Gods. Bodies, Spirits, pure Intelligences, can all do nothing. 'Tis he who hath made these Spirits that illuminates and acts them. 'Tis he who has created the Heavens and the Earth, which regulates the Motions thereof. In short, 'tis the Author of our Being that executes our Wills, *femel jussis, sewsper pares.* He even moves our Arms when we make use of them against his Orders, for he complains by his Prophets, that we make him serve our unjust and criminal Desires.

All these little Heathen Divinities, and all these particular Causes of the Philosophers, are only Chymera's that the wicked Spirit endeavours to establish to ruin the Worship of the true God. It is not the Philosophy they have received from Adam, which teaches these things; 'tis that they have received from the Serpent; for since the Fall, the Mind of Man is perfectly Heathenish. 'Tis this Philosophy which joyned to the Errors of the Senses, has made them adore the Sun, and which is still at this Day, the universal Cause of the Irregularity of the Mind, and Corruption of the Heart of Man. By their Actions, and sometimes by their Words; why say they, should we not love the Body, since the Body is capable of affording us all Pleasures? And why do we laugh at the *Israelites*, which regretted the Loss of the Garlick and Onyons of *Egypt*; since, in Effect, they were unhappy, by being deprived of what, in some Measure, could make them happy? But the new Philosophy, which they represent as a dismal thing, to affrighten weak Minds, that is despised and condemned without being understood. The new Philosophy, I say, since they are pleased to call it so, destroys all the Arguments of the Libertines, by the Establishment of the chiefest of its Principles, which perfectly agrees with the first Principle of the Christian Religion, that we must love and fear but one God, since there is only one God who can make us happy.

For if Religion teaches us, that there is but one true God, this Philosophy shews us there is but one true Cause. If Religion informs us, that all the Divinities of the Heathens are only Stones and Metals without Life and Motion: This Philosophy discovers to us also, that all second Causes, or all the Divinities of their Philosophy, are only Matter and inefficacious Wills. In short, if Religion teaches us, that we must not bow our Knees to false Gods. This Philosophy also tells us, that our Imaginations and Minds ought not to be prostituted to the Imaginary Greatness and Power of Causes, which are not true Causes: That we must neither love nor fear them, nor busie our selves about them; but think upon God only, see him, adore him, fear and love him in all things.

But this agrees not with the Inclination of some Philosophers: They will neither see nor think upon God: For since the Fall, there is a secret Opposition between God and Man: Men take Pleasure in erecting Gods after their own Fancy, they voluntarily love and fear the Fictions of their own Imagination, as they Heathens did the Works of their own Hands. They are like Children who

tremble at their Companions, after they have daubed their Faces: Or if they will have a more Noble Comparison, although perhaps it be not so just, they resemble those famous *Romans*, who had some Fear and Respect for the Fictions of their own Minds, and foolishly adored their Emperors after they had let loose the Eagle when they deified them.

The Search After Truth (1674)

Bk. 3, Pt. 2, Ch. 1-6
Bk. 6, Pt. 2, Ch. 3

Nicholas Malebranche

 This e-text is based on the anonymous translation Malebranche's Search After Truth (London: J. Dunton and S. Manship, Vol. 1, 1694; Vol. 2 1695).

BOOK III
THE SECOND PART

CHAPTER 1, SECTION. 1: What is meant by Idea's; That they truly Exist, and that they are necessary to perceive all material Objects.

I Think every one will confess, that we do not perceive External Objects by themselves. We see the Sun, the Stars, and many Objects without us; and it is not probable that the Soul should go out of the Body, and walk as it were, through the Heavens, to Contemplate all those Objects there. She does not then see them by themselves and as the immediate Object of Mind; when it sees the Sun, for instance, it is not the Sun, but something which is nearly united to our Soul; and it is that which I call Idea: So that here by this word Idea, I mean only what is the immediate Object, or the nearest the Mind when it perceives any thing.

It must be observed, that to make the Mind perceive any Object, it is absolutely necessary that the Idea of this Object should be actually present, of which we can have no doubt; but it is not requisite that there should be some external Object which resembles this Idea; for it often happens, that we perceive things which are not, and which never had a being. So that we often have in our Minds real Idea's of things which never were. For instance, when a Man imagines a Mountain of God, it is absolutely necessary that the Idea of this Mountain should be really present to his Mind: When a Mad Man, a Man in a high Fever, or a Man that is asleep, sees any terrible Animal before his Eyes, it is certain that the Idea of this animal truly Exists; and yet this Mountain of Gold, and this Animal, never were.

However, Men being Naturally inclined to believe that there is none but Corporeal Objects which Exist, they Judge of the Reality and Existence of things quite after another manner than they ought to do; for as soon as they are sensible of any Object, they will certainly have it that this Object Exists, although it often happens, that there is nothing without: And further, they affirm, that this Object is exactly the same as they see it, which never happens. But in respect to the Idea which necessarily Exists, and which can be nothing else besides what it appears to be, they without any reflection, commonly Judge it to be nothing; as if Idea's had not a very great number of Properties: As if the Idea's of a Square, for instance, was not very different from that of some number, and did not represent things perfectly distinct; which could never happen to nothing, since nothing has no Propriety. It is therefore indisputable, that Idea's have a real Existence. But let us examine their Nature and Essence, and see what it can be in the Soul that is capable of representing

all things.

Whatever things the Soul perceives, are either in, or out of its self, those which are in the Soul, are its own thoughts; that is, all its different Modifications; for by these words, Thought, manner of Thinking, or modification of the Soul, I understand in general all things, that can be in the Soul without her perceiving them, as her own Sensations, Imaginations, pure Intellections, or simple Conceptions, even her Passions, and Natural Inclinations. Now our Soul has no need of Idea's to perceive all these things, because they are within the Soul; or rather, the Soul it self, after such or such a manner: Even as the real roundness of some Body, and its Motion, are only this Body Figured, and moved after such or such a manner.

But as for things that are out of the Soul, we can perceive them only by the means of Idea's, supposing that these things cannot be intimately united to it. There are two sorts of them, Spiritual, and Material: As for the Spiritual, there is some probability that they may discover themselves to the Soul without Idea's, and by themselves. For although Experience teaches us, that we cannot immediately, and of our selves, declare our Thoughts to one another, but only by words, or some other sensible Sign, to which we have affixed our Idea's: We may say, that God has ordained it so only during this Life, to hinder those Disorders that would soon happen, if Men could make themselves be understood as they pleased. But when Justice and Order shall Reign, and we shall be delivered from the Captivity of our Bodies, we shall perhaps make our selves mutually understood by an intimate Union of our selves, as its probable the Angels do in Heaven; so that it does not seem absolutely necessary to admit Idea's to represent spiritual things to the Soul, because it may be, we may see them by themselves, although after a very imperfect manner.

I examine not here how two Spirits can be united one to the other, and if they can after this manner mutually discover one anothers Thoughts. I believe however, that there is no Substance purely intelligible, but that of God; nothing can be evidently known but in his Light; and that the Union of spirits cannot make them Visible: For although we are most strictly united to our selves, we are and shall be unintelligible to our selves, until we see our selves in God; and that he represents to us the perfect intelligible Idea that he hath of our being included in his. So that although I may seem here to grant, that Angels can manifest one to another what they are, and what they think; 'tis only because I will not dispute of it, provided I am granted what is not to be doubted, viz. That we cannot see material things by themselves, and without Idea's.

I shall explain in the Seventh Chapter, my Opinion how we know Spirits; and will shew, that at present we cannot absolutely know them by themselves, although it may be they are united to us. But I speak here chiefly of material things, which certainly cannot be united to the Soul, in such a manner as is necessary for us to perceive them: Because being extended, and the Soul not, there is no proportion between them. Besides, our Souls go not out of our Bodies to measure the greatness of the Heaven, and consequently, they cannot see External Bodies, but by the Idea's which represent them. This is what all the World ought to grant.

CHAPTER 1, SECTION. 2: A division of the several ways whereby External Objects may be seen.

We are assured the, that it's absolutely necessary, that the Idea's we have of Bodies, and of all other Objects which we

perceive not by themselves, proceed from these Bodies, or these Objects; or else that our Soul has the power of producing these Idea's, or that God Created them with our Souls; or that he produces them every time that we think of any Object; or else that the Soul has all those perfections in it self that it sees in these Bodies: Or in fine, that it is united with a perfect Being, which in general includes all the Perfections of Created Beings.

We cannot see Objects but after one of these ways: Let us examine without prejudice, and without frighting our selves with the difficulty of the Question, which of them seems most probable: It may be, we may resolve it very clearly, although we do not pretend here to give such Demonstrations as will satisfie all sorts of persons; but only convincing Proofs to those at least, as will meditate with serious Attention upon them; for perhaps it would be thought too rash if we should pretend otherwise.

CHAPTER 2: That material Objects do not emit Species which resemble them.

The most common received Opinion is that of the Peripateticks, who think that External Objects emit Species which resemble them, and that those Species are carried by the External Senses to the Common Sense or Understanding. They call these Species impressed, because the Object imprints them on the External Senses. These impressed Species being Material and Sensible, are render'd intelligible, by means of the active, or active intellect; and are fit to be received in the passive intellect. These Species thus spiritualiz'd, are called express'd Species, because they are express'd by the impress'd ones; and 'tis by them that the Passive Intellect knows all material things.

We shall not stay to explain at large these fine things, and the divers manners in which different Philosophers conceive them; for although they do not agree as to the number of Faculties which they attribute to the Interior Sense, and the Understanding; and though there are not a few, who doubt whether they have need of any active Intellect, to know sensible Objects, yet however they generally agree, that External Objects emit the Species or Images which represent them. And 'tis only upon this Foundation that they multiply their Faculties, and defend their active intellect: So that this Foundation having no Solidity, as shall soon be shewn, it will be unnecessary to spend any time to overturn the Superstructure.

We are assur'd then, that it is improbable that Objects should emit their Images, or Species which represent them, for these reasons. I. From the impenetrability of Objects: All Objects, as the Sun, Stars, and all such as are near the Eyes; cannot emit Species which are different from their respective Natures: Wherefore Philosophers commonly say, that these Species are Gross and Material, in which they differ from express'd Species which are Spiritualised. These impress'd Species of Objects then are little Bodies, they cannot therefore be penetrated, nor all the Spaces which are betwixt the Earth and the Heaven, which must be full of them. Whence it's easie to conclude, they must be bruis'd and broken, in moving every way; and thus they cannot render Objects visible.

Moreover, one may see from the same place or point, a great number of Objects in the Heavens, and on the Earth; therefore the Species of these Objects can be reduc'd into a Point. But they

are impenetrable since they are extended, Therefore, etc.

But one may not only see a multitude of very great and vast Objects: There is no Point in all the great Spaces of the World, from whence we cannot discover an almost infinite number of Objects, and even Objects as large as the Sun, Moon, and the Heavens, there is therefore no Point in all the World where the Species of all these things ought not to meet; which is against all appearance of Truth.

The Second Reason is taken from the Change which happens in the Species; it's evident, that the nearer any Object is, the greater its Species ought to be, since we see the Object's greater. But what is yet more difficult to conceive, according to their Opinion, is, That if we look upon this Object with a Telescope, or a Microscope, the Species immediately becomes Six Hundred times as great as it was before; for 'tis yet more difficulty conceiv'd from what Parts it can grow so great in an instant.

The Third Reason is, when we look upon a perfect Cube, all the Species of its Sides are unequal; nevertheless, we see all the Sides equally Square. So when we consider Ellipses and Parallelograms in a Picture, which cannot but emit like Species, yet we see Circles and Squares: This manifestly shews, that it is not necessary that the Object beheld, should emit Species like it self, that it may be seen.

In fine, it cannot be conceiv'd how it can be, that a Body, which does not sensibly diminish, should always emit Species on every Side, which should continually fill all the great Spaces about it, and that with an inconceivable swiftness. For an Object that was hidden, in that Instant that it discovers it self may be seen many Millions of Leagues on all Sides; and what appears yet more strange is, that Bodies in great Motion, as Air, and some other, have not that power of pushing outwards these Images which resemble them; as the more gross and quiescent Bodies, such as the Earth, Stones, and generally all Hard Bodies have.

But I shall not stay any longer to enumerate all the contrary Reasons to their Opinion, there would be no end, a very ordinary Judgment would raise innumerable Objections. Those that we have brought are sufficient, though they were not so necessary after what has been said upon the Subject of the First Book, where the Errors of the Senses were explain'd. But there are so great a number of Philosophers wedded to this Opinion, that we believe it will be necessary to say something to incline them to reflect upon their own Thoughts.

CHAPTER 3: That the Soul has no power of producing Idea's. The Cause of Mens Error, in reference to this Subject.

The Second Opinion is that of those who believe our Souls have any power of producing the Idea's of such things as they will think upon, and they are excited to produce them by the Impressions which Objects make upon Bodies, although these Impressions are not Images like the Objects which cause them; they believe that 'tis in this, that Man is made after the Image of God, and participates of his Power. That even as God Created all things out of nothing, and can reduce them to nothing again, and then Create them anew; so Man can Create, and Annihilate the Idea's of all things as he pleases. But there is great Reasons to distrust all these Opinions which extol a Man, these are the Common Thoughts which arise from a vain and proud Original, and which the Father of Light hath not inspir'd.

This participation of the power of God which Men boast of

having, to represent Objects, and of doing many other particular actions, is a participation which seems to relate to something of independence, as independence is commonly explain'd; it is also a Chimerical Participation, which Mens Ignorance and Vanity make them to imagine. They depend much more than they think, upon the Goodness and Mercy of God: But this is not a place to explain these things. It's enough if we endeavour to shew, that Men have not the Power of forming the Idea's of things which they perceive.

No one can doubt that Idea's are real Beings, since they have real Properties, since they differ from one another, and represent all different things; Nor can we reasonably doubt that they are spiritual, and very different from the Bodies which they represent. But it seems reasonable to doubt, whether Idea's, by whose means we see Bodies, are not more Noble than the Bodies themselves: for indeed the Intelligible World must be more perfect than the Material and Earthly, as we shall see hereafter. Thus when we affirm that we have the Power of Forming such Idea's as we please, we shall be in danger of perswading our selves, to make more Noble and Perfect Beings, than the World which God hath Created. However, some do not reflect upon it, because they imagine that an Idea is Nothing, since it is not to be felt; or else if they look upon it as a Being, 'tis a very mean, contemptible one, because they imagine it to be annihilated as soon as it is no longer present to the Mind.

But supposing it true, that Idea's were only little contemptible Beings, yet they are Beings, and Spiritual Ones; and Men not having the power of Believing, it follows that they cannot produce them; for the production of Idea's after the manner before explain'd, is a true Creation; and although Men endeavour to palliate and molline the hardness of this Opinion, by saying, that the production of Idea's presupposes something else, but Creation nothing; yet the difficulty is not solv'd by this Subterfuge.

For we ought to consider, that it is not more difficult to produce something out of nothing, than to produce one thing out of another: which cannot at all contribute to its Production. For example, it is not more difficult to Create an Angel, than to produce him from a Stone; because a Stone being of another sort of Being wholly different, it cannot in the least be useful to the Production of an Angel. But it may contribute to the Production of Bread, Gold, etc. for a Stone, Gold, and Bread, are but the same thing differently configur'd, and are all Material.

It is even more difficult to produce an Angel of a Stone, than to produce him out of nothing; because to make an Angel out of a Stone; (so far as it can be done) the Stone must be annihilated, and afterwards the Angel Created; But simply to Create an Angel, nothing is to be annihilated. If therefore the Mind produces its Idea's from the material Impressions which the Brain receives from Objects, it must always do the same thing, or a thing as difficult, or even more difficult than if it Created them; since Idea's being Spiritual, they cannot be produc'd of material Images, which have no proportion with them.

But if it be said, that an Idea is not a Substance, I consent to it, yet it is always something that is Spiritual; and as it is impossible to make a Square of a Spirit, although a Square be not a Substance from a Spiritual Idea, although an Idea was no Substance.

But although we should grant to the Mind of Man a Sovereign Power to Annihilate, and Create the Idea's of things, yet it would never make use of that Power to produce them; for even as a

Painter, how skilful soever he be, could not represent an Animal which he had never seen, and of which he never had any Idea: So that the Picture which he should make, should be like to this unknown Animal. Thus a Man cannot form the Idea of an Object, if he knew it not before, that is, if he has not already had some Idea of it, which does not depend upon his Will; and if he already had an Idea of it, he certainly knows this Object, and it would be unnecessary for him to Form it anew. It is therefore in vain to attribute to the Mind of Man the Power of producing his Idea's. It might be said perhaps, that the Mind of Man hath general and confused Idea's which it does not produce; and that those which it produces are particular, more clear and distinct; but it is always the same thing. For even as a Painter cannot draw the Picture of a particular Person, so as to be sure that he hath perfected it, if he had had no distinct Idea of him; and even if the Person had not been present: Thus the Mind, for example, which could only have the Idea of a Being, or an Animal in general, could not represent to its self a Horse, nor Form a distinct Idea of one, and be assured that it is perfectly like a Horse, if it had not already the first Idea with which it might compare this second: Now if it had a first, it is unuseful to Form a second; and the Question respects this first. Therefore, etc.

It's true, that when we conceive a Square by pure Intellection, we can also imagine it, that is, perceive it in our selves, by tracing an Image of it in the Brain; yet it must be first observ'd, that we are not the true nor principal Cause of this Image: But it will be too long to explain it here. Secondly, So far is the second Idea which accompanies this Image, from being more distinct and more exact than the other, that on the contrary, it is not so Exact, because it resembles the first, which was only a pattern for the second. For indeed we must not believe that the Imagination and Senses represent Objects more distinctly to us than the pure Understanding; but only that they apply them more to the Mind; for the Idea's of the Senses and Imagination are not distinct, but only so far as they are conformable to the pure Intellection: The Image of a Square for example, which the Imagination Traces in the Brain, is not exact and perfect, but only so far as it resembles the Idea of the Square, which we conceive by pure Intellection. It is this Idea which regulates this Image, 'tis the Mind which Conducts the Imagination; and which Obliges it, if we may so say, to behold from time to time, whether the Image it Paints, be a Figure of four right and equal Lines, whose Angles are alike. In a word, whether what it Imagines, is like to what it Conceives.

After what has been said, I do not believe it can be doubted, but those are deceived, who affirm, the Mind is able to Form the Idea's of Objects; since they attribute the Power of Creation to the Mind, and even of Creating with Wisdom and Order, although it has no knowledge of what it does; for that is not Conceivable: But the cause of their Error is, that Men always Judge that a thing is the Cause of some Effect, when both are joined together, supposing the true Cause of this Effect be unknown to them. That makes all the World conclude, that a Bowl put in Motion, and meeting another, is the true and principal Cause of the Motion that it communicates to it; as the Will of the Soul is the true and principal Cause of the Motion of the Arm, and other the like prejudices; because it always happens, that a Bowl is shaken when it is met by another that runs against it: As our Arms are moved almost always when we Will, and we do not see any other apparent Cause of this Motion.

But when an Effect does not so often follow something which is not the Cause of it, there is nevertheless a great many Men, who believe this thing is the Cause of the Effect which happens; yet every Body is not guilty of the same Error. For instance, if a Comet appears, and after this Comet a Prince Dies: Some Stones lie exposed to the Moon, and they are eaten with Worms: The Sun is joined with Mars at the Nativity of a Child, and something extraordinary happens to this Child: All this is enough to perswade a great many Men, that the Comet, the Moon, and the Conjunction of the Sun with Mars, are the Causes of these Effects, and others like them; and the reason why all the World does not believe it, is that they do not always see these Effects follow these Causes.

But all Men having commonly the Idea's of Objects present to their Minds as soon as they with it, and it happening many times in a day, almost all conclude that the Will which accompanies the production, or rather the presence of Idea's, is truly the Cause of them: Because they see nothing in the same time that they can attribute it to; and they imagine the Idea's no longer Exist, when the Mind sees them no longer; and that they revive again anew, when they are again represented to the Mind.

'Tis for these Reasons some Judge, that External Objects emit Images which resemble them, as we have mention'd in the precedent Chapter: For it being impossible to see Objects by themselves, but only by their Idea's, they judge the Object produces the Idea; because as soon as it is present they see it; and as soon as absent they see it no longer; and because the presence of the Object almost always accompanies the Idea which represents it to us.

Yet if Men were not prejudiced in their Judgments from this, that the Idea's of things are present to their Mind as soon as they Will them, they should only conclude, that according to the Order of Nature, their Will is commonly necessary for them to have those Idea's. Not that the Will is the true and principal Cause which presents them to the Mind, and much less, that the Will produces them from nothing, or after the manner they explain it. Nor ought they to conclude, that Objects emit Species resembling them, because the Soul commonly perceives them only when they are present; but only that the Object is for the most part necessary, in order to the Idea's being present to the Mind. And lastly, that a Bowl put into Motion, is the principal and true Cause of the shaking of another Bowl that it meets in the way, since the first had not the power of Motion in its self. They can only determine, that the meeting of two Bowls is an occasion to the Author, of the Motion of Matter to execute the Decree of his Will, which is the Universal Cause of all things, in communicating to the other Bowl a part of the Motion of the first; that is, to speak more clearly, in willing that the last should acquire so much more Motion as the first lost; for the moving force of Bodies can proceed only from the Will of him who preserves them, as we shall shew elsewhere.

CHAPTER 4: That we do not see Objects by the Means of Idea's which were created with us. And that God does not produce them in us so often as we have occasion for them.

THE Third Opinion is, That of those who say all Idea's are created with us.

To discover the Improbability of this Opinion, it will be necessary to consider that there is many different things in the World of which we have Idea's. But to speak only of simple

Figures, it is certain that the Number of them is Infinite: Nay, even if we consider but one only, as the Ellipsis, we cannot doubt but the Mind conceives an infinite Number of different Kinds of them, when it considers that one of the Diameters may be lengthened out to Infinity, and the other always continue the same.

So the height of a Triangle may be augmented or diminished infinitely, the base being always the same, we may conceive there is an infinite Number of different Kinds of them: And also, which I desire may be consider'd here, The Mind in some manner perceives this infinite Number, although we can imagine but very few of them; and that we can at the same time have particular and distinct Idea's of many Triangles of different Kinds. But what must chiefly be observed is, That this general Idea that the Mind has of this Number of Triangles of different Kinds is sufficient to prove, That if we do not conceive each of these different Triangles by particular Idea's: And in short, If we comprehend not their Infinity, 'tis not the Defect of the Idea's, or that Infinity is not represented to us, but only the Defect of the Capacity and Extension of the Mind. If a Man should apply himself to consider the Properties of all the diverse Kinds of Triangles, although he should eternally continue this sort of Study, he would never want new and particular Idea's, but his Mind would be unprofitably fatigued.

What I have said of Triangles, may be applied to five, six, a hundred, a thousand, or ten thousand sided Figures, and so on ad infinitum. Now if the sides of a Triangle, which have infinite relations one with the other, make Triangles of infinite Kinds, it is plain that four, five, or a thousand sided Figures are capable of admitting much greater Differences, since they are capable of a greater Number of Relations and Combinations of their sides, than simple Triangles are.

The Mind then sees all these things; it hath Idea's of them; and these Idea's would never fail it, although it should employ infinite Ages in the Consideration of one Figure only: And if it perceived not these infinite Figures all of a sudden, or comprehended not their Intinity, 'tis only because its Extension is very much limited. It hath then an infinite Number of Idea's: Do I say an infinite Number? It hath as many infinite Numbers of Idea's, as there are different Figures to be consider'd: So that since there is an infinite Number of different Figures, it's necessary that to know the Figures, the Mind have an infinitely infinite Number of Idea's.

Now I ask, If it's probable that God should Create so many things with the Mind of Man? For my part it does not appear so to me; chiefly, since that might be made in a more simple and easie manner, as we shall soon see. For as God always acts by the most simple ways, it does not seem reasonable to explain how we know Objects, by admitting the Creation of an infinite Number of Beings, since we can resolve this Difficulty in a more Easie and Natural way.

But although the Mind should have a Magazine of all the Idea's, which are necessary for it to see things, it would be yet more difficult to explain how the Soul should make choice of them to represent them: For instance, how it can represent the Sun to it self, whilst it is present to the Eyes of its Body?

For whereas the Image which the Sun imprints in the Brain, resembles not the Idea we have thereof, as has been elsewhere proved, and since the Soul perceives not the Motion that the Sun produces in the bottom of the Eyes, and in the Brain, it's inconceivable how it should exactly guess, amongst these infinite

Number of Idea's that it has, which it must represent to it self, to imagine or to see the Sun: We cannot therefore say, That the Idea's of things were created with us, it is sufficient that we see the Objects that are about us.

Nor can we say that God produces as many of them every Moment, as we perceive different things; this has been sufficiently resuted from what has been said in this Chapter. Besides it is necessary that at all times we actually have in our selves the Idea's of all things, since we are always able to think of all things; which we could not if we perceiv'd them already confusedly; that is, If an infinite Number of Idea's were not present to our Minds; for we cannot will to think of Objects, of which we have no Idea.

CHAPTER 5: That the Mind neither sees the Essence, nor Existence of Objects, in considering its own Perfections. That none but God sees them in that manner.

THE Fourth Opinion is, That the Mind stands in need of nothing besides it self, to perceive Objects; and that it can, in considering it self and its own Perfections, discover all things that are without it.

It is certain that the Soul sees within it self, and without Idea's, all the Sensations and Passions it is capable of, as Pleasure, Pain, Cold, Heat, Colours, Sounds, Odours, Sapors, its Love, its Hatred, Joy and Sadness, etc. because all the Sensations and Passions of the Soul represent nothing External which is like them; and because they are only Modifications, which nothing but the Mind is capable of. But the Difficulty is, to know whether the Idea's which represent something that is without the Soul, and which resembles them in some measure, as the Idea's of a Sun, a House, a Horse, a River, etc. are only Modifications of the Soul; insomuch that the Soul cannot stand in need of any thing besides it self, to represent to it self all External Things.

There are Persons who make no Scruple to affirm, That the Soul being made to think, it has in it self, I mean, in considering its own Perfections, whatever is necessary to perceive Objects; for indeed the Soul being nobler than all the things it conceives distinctly, it may be said, that it contains them in some measure Eminently, according to the Notions of the Schools; that is, after a Nobler and more Sublime Manner than they are in themselves. They pretend, that thus Superior things comprehend the Perfections of those that are Inferior. And thus being the Noblest of the Creatures they know; they fancy they have in themselves, after a Spiritual Manner, all that is in the visible World. In a word, They will have the Soul to be like an Intelligible World, which comprehends in it self, whatever the Material and Sensible World comprehends; nay, Infinitely more.

But in my Opinion it is a great Presumption to maintain that Thought: If I am not mistaken, it is Natural Vanity, the Love of Independence, and the Desire of resembling him who comprehends all Beings in himself, which Confounds the Mind, and inclines us to believe, we possess what we have not: Do not say that you are a :ogjt tp upir se;f. saus St/ Aistom; for there is none but God who is a Light to himself, and who can, in considering himself, see whatever he has produced, or can produce.

It is certain that there was none but God alone before the World was Created, and he could not produce it without Knowledge and without Idea's: Consequently those Idea's which God had of

the World, are not different from himself; and thus all Creatures, even the most Material and most Terrestrial, are in God, though in a manner altogether Spiritual, which we cannot apprehend. God therefore sees all Beings in himself, in considering his own Perfections which represent them to him. He also knows their Existence perfectly, for since the Existence of all things depend on his Will, he cannot be Ignorant of his own Will; it follows then, that he cannot be Ignorant of their Existence. And thus God does not only see in himself the Essence of all things, but also their Existence.

But the case is different as to Created Spirits, they can neither see the Essence of things, nor their Existence within themselves: They cannot see their Essence within themselves, because being very much limited, they do not contain all Beings, like God whom we may call the Universal Being, or plainly He that is, as he calls himself. Since therefore the Humane Mind may know all Beings and Infinite Beings, and yet not contain them, it is a certain Proof, that it does not see their Essence in it self. For the Mind does not only see sometimes one thing, and sometimes another successively, it also actually perceives Infinity though it does not comprehend it. So that not being actually Infinite, nor capable of Infinite Modifications at the same time, it is absolutely Impossible that it should see within it self what is not there. Therefore it does not see the Essence of things in considering its own Perfections, or by modifying it self diversely.

Neither does it see their Existence within it self, because the Existence of Beings do not depend upon its Will; and because the Idea's of those Beings may be present to the Mind, though they do not Exist; for everybody may have the Idea of a Mountain of Gold, though there be no Mountain of Gold in Nature: And though we rely on the report of the Senses to judge of the Existence of Objects; nevertheless Reason does not assure us, that we should always believe our Senses, since we find clearly that they deceive us. When a Man's Blood, for instance, is very much inflam'd; or barely when he Sleeps, he sometimes beholds Fields, Combats, and the like, which nevertheless are not present, and which perhaps never were. Therefore it is certain that it is neither within it self, nor by it self, that the Mind sees the Existence of things, but that in this case it depends upon some other things.

CHAPTER 6: That we see all things in God.

WE have examin'd in the preceding Chapter four different Manners in which the Humane Mind may see External Objects, which do not appear probable to us: There only remains the Fifth, which alone appears consonant to Reason, and the most proper to shew the Dependence that Spirits have on God in all their Thoughts.

In order to apprehend it rightly, we must remember what has been said in the preceding Chapter, that it is absolutely necessary that God should have in himself the Idea's of all the Beings he has created, since otherwise he could not have produced them; and that thus he sees all those Beings, by considering the Perfections which he includes in himself, and to which all Beings are related. Moreover, it is necessary to know that God is very strictly united to our Souls by his Presence, so that we may say that he is the place of Spirits, as Space is the place of Bodies. These two things being supposed, it is certain that the Mind may see what there is in God, which represents Created Beings, since that is very Spiritual, very Intelligible, and most present to

the Mind. Thus the Mind may see in God the Works of God, supposing God be willing to discover to it what there is in him which represents them. These are the Reasons which seem to prove, that he rather Wills than Creates an Infinite Number of Idea's in every Mind.

First, Although we do not absolutely deny, that God was able to produce an Infinitely infinite Number of Beings, which represent Objects with every Mind he Creates; yet we ought not to believe that he does so. For it is not only consonant to Reason, but it also appears by the Oeconomy of Nature, that God never does by very difficult means, what may be done by a plain easie way: God does nothing in vain and without Reason: That which shews his Wisdom and his Power, is not to do little things by difficult Means; for that is repugnant to Reason, and shews a limited Knowledge: But on the contrary, it is to do great things by plain easie Means. 'Tis thus that out of Extension only he produces whatever we see that is admirable in Nature, and even that which gives Life and Motion to Animals. For those who will needs have Substantial Forms, Faculties, and Souls in Animals, different from their Blood, and from the Organs of their Body, in order to perform their Functions, at the same time seem to argue that God wants Understanding, or that he cannot do those admirable things by Extension only. They measure the Power of God, and his Sovereign Wisdom, by the smallness of their own Capacity. Then since God may make Humane Minds see all things, by willing barely that they should see what is in themselves; that is, what is in him that has a relation to those things, and which represents them, there is no probability that he would do it otherwise; and that he should produce, in order thereunto, as many Infinities of Infinite Numbers of Idea's, as there are Created Spirits.

But we must observe, that we are not to conclude, that Spirits see the Essence of God, because they can see all things in God in that manner: Since what they see is very Imperfect; but that God is very Perfect: They see Matter Divisible and Figured, etc. and there is nothing in God that is Divisible or Figured; for God is all Beings, because he is Infinite and Comprehends all; but he is no Being in particular. Nevertheless that which we see is but one, or several Beings in particular, and we do not apprehend that perfect Simplicity of God which includes all Beings. Besides that it may be said, that we do not so much see the Idea's of things, as the things which those Idea's represent; for when we see a Square, for instance, we do not say that we see the Idea of that Square, which is united to the Mind, but only the Square which is without us.

The Second Reason which may induce us to believe, that we see all Beings, because God Wills, that that which is in him, which represents them, should be discover'd to us; and not because we have as many Idea's created with us as we can see things; for this puts all created Spirits in an absolute dependence upon God, and the greatest that can be: For this being so, we cannot only see nothing, but what God is will we should see, but we can also see nothing, unless God himself shews it us. Non sumus sufficientes cogitare aliquid a nobis, tanquam ex nobis, sed sufficientia nostra ex Deo est. 'Tis God himself which instructs and enlightens Philosophers in that Knowledge which ungrateful Men call Natural, although it is an immediate gift from Heaven: Deus enim illis manifestavit. It is he that is properly the Light of the Mind, and the Father of Light or Knowledge. Pater Luminum. It is he that teaches Wisdom to Men: Qui docet hominem scientiam. In a word, He is the true Light,

which enlightens all those that come into this World: Lux vera que illuminat omnem hominem venientem in bunc Mundum.

For in fine, It is pretty difficult distinctly to apprehend the Dependence which our Minds have on God in all their particular Actions, supposing they have all that which we distinctly know to be necessary for them in order to Act, or all the Idea's of things present to their Mind, and truly that general and confused word Concurrence, by which Men pretend to explain the Dependence that Creatures have on God, does not awaken any distinct Idea in an attentive Mind; and yet it is very necessary Men should know distinctly, that they can do nothing without God.

But the strongest of all Reasons, is the manner how the Mind perceives all things. It is certain, and every body knows by Experience, that when we have a mind to think on any thing in particular, we first cast our Eyes on all Beings; and in the next place we apply our selves to the Consideration of the Object we design to think on. Now it is most certain that we see it already, though confusedly and in general: So that as we may desire to see all the Beings, sometimes one and sometimes another, it is certain that all Beings are present to our Mind; and it appears that all Beings can only be present to our Mind, because God is present to it, that is, He who includes all things in the Simplicity of his Being.

It seems moreover, That the Mind would not be capable of representing to it self universal Idea's of Kinds and Species, etc. unless it saw all Beings included in one. For every Creature being a particular Being, we cannot say that we see any thing Created, when we see, for instance, a Triangle in general. In fine, I am of opinion, that it is impossible to give a good Reason of the Manner how the Mind comes to know several abstracted and general Truths, unless it be by the presence of him that can direct the Mind in a World of different Manners.

In fine, The Best, the most Sublime, the most Solid, and the chief Proof of the Existence of God, or that which supposes the fewest things, is the Idea we have of Infinity, though it does not comprehend it; and that it has a very distinct Idea of God, which it can only have by the Union it has with him; since it cannot be conceiv'd that the Idea of a Being infinitely perfect, as that we have of God, should be any thing that is Created.

But the Mind has not only the Idea of Infinity, it has it even before that of Finite. For we conceive the Infinite Being, from this alone that we conceive a Being, without considering whether it is Finite or Infinite. But in order to conceive a Finite Being, we must needs retrench something of that general Notion of a Being, which consequently must precede. Thus the Mind perceives nothing but in Infinity; and that Idea is so far from being form'd by the confused Mixture of all the Idea's of particular Beings, as Philosophers imagine; that on the contrary all those particular Idea's are only Participations of the general Idea of Infinity: As God does not derive his Being from the Creatures, but all Creatures only subsist by him.

The last Proof, which perhaps will be a Demonstration to those that are used to abstracted Arguments, is this, It is impossible that God should have any other principal End of his Actions but himself: It is a Notion that is common to all Men that are capable of any Reflection; and Holy Writ does not allow us to doubt, but that God has made every thing for himself. Therefore it is necessary, that not only our Natural Love, I mean the Motion he produces in our Mind, should tend towards him: But moreover, That the Knowledge and the Light which he bestows upon

it, should make us know any thing that is in him; for whatever comes from God can only be for God. Should God Create a Spirit, and give it for an Idea, or for the immediate Object of its knowledge the Sun: In my Opinion, God would Create that Spirit, and the Idea of that Spirit, for the Sun and not for him.

God cannot therefore Create a spirit to know his Works, unless that Spirit sees God in some measure, by beholding his Works. So that we may say, that unless we do see God in some measure, we should see nothing: In like manner, unless we do Love God, I mean, unless God did continually Imprint in us the Love of Good in general, we should Love nothing. For that Love being our Will, we can Love nothing, nor Will anything without him; since we cannot Love particular Goods, without determining towards those Goods, the motion of Love, which God gives us towards him. So that as we Love nothing but by the necessary Love we have for God, so we see nothing but by the Natural Knowledge we have of God: And all the particular Idea's we have of Creatures, are only Limitations of the Idea of the Creator, as all the Motions of the Will for the Creatures, are only determinations of the motion for the Creator.

I believe there are no Divines but what will grant, that the Impious Love God with that Natural Love I speak of: and St. Austin and some other Fathers affirm as an undeniable thing, That the Impious behold in God the Rule of Manners, and Eternal Truths. So that the Opinion I explain ought not to trouble any Body. Thus St. Austin speaks: Ab ida incommutabili luce veritatis, etiam impius, dum ab ea avertitur, quedammodo tangitur. Hinc est quod etiam impii cogitant eternitatem, & multa recte riprehendunt recteque laudant in bominum moribus. Quibus ea tandem regulis judicant, nisi in quibus vident, quemadmodum quisque vivere debeat, etiam si nec ipsi eodem modo vivant? Ubi autem eas vident? Neque enim in sua natura. Nam cum precul dubio mente ista videantur, corumque mentes constet esse mutabiles, bas vero regulai immutabiles, videa: quisquis in eis & Loc videre potuerit¥ubinam ergo sunt ishe regula Scripta, misi in libro lucis illiue, que veritas dicitur, unde lex omnis justa describitur¥inquavidet quid operandum sit, etiam qui operatur injustitiam, & ipse est qui ab illa luce avertitur a qua tamen tangitur.

There are many passages in St. Austin like unto this, by which he proves, that we see God even in this Life, by the knowledge we have of Eternal Truths. Truth is uncreated, Immutable, Immense, Eternal, above all things. It is true by it self. It derives its Perfection from nothing: It makes Creatures more perfect; and all Spirits naturally endeavour to know it. Nothing but God can have all those Perfections. Therefore Truth is God. We see some of those Immutable Eternal Truths. Therefore we see God. These are St. Austin's Reasons, ours differ a little from them; and we are unwilling to use the Authority of so great a Man unjustly, to second our Sentiment.

We believe that Truths, even those that are Eternal; as that twice two are four, are not so much as absolute Beings: So far are we from believing that they are in God. For it is visible, that that Truth only consists in a relation of Equality, which is between twice Two and Four. Therefore we do not say that we see God in seeing Truths, as St. Austin says, but in seeing the Idea's of those Truths: For Idea's are real, but the Equality between the Idea's, which is Truth, has no reality. When for example, Men say that the Cloth they measure contains Three Yards; the Cloth and the Yards are real: But the Equality between Three Yards and the Cloth is not a real Being; it is only a

relation that is between the Three Yards and the Cloth. When we say that twice Two are Four, the Idea's of the Numbers are real; but the Equality there is between them is only a Relation. Thus according to our Sentiment we see God, when we see Eternal Truths; not that those Eternal Truths are God, but because the Idea's on which those Truths depend are in God; perhaps St. Austin understood it so. We also believe, that we know in God Changeable and Corruptible things, although St. Austin only speaks of Immutable and Incorruptible things; because it is not necessary for that to place any Imperfection in God; since it suffices, as we have already said, that God should shew us what there is in him that has a Relation to these things.

But though I say, we see in God the things that are Material and Sensible, it must be observ'd, that I do not say we have a Sensation of them in God, but only that it is from God who Acts in us; for God Knows sensible things, but he does not Feel them. When we perceive any thing that is sensible, Sensation and pure Idea is in our Perception. Sensation is a Modification of our Soul, and it is God that Causes it in us: And he may Cause it, though he has it not, because he sees in the Idea he has of our Soul, that it is capable of it. As for the Idea which is joyn'd to Sensation, it is in God, we see it, because it is his pleasure to discover it to us: And God joins Sensation to the Idea, when Objects are present, to the end that we may believe them as they are: and that we may have such Sensations and Passions as we ought to have in relation the them.

Lastly, We believe that all Spirits see the Eternal Laws as well as other things in God, but with some difference: They know the Eternal Order and Eternal Truths, and even the Beings which God has made according to those Truths, or according to the Order by the Union which those Spirits have necessarily with the Word, or Wisdom of God which directs them, as we have shewn; But 'tis by the Impression they receive continually from the Will of God, which inclines them to him, and endeavours, as it were, to render their Will absolutely like unto his; that they know Order is a Law, I mean, that they know the Eternal Laws: How we must love Good, and shy from Evil: That we must love Justice more than all Riches: That it is better to Obey God than to Command Men, and many other Natural Laws. For the knowledge of all those Laws is not different from the knowledge of that Impression, which they always feel in themselves, though they do not always follow it by the free choice of their Will; which they know to be Common to all Spirits, though it is not equally strong in all.

It is by that Dependance, Relation, and Union of our Mind to the Word of God, and of our Will to his Love, that we are made after the Image and Likeness of God: And although this may be very much defac'd by Sin, yet it is necessary that it should subsist as long as we do. But if we bear the Image of the Word humbled upon earth; and if we follow the Motions of the Holy Ghost, that Primitive Image of our first Creation, that Union of our Mind with the Word of the Father, and to the Love of the Father and of the Son, will be re-established, and render'd indelible. We shall be like God, if we are like the Man God. In fine, God will be all in us, and we all in God, in a far more perfect manner than that by which it is necessary for us to subsist, that we should be in him, and he in us.

Here are some reasons which may perswade us, that Spirits perceive all things by the immediate Presence of him who Comprehends all in the Simplicity of his Being. Every one will Judge of it according to the Internal Conviction he shall receive of it, after having seriously consider'd it. But 'tis thought

that there will be no probability in all the other ways of explaining these things; and that this last will appear more than probable. Thus our Souls depend on God in all respects. For as it is he who makes them feel Grief, Pleasure, and all other Sensations, by the Natural Union he has Establish'd between them and our Body which is no other than his Decree and general Will. Thus it is he, who by the Natural Union which he has made between the Sill of Man, and the Representation of the Idea's which the Immensity of the Divine Being includes, that makes them know whatever they do know; and that Natural Union is also nothing else but his general Will. So that none but he can direct us, by representing all things to us; as none but he can make us Happy, by making us taste all manner of Pleasures.

Let us therefore keep to this Opinion, That God is the Intelligible World, or the place of Spirits, as the material World is the place of Bodies. That they receive all their Modifications from his Power: That they find all their Idea's in his wisdom: And that it is by his Love that they are acted in all their regular Motions; and since his Power and Love are nothing but himself, let us believe with St. Paul, that he is not far from every one of us; and that it is in him we have Life, Motion, and a Being. Non longe est ab unequoque nostrum, in ipso cnim vivimus, movemur, & sumius.

BOOK 6
THE SECOND PART

CHAP. III: Of the most dangerous Error in Philosophy. Of the Ancients.

Philosophers have not only spoke what they did not conceive, when they explained the Effects of Nature, by certain Beings which they have no particular Idea of, but even establish a Principle from whence may directly be drawn most false and dangerous Consequences.

For if, according to their Opinion, we suppose, that in Bodies there are some Beings distinct from Matter; and not having any distinct Idea of these Entities, we might easily imagine, that they are the true, or principal Causes of the Effects which we see produced. Tis even the common Sentiment of most Philosophers: For 'tis chiefly to explain these Effects, that they make use of Substantial Forms, Real Qualities, and other the like Entities. But when we come to consider attentively, the Idea we have of Cause or Power of acting, we cannot doubt but that it represents something Divine: For the Idea of a Sovereign Power, is the Idea of Sovereign Divinity; and the Idea of a Subordinate Power, is the Idea of an inferiour; but a true Divinity at least, according to the Opinion of the Heathens, if it be the Idea of a Power or true Cause. We admit therefore something Divine in all Bodies which encompass us, when we admit Forms, Faculties, Qualities, Vertues, and real Beings, capable of producing certain Effects, by the Power of their own Nature: And thus, they insensibly enter into the Opinions of the Heathens, by the Respect they have for their Philosophy. Faith indeed works it, but it may perhaps be said, that if we are Christians in our Hearts, we are Heathens in our Minds.

Moreover, it is difficult to perswade our selves, that we ought neither to love or fear, true Powers and Beings, who can act upon us, punish us with Pain, or recompense us with Pleasure. And as Love and Fear are a true Adoration, 'tis also difficult to perswade our selves that we ought not to adore them. For whatever

can act upon us, as a real and true Cause, is necessarily above us, according to St. Austin and right Reason: The same Father, and the same Reason tells us, 'tis an immutable Law that Inferiour things should submit to superiour. And from hence, this great Father concludes, that the Body cannot act upon the Soul, and that nothing can be above the Soul but God.

In the Holy Scriptures, when God proves to the Israelites, that they ought to adore him, that is, that they ought to fear and love him, the chief Reasons he brings, are taken from his Power, to recompence and punish them. He represents to them the Benefits they have received from him, the Evils wherewith he hath chastised them, and that he has still the same Power. He forbids them to adore the Gods of the Heathens, because they have no Power over them, and can do them neither Good nor Hurt. He requires them to honour him only, because he only is the true Cause of Good and Evil, and that there happens none in their City, according to the Prophet, which he has not done; for Natural Causes are not the true Causes of the Evil that appears to be done to us. 'Tis God alone that acts in them, and 'tis he only that we must fear and love: Soli Deo Honor & Gloria.

In short, this Opinion, that we ought to fear and love, whatsoever is the true Cause of Good and Evil, appears so natural and just, that it is impossible to destroy it; so that if we suppose this false Opinion of the Philosophers (which we endeavour here to confuse) that Bodies which encompass us are the true Causes of the Pleasures and Evils which we feel: Reason seems to juitine a Religion like to that of the Heathens, and approves of the universal Irregularity of Manners.

It is true, that Reason does not tell us that we must adore Onyons and Leeks, as the Sovereign Divinity; because they cannot make us entirely happy when we have of them, or entirely unhappy when we want them. Nor have the Heathens ever done to them so much Honour as to the great Jupiter, upon whom all their Divinities depend, or as to the Sun, which our Senses represent to us, as the universal Cause, which gives Life and Motion to all things, and, which we cannot hinder our selves from regarding as a Sovereign Divinity; if with the Heathen Philosophers, we suppose it includes in its being the true Causes of whatever it seems to produce, not only in our Bodies and Minds, but likewise in all Beings which encompass us.

But if we must not pay a Sovereign Honour to Leeks and Onyons, yet we may always render them some particular adoration: I mean, we may think of and love them in some manner; if it is true, that in some sort they can make us happy, we must honour them in Proportion to the Good they can do us. And certainly, Men who give Ear to the Reports of their Senses, think that Pulse is capable of doing them good; for else the Israelites, for instance, would not have regretted their Absence in the Defect, nor considered it as a Misfortune to be deprived of them, if they did not, in some manner, look upon themselves happy in the Enjoyment of them. These are the Irregularities which our Reason engages us in, when it is joyned to the Principles of the Heathen Philosophy, and follows the Impressions of the Senses.

That we may longer doubt of the Falseness of this Miserable Philosophy, and the Certainty of our Principles, and Clearness of the Idea's we make use of: It is necessary, clearly to establish those Truths which are opposite to the Errors of the ancient Philosophy, and to prove, in short, that there is only one true Cause, because there is only one true God: That Nature, or the Power of every thing, proceeds only from the Will of God: That all Natural things are not true Causes, but only occasional ones;

and some other Truths which will be the Consequences of these.

It is evident that all Bodies, both great and small, have no power of removing themselves: A Mountain, an House, a Stone, a grain of Sand; and in short, the least or biggest Bodies we can conceive, have no power of removing themselves. We have only two sorts of Idea's, that of Bodies, and that of Spirits; whereas we ought to speak only of those things which we conceive we should reason according to these two Idea's. Since therefore the Idea we have of all Bodies, shows us that they cannot move themselves, it must be concluded that they are moved by Spirits only. But when we examine the Idea we have of all finite Minds, we do not see the necessary Connexion between their Wills and the Motion of any Body whatsoever it be: On the contrary, we see that there is none, nor can be any; whence we ought to conclude, if we will argue according to our Knowledge, that as no body can be able to move it self, so there is no created Spirit can be the true or principal cause of the Motion of any body whatever.

But when we think of the Idea of God, of a Being infinitely Perfect, and consequently Almighty, we know that there is such a Connexion between his Will, and the Motion of all Bodies, that 'tis impossible to conceive he should Will the Motion of a Body, that should not be moved: We must then say, that his Will only can move Bodies, if we will speak things as we conceive them, and not as we feel them. The moving force of Bodies therefore, is not in the Bodies which move, since this power of Motion is nothing else but the Will of God. Thus Bodies have no Action, and when a Bowl which is moved, by meeting it moves another, yet it communicates nothing of its own; for in itself it hath not the Impression that it communicates to the other: Yet a Bowl is the Natural Cause of the motion which it communicates. A Natural Cause then is not a real and true Cause, but only an occasional one, and which determined the Author o Nature to act after such and such a manner, in such and such an Occurrence.

It is certain, that 'tis by the motion of visible or invisible Bodies that all things are produced: For Experience teaches us, that Bodies, whose parts are in greatest Motion, always act more than others, and produce the greatest Change in the World. All the Powers of Nature then proceed from the Will of God: He has created the World because he willed it: Dixit & facta funt: He moves all things, and so produces all the Effects that we see happen; because he has also willed certain Laws, according to which Bodies communicate their Motions in their Rencounter; and because these Laws are Efficacious they act, and Bodies cannot act. There is therefore no Force, Power, or true Cause, in the Material and Sensible World, nor must we admit of Forms, Faculties, and real Qualities, to produce Effects that Bodies cannot; and to divide, with God, the Force and Power which is Essential to him. Not only Bodies cannot be the true Causes of any thing, the most noble Spirits also are under a like Impotence. They can know nothing if God does not enlighten them; nor can they have any Sensation if he does not modifie them. They are capable of willing nothing if God moves them not towards him. I confess they can determine the Impression that God gives them towards him, to other Objects; but I know not whether that can be called a Power. If the Capability of Sinning is a Power, it would be a Power which the Almighty has not. St. Austin says in some of his Works, If Men had in themselves the Power of loving Good, we might say they had some Power: But can only Love, because God Wills they should Love, and because his Will is Efficacious. They Love only, because God continually inclines them to Good in General; that is, towards himself: For God has created them only

for himself, he never preserves them without turning them towards and inclining them to himself. They have no Motion towards Good in general, 'tis God who moves them; they only follow by an entire free Choice, this Impression according to the Law of God, or determine it towards a false Good after the Law of the Flesh: They can only be determined by a Prospect of Good: For being able to do only what God makes them, they can love nothing but Good.

But if we should suppose what is true in one Sense, that Spirits have in themselves the Power of knowing Truth and loving Good, if their Thoughts and Wills produced nothing External, we might always say they were able to do nothing. Now it appears most certain to me, that the Will of Spirits is not capable of moving the least Body in the World: For 'tis evident there is no necessary Connexion between the Will we have of moving our Arms, and the Motion of them. It is true, they are moved when we please, and by that means we are the Natural Cause of their Motion: But Natural Causes are not true Causes, they are only Occasional ones, which act merely through the Power and Efficacy of God, as I have already explained.

For how can we move our Arms? To move them we must have Animal Spirits, and convey them by certain Nerves, into such and such Muscles to swell and contract them. For by this means the Arms move; or according to the Opinion of some, we know not yet how 'tis performed: And we see, that Men who do not so much as know they have Spirits, Nerves, and Muscles to move their Arms, yet move them with as much Art and Facility, as those that understand Anatomy best. 'Tis then granted, that Men Will the Motion of their Arms, but 'tis only God that can and knows how to remove them. If a Man cannot throw down a Tower, at least he knows well what must be done in order to it: But there is no Man that knows so much, as what he must do to move one of his Fingers by the help of his Animal Spirits. How then can Men move their Arms? These things appear evident to me, and to all those that will think of them, though perhaps they may be incomprehensible to such as will not consider them.

But Men only are not the True Causes of the Motions produced in their Bodies, it seems even a Contradiction that they should be so. A True Cause is such an one as the Mind perceives a necessary Connexion between it and its Effect; 'tis that I mean. Now there is only the Infinitely Perfect Being, whose Mind can perceive a necessary Connexion between his Will and the Effects of it. 'Tis only God then, who is the True Cause, and who has really the Power of moving Bodies. I say moreover, 'tis not probable that God should communicate, either to Men or Angels, this Power he has of moving Bodies; and those who pretend the Power we have of moving our Arms is a true Power, must confess that God can also give to Spirits the Power of creating, annihilating, and performing all possible things: In a word, That he can make them Almighty, as I shall further shew.

God has no need of any Instrument to act, it is sufficient if he Wills a thing for it to be, because it is a Contradiction to suppose he Wills it, and that it should not be. His Power then is his Will, and the communicating of his Power is a Communication of his Will. But to communicate his Will to a Man or an Angel, can signifie nothing else but Willing; some body, for instance, should be effectively moved when 'tis Will'd by a Man or an Angel. Now in this case I see two Wills which concur when an Angel would move a Body, that of God, and that of the Angel; and to know which of the two will be the true Cause of the Motion of this Body, we must know which it is that is Efficacious. There is a necessary Connexion between the Will of

God, and what he Wills. God Wills in this case, that a Body should move when it is willed by an Angel: There is a necessary Connexion therefore, between the Will of God and the Motion of this Body; and consequently 'tis God who is the true cause of the Motion of the Body, and the Will of the Angel only an occasional one.

But to shew it yet more clearly, let us suppose that God Wills it should happen quite contrary to what some Spirits desire; as we may think of Devils, or some other Spirits, who merit this Punishment; we cannot say in this case, that God communicates his Power to them, since they can do nothing that they would do. Yet the Wills of these spirits would be the Natural Causes of whatever Effects should be produced; as such Bodies should be moved to the Right Hand, because these Spirits would have them moved to the Left; and the desire of these Spirits would determine the Will of God to act, as our Wills to move the parts of our Bodies, determine the first Cause to move them: So that the Wills of Spirits are only occasional Causes.

Yet if after all these Reasons, we will still maintain, that the Will of an angel, which moves any body, should be a true Cause, and not an occasional one; it is plain that this same Angel might be the true Cause of the Creation and Annihilation of all things: For God could as well communicate to him his Power of Creating and Destroying Bodies, as that of moving them, if he will'd that things should be created and annihilated: In a word, If he will'd that all things should happen as the Angel wishes them, even as he Wills Bodies should move, as the Angel pleases. If it be said, that an Angel or a Man would be the true movers, because God moves Bodies when they with it; it may also be said, that a Man and an Angel may be true Creators, since God can create Beings when they will it: Nay, perhaps it might be said, that the most Vile Animals, or Matter of it self, should be the effective Cause of the Creation of any Substance; if we supposed as the Philosophers do, that God produces substantial Forms whenever the Disposition of Matter requires it. In fine, Because God has resolved from all Eternity in certain times to create such or such things, we might also say, that these times should be the Causes of the Creation of these Beings, as reasonably as to pretend, that a Bowl which meets another, is the true cause of the motion it communicates to it: Because God has determined by his general Will, which constituted the Order of Nature, that when two Bodies should meet there should be such and such a Communication of Motion.

There is then but one only true God, and he the one only true Cause: And we must not imagine, that which precedes and Effect, to be the true Cause of it. God cannot even communicate his Power to the Creatures, if we follow the Light of Reason; he cannot make them true Causes, because he cannot make them Gods. Bodies, Spirits, pure Intelligences, can all do nothing. 'Tis he who hath made these Spirits that illuminates and acts them. 'Tis he who has created the Heavens and the Earth, which regulates the Motions thereof. In short, 'tis the Author of our Being that executes our Wills, femel jussis, sewsper pares. He even moves our Arms when we make use of them against his Orders, for he complains by his Prophets, that we make him serve our unjust and criminal Desires.

All these little Heathen Divinities, and all these particular Causes of the Philosophers, are only Chymera's that the wicked Spirit endeavours to establish to ruin the Worship of the true God. It is not the Philosophy they have received from Adam, which teaches these things; 'tis that they have received

from the Serpent; for since the Fall, the Mind of Man is perfectly Heathenish. 'Tis this Philosophy which joyned to the Errors of the Senses, has made them adore the Sun, and which is still at this Day, the universal Cause of the Irregularity of the Mind, and Corruption of the Heart of Man. By their Actions, and sometimes by their Words; why say they, should we not love the Body, since the Body is capable of affording us all Pleasures? And why do we laugh at the Israelites, which regretted the Loss of the Garlick and Onyons of Egypt; since, in Effect, they were unhappy, by being deprived of what, in some Measure, could make them happy? But the new Philosophy, which they represent as a dismal thing, to affrighten weak Minds, that is despised and condemned without being understood. The new Philosophy, I say, since they are pleased to call it so, destroys all the Arguments of the Libertines, by the Establishment of the chiefest of its Principles, which perfectly agrees with the first Principle of the Christian Religion, that we must love and fear but one God, since there is only one God who can make us happy.

For if Religion teaches us, that there is but one true God, this Philosophy shews us there is but one true Cause. If Religion informs us, that all the Divinities of the Heathens are only Stones and Metals without Life and Motion: This Philosophy discovers to us also, that all second Causes, or all the Divinities of their Philosophy, are only Matter and inefficacious Wills. In short, if Religion teaches us, that we must not bow our Knees to false Gods. This Philosophy also tells us, that our Imaginations and Minds ought not to be prostituted to the Imaginary Greatness and Power of Causes, which are not true Causes: That we must neither love nor fear them, nor busie our selves about them; but think upon God only, see him, adore him, fear and love him in all things.

But this agrees not with the Inclination of some Philosophers: They will neither see nor think upon God: For since the Fall, there is a secret Opposition between God and Man: Men take Pleasure in erecting Gods after their own Fancy, they voluntarily love and fear the Fictions of their own Imagination, as they Heathens did the Works of their own Hands. They are like Children who tremble at their Companions, after they have daubed their Faces: Or if they will have a more Noble Comparison, although perhaps it be not so just, they resemble those famous Romans, who had some Fear and Respect for the Fictions of their own Minds, and foolishly adored their Emperors after they had let loose the Eagle when they deified them.

Editor's note: After the publication of George Berkeley *Principles* (1710) and *Three Dialogues* (1713), philosophy in Great Britain was dominated by Scottish philosophers until about 1850. The Scottish philosophical movement is usually described as beginning with Gershom Carmichael at around 1700, and concluding with William Hamilton (d. 1856). These 50 or so philosophers were university teachers at Edinburgh, Glasgow, Aberdeen, and at other smaller schools in Scotland. Unable to obtain university employment, Hume is the most notable exception to the list. McCosh believes that adherence to the inductive method of investigation is the distinctive feature found throughout Scottish Philosophy. More than 100 years after the its publication, McCosh's *Scottish Philosophy* remains the most comprehensive account of these philosophers. McCosh was born in 1811 in Ayshire, Scotland. He studied at the Universities of Glasgow and Edinburgh, and received his M.A. from the latter in 1834. He was a pastor for several years and instrumental in establishing the Free Church of Scotland. From 1868-1888 he was president of the College of New Jersey (Princeton University). He continued living there until his death in 1894. McCosh's other philosophical writings include *The Method of the Divine Government, Physical and Moral* (1850), *The Intuitions of the Mind* (1860), *An Examination of Mr. J.S. Mill's Philosophy* (1866), and *Realistic Philosophy Defended in a Philosophic Series* (2 vol., 1886-1887). McCosh was a harsh critic of both Mill's empiricism and Hamilton's idealism. Following Reid, he argued that intuitive mental principles shape our experiences and establish the authority of our fundamental beliefs.

PREFATORY NOTE.

T/HIS\ work has been with me a labor of love. The gathering of materials for it, and the writing of it, as carrying me into what I feel to be interesting scenes, have afforded me great pleasure, which is the only reward I am likely to get. I publish it, as the last, and to me the only remaining, means of testifying my regard for my country -- loved all the more because I am now far from it -- and my country's philosophy, which has been the means of stimulating thought in so many of Scotland's sons.

The English-speaking public, British and American, has of late been listening to divers forms of philosophy, -- to Coleridge, to Kant, to Cousin, to Hegel, to Comte, to Berkeley, -- and is now inclined to a materialistic psychology. Not finding permanent satisfaction in any of these, it is surely possible that it may grant a hearing to the sober philosophy of Scotland.

M. Cousin has remarked that the philosophy of Scotland is part of the history of the country. I have treated it as such; and I claim to have one qualification for the work: I am in thorough sympathy with the characteristic sentiments of my native land. I have farther tried to make my work a contribution to what {iv} may be regarded as a new department of science, the history of thought, which is quite as important as the history of wars, of commerce, of literature, or of civilization.

Some of these articles have appeared in the "North British Review," the "British and Foreign Evangelical Review," and the "Dublin University Magazine; " but the greater number are now given to the public for the first time, and all of them have been rewritten.

THE SCOTTISH PHILOSOPHY.

I.-- CHARACTERISTICS OF THE SCHOOL.

T/HE\ Germans have histories without number of their philosophy from Kant to Hegel, with not a few historical reviews of the later speculations. The French, too, have numerous sketches of the philosophy of their country generally, and of individual systems, such as that of Descartes. It is no way to the credit of British thought, and least of all to that of the Scotch metaphysicians, that we have not in our language a history of the Scottish school of philosophy. There are valuable notices of it, it is true, in Dugald Stewart's Historical Dissertation, and in his Eloges of Reid and Adam Smith; but Stewart is far too dignified and general in his style to be able to give an articulate account of the special doctrines of the different masters of the school, or a vivid picture of the times, with many of the marked characteristics of which he had no sympathy. The best history of the Scottish Philosophy is by a Frenchman, and has not been translated into English. We look on "Philosophic Ecossaise," the volume in which M. Cousin treats of the Scottish school, as containing upon the whole the most faultless of all his historical disquisitions. In his other volumes he scarcely does justice to Locke, whom he always judges from the evil consequences which have flowed from his philosophy on the continent, and he is not able to wrestle successfully with the powerful logical intellect of Kant; but he has a thorough appreciation of the excellencies of the Scottish metaphysicians, and, when he finds fault, his criticisms are always worthy of being considered. But it could not be expected of a foreigner, that he should thoroughly comprehend the state of Scotland when its peculiar philosophy arose, nor be able to estimate its relation to the national character; and the account given by M. Cousin is fragmentary, and critical rather than expository.

The Scottish Philosophy possesses a unity, not only in the circumstance that its expounders have been Scotchmen, but also and more specially in its method, its doctrines, and its spirit. It is distinguished by very marked and decided features, which we may represent as determined by the bones rather than the flesh or muscles.

1. It proceeds on the method of observation, professedly and really. In this respect it is different from nearly all the philosophies which went before, from many of those which were contemporary, and from some of those which still linger among us. The method pursued in Eastern countries, in ancient Greece and Rome, in the scholastic times, and in the earlier ages of modern European speculation, had not been that of induction, either avowedly or truly. No doubt, speculators have been obliged in all ages and countries to make some use of facts, in the investigation of both mind and matter. But in the earlier theosophies, physiologies, and philosophies, they looked at the phenomena of nature merely as furnishing a starting-point to their systems, or a corroboration of them; and their inquiries were conducted in the dogmatic, or deductive, or analytic manner, explaining phenomena by assumed principles, or bringing facts to support theories, or resolving the complexities of the universe by refined mental distinctions. This spirit had been banished from

physical science, first, by the great realistic awakening of the sixteenth century; then by the profound wisdom and far-sighted sagacity of Bacon; and, finally, by the discoveries of Newton and the establishment of the Royal Society of London. But it lingered for some ages longer in material science, from which it has not even yet been finally expelled. Bacon had declared, that his method was applicable to all other sciences as well as to the investigation of the material universe. "Does any one doubt (rather than object)," says he, "whether we speak merely of natural philosophy or of other sciences also, such as logics, ethics, politics, as about to be perfected by our method?" "We certainly," he replies, "understand all these things which have been referred to; and like as the vulgar logic, which regulates things by the syllogism, pertains not to the natural but all sciences, so ours, which proceeds by induction, embraces them all. For thus we would form a history and tables concerning anger, fear, modesty, and the like, as also examples of civil affairs, not omitting the mental emotions of memory, composition, division, judgment, and the rest, just as we form such of heat and cold, of light, vegetation, and such like." Sir Isaac Newton had said in his Optics: "And if natural philosophy in all its parts, by pursuing this method, shall at length be perfected, the bounds of moral philosophy will also be enlarged." But the employment of the method of induction in the study of the human mind was for ages slow, wavering, and uncertain. It has been asserted, that Descartes proceeded on the method of induction; but the statement has been made by metaphysicians who have never correctly apprehended the mode of procedure recommended by Bacon. Descartes does indeed appeal to profound ideas, which may be regarded as mental facts; but it is not by them to arrive at laws by a gradual generalization; it is rather to employ them as foundation-stones of his structure, which is reared high above them by the joint dogmatic and deductive method, and on the geometric and not the inductive plan. It has been averred that Hobbes proceeded on the method of his friend Bacon; but Hobbes nowhere professes to do so: his doctrine of the origin of civil government is a mere theory, and his system of the human mind and of morals is obtained by a very defective analysis, and in fact, is mainly borrowed from Aristotle, whose profounder principles he was incapable of appreciating. It cannot be denied that Locke does proceed very largely in the way of observation; but it is a curious circumstance that he nowhere professes to follow the method of induction; and his great work may be summarily represented as an attempt to establish by internal facts the preconceived theory, that all our ideas are derived from sensation and reflection. To the Scottish school belongs the merit of being the first, avowedly and knowingly, to follow the inductive method, and to employ it systematically in psychological investigation. As the masters of the school were the first to adopt it, so they, and those who have borrowed from them, are almost the only persons who have studiously adhered to it. The school of Condillac in France, and its followers in England {4} and Germany, do indeed profess to attend to observation, but it is after the manner of the empiricists, described by Bacon as beginning with experience, but immediately abandoning it for premature hypotheses. It will be seen, as we advance, that Kant

followed the critical and not the inductive method. Hutcheson and Turnbull, and especially Reid and Stewart, have the credit of announcing unambiguously, that the human mind is to be studied exclusively by the method of observation, and of consistently employing this mode of procedure in all their investigations.

II. It employs self-consciousness as the instrument of observation. It may thus be distinguished from some other schools with which it has been confounded. Bacon, we have seen, did believe in the applicability of his method to all the mental sciences. But he had no clear apprehension of the agency by which the observation is to be accomplished; he supposed it to be by " the history and tables concerning anger, fear, modesty, the memory, composition, division, judgment, and the like." In respect of the means of observation, philosophy is greatly indebted to Descartes, who taught men, in studying the human mind, to seize on great internal ideas. The questions started by Locke, and his mode of settling them, tend towards the same issue; he dwells fondly on reflection as the alone source of the ideas which we have of the workings of the human mind, and ever appeals to the internal sense as an arbiter in discussions as to the origin of ideas. But the Scottish philosophers took a step in advance of any of their predecessors, inasmuch as they professed to draw all the laws of mental philosophy -- indeed, their whole systems -- from the observations of consciousness.

By this feature they are at once distinguished from those who would construct a science of the human mind from the observation of the brain or nerves, or generally from animal physiology. Not indeed that the Scottish philosophy is required, by its manner or its principles, to reject the investigation of the functions of the bodily frame, as fitted to throw light on mental action. Certain of the masters of the school, such as Reid, Brown, and Hamilton, were well acquainted with physiology in its latest discoveries in their day, and carefully employed their knowledge to illustrate the operations of the human mind. {5} There is nothing in the method, or the spirit, or the cherished doctrines of the school tending to discountenance or disparage a painstaking experimental investigation of the parts of the bodily frame most intimately connected with mental action. Possibly the next great addition may be made to psychology, when internal observation of the thoughts and feelings, and external observation of the brain and nerves and vital forces, are in circumstances to combine their lights. But in the days of the great masters of the Scottish school, physiology was not in a state, nor is it yet in a position, to furnish much aid in explaining mental phenomena. The instrument employed by them was the internal sense; and they always maintained that it is only by it that we can reach an acquaintance with mind proper and its various operations, and that the knowledge acquired otherwise must ever be regarded as subordinate and subsidiary. They might have admitted that the occasion of the production, and the modifications of our mental states, could so far be influenced by the cerebro-spinal mass, or the forces operating in it; but they strenuously maintained that we can know what our perceptions, and judgments, and

feelings, and wishes, and resolves, and moral appreciations are, not by the senses or the microscope, not by chemical analysis, or the estimation of the vital forces, but solely through our inward experience revealed by consciousness.

But let us properly understand what the Scottish school intend when they maintain that a science of the human mind can be constructed only by immediate consciousness. They do not mean that the study of the mind can be prosecuted in no other way than by looking in for ever on the stream of thought as it flows on without interruption. The operation of introspection is felt to be irksome in the extreme if continued for any length of time, and will certainly be abandoned when thought is rapid or feeling is intense; and those who trust to it exclusively are apt to fix their attention on a few favorite mental states, and omit many others no less characteristic of the human mind. He who would obtain an adequate and comprehensive view of our complex mental nature must not be satisfied with occasional glances at the workings of his own soul: he must take a survey of the thoughts and feelings of others so far as he can gather them from their deeds and from their words; from the {6} acts of mankind generally, and of individual men, women, and children; from universal language as the expression of human cogitation and sentiment; and from the commerce we hold with our fellow-men by conversation, by writing, or by books. Reid in particular is ever appealing to men's actions and language, as a proof that there must be certain principles, beliefs, and affections in the mind. Still this evidence ever carries us back to consciousness, as after all both the primary witness and the final judge of appeal; as it is only by it, and by what has passed through our own minds, that we can come to discern and appreciate the feelings of our brother men.[2]

III. By the observations of consciousness, principles are reached which are prior to and independent of experience. This is another grand characteristic of the school, distinguishing it, on the one hand, from empiricism and sensationalism; and, on the other hand, from the dogmatism and <a priori> speculation of all ages and countries. It agrees with the former in holding that we can construct a science of mind only by observation, and out of the facts of experience; but then it separates from them, inasmuch as it resolutely maintains that we can discover principles which are not the product of observation and experience, and which are in the very constitution of the mind, and have there the sanction of the Author of our nature. These are somewhat differently apprehended and described by the masters of the school, some taking a deeper and others a more superficial view of them. Hutcheson calls them senses, and finds them in the very constitution of the mind. Reid designates them principles of common sense, and represents them as being natural, original, and necessary. Stewart characterizes them as fundamental laws of human thought and belief. Brown makes them intuitions simple and original. Hamilton views them under a great many aspects, but seems {7} to contemplate them most frequently and fondly after the manner of Kant, as <a priori> forms or conditions. But whatever minor or major differences there may be in the fulness of their exposition, or in the favorite views which

they individually prefer, all who are truly of the Scottish school agree in maintaining that there are laws, principles, or powers in the mind anterior to any reflex observation of them, and acting independently of the philosophers' classification or explanation of them. While the Scottish school thus far agrees with the rational and <a priori> systems, it differs from them most essentially, in refusing to admit any philosophic maxims except such laws or principles as can be shown by self-inspection to be in the very constitution of the mind. It has always looked with doubt, if not suspicion, on all purely abstract and rational discussions, such as that by which Samuel Clarke demonstrated the existence of God; and its adherents have commonly discountenanced or opposed all ambitious <a priori> systems, such as those which were reared in imposing forms in Germany in the end of last, and the beginning of the present, century.

These three characters are found, in a more or less decided form, in the works of the great masters of the school. I am not sure indeed whether they have been formally announced by all, nor whether they have always been consistently followed out. I allow that the relation of the three principles one to another, and their perfect congruity and consistency, have not always been clearly discerned or accurately expressed. In particular, I am convinced that most of the Scottish metaphysicians have not clearly seen how it is that we must ever proceed in mental science by observation, while there are at the same time in the mind laws superior to and independent of observation; how it is that while there are <a priori> principles in the mind, it is yet true that we cannot construct a philosophy by <a priori> speculation. But with these explanations and deductions, it may be maintained that the characters specified are to be found, either announced or acted on, in the pages of all the writers of the school, from Hutcheson to Hamilton. Whenever they are discovered in the works of persons connected with Scotland, the writers are to be placed among the adherents of the school. Wherever there is the total absence of any one of them, we cannot allow the author a place in the fraternity. {8}

The Scottish metaphysicians and moralists have left their impression their own land, not only on the ministers of religion, and through them upon the body of the people, but also on the whole thinking mind of the country. The chairs of mental science in the Scottish colleges have had more influence than any others in germinating thought in the minds of Scottish youth, and in giving a permanent bias and direction to their intellectual growth. We have the express testimony of a succession of illustrious men for more than a century, to the effect that it was Hutcheson, or Smith, or Reid, or Beattie, or Stewart, or Jardine, or Mylne, or Brown, or Chalmers, or Wilson, or Hamilton, who first made them feel that they had a mind, and stimulated them to independent thought. We owe it to the lectures and writings of the professors of mental science, acting always along with the theological training and preaching of the country, that men of ability in Scotland have commonly been more distinguished by their tendency to inward reflection than inclination to sensuous observation. Nor is it to be omitted

that the Scottish metaphysicians have written the English language, if not with absolute purity, yet with propriety and taste, -- some of them, indeed, with elegance and eloquence, -- and have thus helped to advance the literary cultivation of the country. All of them have not been men of learning in the technical sense of the term, but they have all been well informed in various branches of knowledge (it is to a Scottish metaphysician we owe the "Wealth of Nations"); several of them have had very accurate scholarship; and the last great man among them was not surpassed in erudition by any scholar of his age. Nor has the influence of the Scottish philosophy been confined to its native soil. The Irish province of Ulster has felt it quite as much as Scotland, in consequence of so many youths from the north of Ireland having been educated at Glasgow University. Though Scotch metaphysics are often spoken of with contempt in the southern part of Great Britain, yet they have had their share in fashioning the thought of England, and, in particular, did much good in preserving it, for two or three ages towards the end of last century and the beginning of this, from falling altogether into low materialistic and utilitarian views; and in this last age Mr. J. S. Mill got some of his views through his father from Hume, Stewart, and Brown, {9} and an active philosophic school at Oxford has built on the foundation laid b Hamilton. The United States of America especially the writers connected with the Presbyterian and Congregational Churches, have felt pleasure in acknowledging-, their obligations to the Scottish thinkers. It is a most interesting circumstance, that when the higher metaphysicians of France undertook, in the beginning of this century, the laborious work of throwing back the tide of materialism, scepticism, and atheism which had swept over the land, they called to their aid the sober and well-grounded philosophy of Scotland. Nor is it an unimportant fact in the history of philosophy, that the great German metaphysician, Emmanuel Kant, was roused, as he acknowledges, from his dogmatic slumbers by the scepticism of David Hume.

But the great merit of the Scottish philosophy lies in the large body of truth which it has -- if not discovered -- at least settled on a foundation which can never be moved. It has added very considerably to our knowledge of the human mind, bringing out to view the characteristics of mental as distinguished from material action; throwing light on perception through the senses; offering valuable observations on the intellectual powers, and on the association of ideas; furnishing, if not ultimate, yet very useful provisional classifications of the mental faculties; unfolding many of the peculiarities of man's moral and emotional nature, of his conscience, and of his taste for the beautiful; resolving many complex mental phenomena into their elements; throwing aside by its independent research a host of traditional errors which had been accumulating for ages; and, above all, establishing certain primary truths as a foundation on which to rear other truths, and as a breakwater to resist the assaults of scepticism.

In comparing it with other schools, we find that the transcendental speculators of Germany have started

discussions which they cannot settle, and followed out their principles to extravagant consequences, which are a <reductio ad absurdum> of the whole method on which they proceed. Again, the physiologists have failed to furnish any explanation of consciousness, of thought, of moral approbation, or of any other peculiar mental quality. Meanwhile, the philosophy of consciousness has coordinated many facts, ascertained many mental laws, {10} explained many curious phenomena of our inward experience, and established a body of intuitive truths. By its method of careful observation, and by it alone, can the problems agitated in the rival <a priori> schools be solved, so far as they can be solved by the human faculties. Whatever aid physiological research as it advances may furnish to psychology, it must always be by the study, not of the brain, and nerves, and vital forces, but of our conscious operations, that a philosophy of the human mind is to be constructed. Whether the Scottish philosophy is to proceed exclusively in its old method, and go on co-ordinating facts with ever-increasing care, and expressing them with greater and greater precision, or whether it is to borrow from other schools, -- say to resolve in its own way the questions started by Schelling and Hegel, or to call in physiology to account for the rise of mental states, -- it is at least desirable that we should now have a combined view of what has been accomplished by the philosophy of consciousness. This is what is attempted in this work.

It should be freely admitted that the Scottish school has not discovered all truth, nor even all discoverable truth, in philosophy; that it does not pretend to have done so is one of its excellencies, proceeding from the propriety of its method and the modesty of its character. Among the writings of the Scottish school, it is only in those of Sir William Hamilton that we find some of the profoundest problems of philosophy, such as the conditions of human knowledge and the idea of the infinite discussed; and the majority of the genuine adherents of the school are inclined to think that on these subjects his conclusions are too bare and negative, and that he has not reached the full truth. Reid and Stewart are ever telling us that they have obtained only partial glimpses of truth, and that a complete science of the human mind is to be achieved solely by a succession of inquirers prosecuting the investigation through a series of ages. Brown and Hamilton make greater pretensions to success in erecting complete systems, but this is one of the defects of these great men, arising, as we shall see, from their departing from the genuine Scottish method, and adopting, so far, other and continental modes of philosophizing, the one betaking himself to the empirical analysis of the French sensational school, and the other adopting the critical method {11} of Kant; and it is to be said in behalf of Brown, that he never mounts into a re.-lion of cloudy speculation; and in favor of Hamilton, that his most vigorous efforts were employed in showing how little can be known by man. All the great masters of the school not only admit, but are at pains to show, that there are mysteries in the mind of man, and in every department of human speculation, which they cannot clear up. This feature has tempted some to speak of the whole school with contempt, as doing little because attempting little. They have been

charged with their country's sin of caution, and the national reproach of poverty has been unsparingly cast upon them. Let them not deny, let them avow, that the charge is just. Let them acknowledge that they have proceeded in time past in the patient method of induction, and announce openly, and without shame, that they mean to do so in time to come. Let it be their claim, that if they have not discovered all truth, they have discovered and settled some truth -- while they have not promulgated much error, or wasted their strength in rearing showy fabrics, admired in one age and taken down the next. It is the true merit of Scotchmen that, without any natural advantages of soil or climate, they have carefully cultivated their land, and made it yield a liberal produce, and that they have been roused to activity, and stimulated to industry, by their very poverty. Let it, in like manner, be the boast of the Scottish philosophy, that it has made profitable use of the materials at its disposal, and that it has by patience and shrewdness succeeded in establishing a body of fundamental truth, which can never be shaken, but which shall stand as a bulwark in philosophy, morals, and theology, as long as time endures.

II. STATE OF SCOTLAND.

D/URING\ the seventeenth century, the three kingdoms had passed through a series of political and religious convulsions, and in the opening of the following century the Protestant people were seeking to enjoy and improve the seasonable -- as they reckoned it the providential -- rest which was brought by the Revolution Settlement. The floods had swept over the {12} country, partly to destroy and partly to fertilize, and men are busily employed in removing the evils (as they reckon them) which had been left, and in sowing, planting, and building on the now dry and undisturbed territory. In particular, there is a strong desire on the part of the great body of the people to make the best use of the peace which they now possess, and to employ it to draw forth the material resources of the country. As a consequence of the intellectual stimulus which had been called forth mainly by the previous great contests, and of the liberty achieved, and the industry in active exercise, the riches of the nation are increasing, agriculture begins to make progress, great commercial cities are aggregating, household and social elegance and comfort are sought after and in a great measure secured, refinement of manners is cultivated, and civilization is advancing. In the eager pursuit of these worldly ends, the Generation then springing up scarcely set sufficient value on the higher blessings which had been secured by the struggles of their forefathers. By the profound discussions of the seventeenth century, the great body of the people had been made to read their Bibles, and to inquire into the foundation and functions of political government. By the deeds done, by the sufferings endured, and the principles enunciated, the great questions of civil and religious liberty had been started, and opinions set afloat which were ultimately to settle them theoretically and practically. But the race now reared did not sufficiently appreciate the advantages thence accruing. They were kept from doing so by two impressions left by the terrible battles which had been fought on their soil.

Every one who has read the history of the period knows that a large amount of profligacy had prevailed among certain classes in the latter reigns of the Stuarts. The rampant vice led naturally to religious infidelity, and the two continued to act and react on each other. Self-indulgent men were little inclined to value the truths of spiritual religion, and lent their ears to plausible systems of belief or unbelief which left them undisturbed in their worldly enjoyments; while youths who had broken loose from the old religious trammels were often tempted to break through moral restraints likewise, and to rush into vice, as exhibiting spirit and courage. The great cavalier party, composed largely of the upper classes, and of {13} those who aspired to rise to them, had been all along in the habit of ridiculing the fervor and strictness of the puritan movement, which bad sprung up chiefly among the middle and better portion of the lower classes, and of describing all who made solemn pretensions to religion as being either knaves or fools. Many of those who had originally brought the charge did not believe it in their hearts, as they had been constrained to respect the great and good qualities of their opponents; but they succeeded in instilling their sentiments into the minds of their children, who were taught to regard it as a mark of a gentleman to swear and to scoff at all religion. From whatever causes it may have proceeded, it is certain that in the first half of the eighteenth century there is a frequent and loud complaint on the part of theologians, both within and beyond the Established Churches, of the rapid increase and wide prevalence of infidelity, and even of secret or avowed atheism.

The struggles of the seventeenth century had left another very deep sentiment. The sects had contended so much about minor points, that now, in the reaction, there was a strong disposition, both among the professedly religious and irreligious, to set little or no value on doctrinal differences, and to turn away with distaste from all disputes among ecclesiastical bodies. The indifference thence ensuing tended, equally with the mistaken zeal of the previous age, to prevent the principles of toleration from being thoroughly carried out. Those who stood up for what were esteemed small peculiarities were reckoned pragmatical and obstinate. Their attempts to secure full liberty of worship and of propagation met with little sympathy, and were supposed to be fitted to bring back needlessly the battles and the sufferings of the previous ages. The two sentiments combined, the desire to have a liberal or a loose creed, and the aversion to the discussion of lesser differences, issued in a result which it is more to our present purpose to contemplate. It led the great thinkers of the age, such as Samuel Clarke, Berkeley, and Butler, to spend their strength, not so much in discussing doctrines disputed among Christians, as in defending religion in general, and in laying a deep foundation on which to rest the essential principles of morality and the eternal truths of religion, natural and revealed. The first age of the eighteenth century, as it was the period {14} in which the first serious attacks were made on Christianity, so it was also the time in which were produced the first great modern defences of religion, natural and supernatural. Men of

inferior philosophical breadth, but of eminent literary power, such as Addison, were also employing their gifts and accomplishments and contributing to what they reckoned the same good end, by writing apologies in behalf of religion, and laboring to make it appear amiable, reasonable, and refined. These same causes led preachers of the new school to assume a sort of apologetic air in their discourses, to cultivate a refined language, moulded on the French, and not the old English model, to avoid all extravagance of statement and appeal, to decline doctrinal controversy, and to dwell much on truths, such as the immortality of the soul, common to Christianity and to natural religion, and to enlarge on the loveliness of the Bible morality. The manner and spirit were highly pleasing to many in the upper and refined classes were acceptable to those who disliked earnest religion, as they had nothing of "the offence of the cross;" and were commended by some who valued religion, as it seemed to present piety in so attractive a light to their young men, about whom they were so anxious in those times, and of whom they hoped that they would thus be led to imbibe its elements, and thereby acquire a taste for its higher truths. But all this was powerless on the great body of the people, who were perfectly prepared to believe the preacher when he told them that they were sinners, and that God bad provided a Saviour, but felt little interest in refined apologies in behalf of God and Christ and duty; and they gradually slipped away from a religion and a religious worship which had nothing to interest, because they had nothing to move them. All this was offensive in the extreme to those who had been taught to value a deeper doctrine and a warmer piety. They complained that when they needed food they were presented with flowers; and, discontented with the present state of things, they were praying for a better era.

To complete the picture of the times, it should be added that there was little vital piety among the clergy to counteract the tendency to religious indifference. The appointments to the livings in England and Ireland lay in the hands of the government and the upper classes, who preferred men of refinement {15} and prudence, inclined to political moderation or subserviency, to men of spiritual warmth and religious independence. The Nonconformists themselves felt the somnolent influence creeping over them, after the excitement of the battle in which they had been engaged was over. Their pastors were restrained in their ministrations, and consequently in their activities, by laws which were a plain violation of the principles of toleration, but which, as they did not issue in any overt act of bitter persecution, were not resented with keenness by the higher class of Dissenters, who, to tell the truth, after what they had come through in the previous age, were not much inclined to provoke anew the enmity from which they had suffered, but were rather disposed, provided only their individual convictions were not interfered with, to take advantage of what liberty they had, to proclaim peace with others, and to embrace the opportunities thrown open to them in the -- rowing cities and manufactories, of promoting the temporal interests of themselves and their families. In these circumstances, the younger ministers were often allured (as Butler was) to go over to the Established Church; and those who remained were infected with the spirit

which prevailed around them, and sought to appear as elegant and as liberal as the clergy of the church, who were beginning to steal from them the more genteel portion of the younger members of their flocks. The design of those who favored this movement was no doubt to make religion attractive and respected. The result did not realize the expectation. The upper classes were certainly not scandalized by a religion which was so inoffensive, but they never thought of heartily embracing what they knew had no earnestness; and, paying only a distant and respectful obeisance to religion in the general, they gave themselves up to the fashion. able vices, or, at best, practised only the fashionable moralities of their times. The common people, little cared for by the clergy, and caring nothing for the refined emptiness presented to them instead of a living religion, went through their daily toils with diligence, but in most districts, both of town and country, viewed religion with indifference, and relieved their manual labor with low indulgences. England is rapidly growing in wealth and civilization, and even in industry, mainly from the intellectual stimulus imparted by moral causes acting in the {16} previous ages; but it is fast descending to the most unbelieving, condition to which it has ever been reduced. From this state of religious apathy it is roused, so far as the masses of the people are concerned, in the next age, and ere the life had altogether died out, by the trumpet voices of Whitfield and Wesley. It was in a later age, and after the earthquake convulsions of the French Revolution had shaken society to its foundation, that the upper classes were made to know and feel that when " the salt has lost its savor," it is good for nothing but to be cast out and trodden under foot of men, and that a dead religion is of no use either to rich or poor, either for political ends or for personal comfort.

An analogous, but by no means identical, process begins and goes on, and is consummated in Scotland about half an age or an age later in point of time. All throughout the seventeenth century, Scotland, like England, had been ploughed by religious contests. But the penetrating observer notices a difference between the shape taken by the struggle in the two countries. In England, the war had been a purely internal one between opposing principles, the prelatic and puritan; whereas, in Scotland, the battle had been mainly against an external foe, that is, an English power, which sought to impose a prelatic church on the people contrary to their wishes. Again, in England the contest had been against an ecclesiastical power, which sought to crush civil liberty; whereas, in Scotland, the power of the Church of Scotland had been exerted in behalf of the people, and against a foreign domination. This difference in the struggle was followed by a difference in the state of feeling resulting when the contest was terminated by the accession of William and Mary.

The great body of the people, at least in the Lowlands, acquiesced in the Revolution Settlement, and clung round the Government and the Presbyterian Church as by law established. But there soon arose antagonisms, which, though they did not break out into open wars, as in the previous century, did yet range the country into sections and parties

with widely differing sympathies and aims. In fact, Scotland was quite as much divided in opinion and sentiment in the eighteenth, as it ever was in the seventeenth century. In saying so, I do not refer to the strong prelatic feeling which existed all over the north {17} east coast of Scotland, or to the attachment to the house of Stuart which prevailed in the Highlands, -- for these, though they led to the uprisings of 1715 and 1745, were only the backward beatings of the retreating tide, -- but to other and stronger currents which have been flowing and coming into more or less violent collision with one another from that day till ours.

At the close of the seventeenth and beginning of the eighteenth century, the Church of Scotland was composed of a somewhat heterogeneous mixture of covenanting ministers, who had lived in the times of persecution; of prelatic clergy whose convictions in favor of Episcopacy were not sufficiently deep to induce them to abandon their livings, and to suffer the annoyances and persecutions to which the more sincere non jurors were exposed and of a race of young men zealous for the Presbyterian establishment, but "only half educated and superficially accomplished." The conforming "curates" were commonly indifferent to religion of every kind, and it was hoped that they would soon die out, and that the heritors and elders, with whom the election of pastors lay, would fill the churches with a learned and zealous ministry. But, in 1711, the Jacobite government of Queen Anne took the power of election from the parish authorities, and vested it in the ancient patrons, being the Crown for above five hundred and fifty livings, and noblemen, gentlemen of landed property, and town-councils, for the remaining four hundred.[3] The effect of this new law became visible in the course of years, in the appointment of persons to the churches who, for good reasons or bad, were acceptable to the government of the day, or were able to secure the favor of the private patrons. Forced upon the people in the first instance, there was a public feeling ready to gather round this law of patronage. From bad motives and from good -- like those which we have traced in England -- there was a desire among the upper, and a portion of the middle and educated, classes to have a clergy suited to the new age which had come in. As the result, there was formed a type of ministers which has continued till nearly our time in Scotland, called "New light" by the people, and designating themselves " moderates," as claiming the virtue of being moderate in all things, though, as Witherspoon charges {18} them, they became very immoderate for moderation, when they rose to be the dominant party. Most of them refrained in their preaching from uttering a very decided sound on disputed doctrinal points; some of them were suspected of Arianism or Socinianism, which, however, they kept to themselves out of respect for, or fear of, the Confession of Faith, which they had sworn to adhere to; the more highly educated of them cultivated a refinement and elegance of diction, and dwelt much on the truths common to both natural and revealed religion; and all of them were fond of depicting the high morality of the New Testament, and of recommending the example of Jesus. It is scarcely necessary to remark, that this style of preaching did not gain, as it did not warm, the hearts of the common people,

who either became callous to all religion, without any zealous efforts being made to stir them up, or longed and prayed for a better state of things. The enforcement of the law of patronage, and the settlement of ministers against the wishes of the people, led to the separation of the Erskines and the Secession Body in 1733, and of Gillespie and the Relief Body in 1753. In the Established Church there still remained a number of men of evangelical views and popular sympathies, such as Willison and Boston, who hoped that they might stem and ultimately turn the tide which was for the time against them. The boast of the moderate party was, that they were introducing into Scotland a greater liberality of sentiment on religious topics, and a greater refinement of taste. The charge against them is, that they abandoned the peculiar doctrines of the gospel, that they could not draw towards them the affections of the people who, in rural districts, sank into a stupid ignorance of religious truth, and, in the crowded lanes of the rising cities, into utter ungodliness and criminality, -- except, indeed, in so far as they were drawn out by the rapidly increasing dissenters, or by the evangelical minority within the Established Church. The collisions of the century took various forms. After the Union with England, dancing assemblies, theatres, and wandering players (with Allan Ramsay to patronize them), dancing on the tight-rope, cock-fighting, gambling, and horse-racing make their appearance, and receive considerable countenance and patronage from various classes, upper and lower; while {19} ineffectual attempts are made to put them down by civil penalties inflicted by burgher magistrates, and by public ecclesiastical censures, which the zealous clergy rigidly enforce, but which the new-light clergy are anxious to relax. In the turmoil of opinions which sprang up in this new state of things, there are rumors of deism, and even of atheism, being secretly entertained or openly avowed, and of the establishment here and there, in town and country, of " hell-fire clubs," where bold men met to discuss new opinions, and even, it is said, to act mock ceremonies, intended to ridicule the sacraments, and all that is awful in religion. Worse than all, and without being Much noticed, or meeting with much opposition on the part of the clergy of either party, there is the commencement of those drinking customs, which have ever since exercised so prejudicial an influence on the Scottish character.

If we look to the common people in the first quarter of the century, we find them in a state of great rudeness in respect of the comforts and elegancies of life. In the Highlands, they are scarcely removed above the lowest state of barbarism; and in the borders between the Highlands and Lowlands, the Celts are lifting cattle and exacting black-mail from the Lowlanders. Even in the more favored districts in the south of Scotland, the ground is unfenced; roads are very rare; and goods are carried on the backs of horses. The clothing of the people in the same region is of undyed black and white plaiding, and neither men nor women have shoes or stockings. Their ordinary food is oatmeal, pease, or beer, with kail groats and milk, and they rarely partake of flesh meat. The houses have only the bare ground as floors, with a fireplace in the midst, and the smoke escaping out of a hole in the roof, and with seats and the very beds of turf; even

in the dwellings of the farmers there are seldom more than two apartments; not unfrequently, however, in the south-west of Scotland, there is in addition a closet, to which the head of the house would retire at set times for devotion. Superstitious beliefs are still entertained in all ranks of life, and are only beginning to disappear among the educated classes. In the Highlands and Islands, second-sight is as firmly believed by the chieftain as by the clansmen. In the Lowlands, mysterious diseases, arising from a deranged nervous {20} system, are ascribed to demoniacal possessions; and witches, supposed to have sold themselves to the Evil One, and accomplishing his purposes in inflicting direful evils on the persons and properties of neighbors, are being punished by the magistrates, who are always incited on by the people, and often by the more zealous ministers of religion. Toleration is not understood or acknowledged by any of the great parties, political or religious.

What, it may be asked, is there in the condition of this people fitted to raise any hope that they are ever to occupy a high place among the nations of the earth? I am sure that a worldly-minded traveller, or an admirer of mere refinement and art, in visiting the country at those times, and comparing it with France or Italy, would have discovered nothing in it to lead him to think that it was to have a glorious future before it. But a deeper and more spiritually-minded observer might have discovered already the seeds of its coming intelligence and love of freedom: -- in the schools and colleges planted throughout the land in the love of education instilled into the minds of the people and, above all, in their acquaintance with the Bible, and in their determined adherence to what they believed to be the truth of God.[4]

Before the first age of the century has passed, there are unmistakable signs of industrial and intellectual activity. The Union has connected the upper classes with the metropolis and the Court of England, from which they are receiving a new refinement and some mental stimulus. The middle classes, and even the lower orders, are obtaining instruction from a very different quarter, from their parochial schools and churches, {21} from their burgh academies and their universities. The towns are hastening to take advantage of the new channels of trade and commerce; manufactures are springing up in various places, and already there is a considerable trading intercourse between the west of Scotland and America. The proprietors of the soil, in need of money to support their English life and to buy luxuries, are beginning to subdivide and enclose their lands, and to grant better dwellings and leases to their tenantry, who, being thereby placed in circumstances fitted to encourage and reward industry, are prepared to reclaim waste lands, to manure their grounds, to improve their stock of sheep and cattle, and introduce improved agricultural implements.

This imperfect sketch may help the reader to comprehend the circumstances in which the Scottish philosophy sprang up and grew to maturity, and the part which its expounders acted in the national history. It could have appeared only in a time of peace and temporal prosperity, but there had

been a preparation for it in the prior struggles. The stream which had risen in a higher region, and long pursued its course in ruggedness, -- like the rivers of the country, -- is now flowing through more level ground, and raising up plenty on its banks. It is a collegiate, and therefore a somewhat isolated, element among the agencies which were forming the national character and directing the national destiny; but it had its sphere. Through the students at the universities, it fostered a taste for literature and art; it promoted a spirit of toleration, and softened the national asperities in religious and other discussions; it is identified with the liberalism of Scotland, and through Adam Smith, D. Stewart, Mackintosh, Horner, Brougham, Jeffrey, Sydney Smith, Lord John Russell, and Palmerston, with the liberalism of the three kingdoms; and, above all, it has trained the educated portion of the inhabitants of North Britain to habits of reflection and of independent thought. The Scottish metaphysicians, with the exception of Chalmers, have never identified themselves very deeply with the more earnest spiritual life of the country; but they defended the fundamental truths of natural religion, and they ever spoke respectfully of the Bible. The Scottish philosophy, so far as it is a co-ordination of the facts of consciousness, never can be antagonistic to a true theology; I believe indeed it may help to establish some {22} of the vital truths of religion, by means, for instance, of the moral faculty, the existence of which has been so resolutely maintained by the Scottish school. Some of the moderate clergy did at times preach the Scottish moral philosophy instead of scriptural truth; but they did so in opposition to the counsel of the metaphysicians, at least of Hutcheson, who recommended his students to avoid the discussion of philosophic topics in the pulpit. Some of those who have been the most influential expounders of the Scottish theology, such as Chalmers and Welsh, have also been supporters of the Scottish philosophy, and have drawn from its established doctrines arguments in favor of evangelical religion.

III. -- PRECURSORS OF THE SCHOOL.

I/N\ the Libraries of some of the Scotch Colleges are collected a number of the theses which had been defended in the Scottish Universities in the seventeenth century. These seem to fall under the heads of Theses Logicae, Theses Ethicae, Theses Physicae, Theses Sphericae. Aristotle still rules both in logic and ethics. In logic, there is much abstract enunciation, and there are many acute distinctions in regard to Ens and unity, singulars and universals; and in ethics, the discussions are about virtue and vice, and choice. In physics, there are rational and deductive investigations of the nature of motion and resistance. During the century, the courses of study differ somewhat in the different universities, but still there is a general correspondence. In the course of Philosophy the Regents use Aristotle <De Anima>, Porphyry's Introduction, the Categories of Aristotle, the Dialectics of Ramus, and the Rhetoric of Vossius, with the works of such writers as Crassotus, Reas, Burgersdicius, Ariaga, Oviedo, &c. The ethics include politics and economics, and there are discussions about the nature of habits. It is scarcely necessary to say that all topics are treated in a logical

and rational, and not in an observational, manner and spirit.

The Parliamentary Commission for visiting the universities, appointed in 1690, and following years, directed, in 1695, the {23} professors of philosophy in St. Andrews to prepare the heads of a system of logic, and the corresponding professors in Edinburgh to prepare a course of metaphysics. The compends drawn up in consequence were passed from one college to another for revision there is no evidence that they were finally sanctioned, but they may be accepted as giving a fair idea of the instructions in philosophy conveyed in the universities of Scotland at the close of the eighteenth century, -- at the very time when Locke's Essay was finding its way so rapidly over the three kingdoms.[5] Logic is called the instrument to acquire other sciences, inasmuch as it prescribes rules for rightly apprehending, judging, and arguing. It is said to be defined by others as the science which directs the operations of the mind for finding out truth in every other science. It is represented as treating of the three operations of apprehension, judgment, and discourse, to which some add a fourth part, on method, under which analysis and synthesis are explained. In all this there is nothing but the commonplace of by-gone ages. But in this same text-book of logic we have the distinction drawn in the Port Royal Logic, between the extension and comprehension of the notion, adopted and stated. "We must distinguish betwixt the extension and comprehension of an idea. All the essential attributes of an idea are called its comprehension, as being, substance, vegetative, sensitive, and rational are the comprehension of man; but Peter, Paul, &c., contained under man, are called the extent of man." It can be shown that this distinction comes down in an unbroken historical chain in Glasgow to Sir W. Hamilton, who has so profitably amplified and applied it. It is found in the Introduction to Logic by Carmichael, and in the Logical Compend of Hutcheson; and the latter continued to be used in Glasgow till towards the time when Hamilton was a student there. Metaphysics are said to be defined by some, as a science of being as being; by others as a speculative science, which considers being in general, and its properties and kinds, as abstracted from matter. The benefits arising from the study of metaphysics are said to be, that treating of undoubted truths and axioms, we are enabled by their assistance the better to discover truths generally, and avoid errors; that as dividing {24} beings into classes it keeps us from confusion; that giving general names to common and abstracted beings, it aids the understanding in every kind of learning, and specially in theology, in which use is made of metaphysical terms. The first part of metaphysics treats of the principles of being, and of the various species of beings. The second part treats of the properties of being, such as unity, verity, goodness; and under this head we have abstract discussions as to the finite and infinite, the necessary and contingent, the absolute and relative, cause and effect, means and end, substance and quality. Such was the pabulum on which college youths fed during the century. This was the learning which helped to sharpen the intellects of such men as Henderson, Rutherford, Leighton, Gillespie, Baillie, Dickson, Burnet (Bishop), Stair (Lord), and

Carstairs, who acted so important a part in the affairs of their country.

But in order to appreciate fully the philosophic tastes and capacities of Scotchmen, we must follow them into France. From a very old date, certainly from the thirteenth century, there had been a close connection between that country and Scotland, arising from the jealousy entertained by both nations of the power and ambition of England. The Scottish youth who had a love of adventure, or a thirst for military glory, had a splendid opening provided for them in the Scottish Guard, which protected the person of the king of France, while those who had a taste for letters found means of instruction and employment in the numerous French colleges.[6] The Scotch scholars who returned to their own land brought back the French learning with them. Bishop Elphinston, who was the founder, and Hector Boece, who was the first principal of King's College, Aberdeen, had both taught in the University of Paris; and they set up the Scottish University on the model of the French one. John Major or Mair, who taught scholastic theology in Glasgow and St. Andrews, and who was the preceptor of Knox and Buchanan, had been for some time in the University of Paris. During the sixteenth, and the early part of the seventeenth century, there was a perpetual stream of Scottish scholars flowing into France. Some of these were Catholics, {25} to whom toleration was denied at home, and who betook themselves to a country where they had scope for the free exercise of their gifts. But quite as many were Protestants, who finding (as Scotchmen in later ages have done) their own land too narrow, or thirsting for farther knowledge or learned employment, connected themselves with one or other of the reformed colleges of Saumur, Montauban, Sedan, Montpellier, and Nismes, where some of them remained all their lives, while others returned to their own country. Some of these emigrants were lawyers or physicians; but by far the greater number of them were devoted to literature, philosophy, or theology. George Buchanan, Thomas Ricalton, three Blackwoods, Thomas Dempster, two Barclays, Andrew Melville, John Cameron, Walter Donaldson, and William Chalmers are only a few of the Scotchmen who occupied important offices in France. Two deserve to be specially named, as they wrote able logical works, -- the one, Robert Balfour, a Catholic, and Principal of Guienne College, Bourdeaux, and an erudite commentator on Aristotle; and the other, Mark Duncan, a Protestant, and Principal of the University of Saumur, and author of Institutes of Logic. There must have been some reality as the ground of the extravagant statement of Sir Thomas Urquhart in his "Discovery of a Most Exquisite jewel," that "the most of the Scottish nation, never having restricted themselves so much to the propriety of words as to the knowledge of things, where there was one preceptor of languages among them, there was above forty professors of philosophy." "The French conceived the Scots to have above all nations in matter of their subtlety in philosophical disputations, that there have not been till of late for these several years together any lord, gentleman, or other in all that country, who, being desirous to have his son instructed in the principles of philosophy, would entrust him to the discipline of any other than a Scottish master." He adds, that "if a Frenchman

entered into competition, a Scotchman would be preferred."

By such teaching at home, and by such foreign intercourse, a considerable amount of narrow but intense intellectual life was produced and fostered in Scotland. But youths were beginning to feel that the air was too close, too confined, and too monastic for them, and were longing for greater freedom and {26} expansion. While Aristotle and the scholastic method still hold their place in the cloisters of the colleges, there is a more bracing atmosphere in the regions without and beyond; and this is now to rush into Scotland. From the time of the revival of letters in the sixteenth century, almost every great and original thinker had thought it necessary to protest against the authority of Aristotle and the schoolmen. Bacon left Cambridge with a thorough contempt for the scholastic studies pursued there; and the grand end aimed at in his "Novum Organum," was to carry away men's regards from words and notions, to which they had paid too exclusive attention, and to fix them on things. In respect of a disposition to rebel against Aristotle and the schoolmen, Descartes was of the same spirit as Bacon; and Gassendi and Hobbes agreed with Descartes, with whom they differed in almost every thing else. It would be easy to produce a succession of strong testimonies against the Stagyrite and the Mediaevals, spread over the whole of the seventeenth century. The rising sentiment is graphically expressed by Glanvil in his "Scepsis Scientifica," published in 1665. He declares that the " ingenious world is grown quite weary of qualities and forms-," he declaims against "dry spinosities, lean notions, endless altercations about things of nothing; " and he recommends a " knowledge of nature, without which our hypotheses are but dreams and romances, and our science mere conjecture and opinion; for, while we have schemes of things without consulting the phenomena, we do but build in the air, and describe an imaginary world of our own making, that is but little akin to the real one that God made."

The realistic reaction took two different but not totally divergent directions in the seventeenth century, and both the streams reached Scotland in the following century. In the works of Grotius and Puffendorf, an elaborate attempt was made to determine the laws of nature in regard to man's political and social conditions, and apply the same to the examination and rectification of national and international laws. This was thought by many to be a more profitable and promising theme than the perpetual discussion of the nature of being and universals. This school had undoubtedly its influence in Scotland, where Carmichael, in 1718, edited and annotated Puffendorf, {27} and where Hutcheson, and Hume, and A. Smith, and Ferguson, and D. Stewart, combined juridical and political with moral inquiries, and became the most influential writers of the century on all questions of what has since been called social science.

But a stronger and deeper current was setting in about the same time,-a determination to have the experimental mode of investigation applied to every department of knowledge. This method had already been applied to physical science with brilliant results. And now there was a strong desire felt to have the new manner adopted in the investigation of

the human mind. In 1670, John Locke and five or six friends are conversing in his chamber in Oxford on a knotty topic, and quickly they find themselves at a stand; and it occurred to Locke that, before entering " on inquiries of that nature, it was necessary to examine our own abilities, and see what objects our understandings were or were not fitted to deal with." He pondered and wrote on this subject for twenty years, at the close of which (in 1690) he published his immortal " Essay on the Human Understanding." In this work he would banish for ever those innate ideas which had offered such obstacles to the progress of thought; and, by an inquiry into the actual operations of the human mind, he would trace the ways in which mankind attain ideas and knowledge, and settle the bounds imposed on the human understanding. Locke's Essay was hailed with acclamation by all who were wearied of the old scholastic abstractions and distinctions, and who had caught the new spirit that was abroad.

Still Locke's Essay was not allowed to take possession of the thinking minds of the country without a vigorous opposition. Locke was met in his own day by Stillingfleet, the Bishop of Worcester, who argued resolutely that the view given in the Essay of our idea of substance was not sufficiently deep to enable it to bear up the great truths of religion, especially the doctrine of the Trinity. The great Leibnitz severely blamed Locke for overlooking necessary truth, and reviewed his work, 'book by book and chapter by chapter, in his "Nouveaux Essais sur l'Entendement Humain; " which, however, in consequence of Locke's death taking place in the mean time, was not published for many years after. It was felt by many otherwise {28} favorable to the new spirit, that Locke had not laid a sufficiently deep foundation for morality in his account of our idea of virtue, which he derived from mere sensations of pleasure and pain, with the law of God superadded in utter inconsistency with his theory. There were still in England adherents of the great English moralists, More and Cudworth, who had opposed Hobbes with learning and ability; and these maintained that there was need of deeper principles than those laid down by Locke to oppose the all-devouring pantheistic fatalism of Spinoza on the one hand, and the rising materialistic spirit on the other.

In the early part of the eighteenth century, there appeared several works which were not conceived at least wholly in the spirit of Locke. I do not refer to such works as Norris's "Ideal World," in which we have an able defence of the Aristotelian analysis of reasoning, and an exposition of Platonism, more ideal far than that presented in Plato's own dialectic; nor to Collier's "Clavis," "being a demonstration of the non-existence or impossibility of an external world:" I allude to works which left a far deeper impression on their age. Samuel Clarke, with vast erudition and great logical power, was establishing, in a mathematical manner, the existence and attributes of God, giving virtue a place among the eternal relations of things perceived by reason, and defending the doctrine of human freedom and responsibility against those who were reducing men to the condition of brutes or machines. Berkeley did adopt the

theory of Locke as to the mind being percipient only of ideas, but the view which he took of human knowledge was very different; for while Locke, consistently or inconsistently, was a sober realist, Berkeley labored to show that there was no substantial reality except spirit, and thought in this way to arrest the swelling tide of materialism and scepticism. A more accurate thinker than either, Bishop Butler, was establishing the supremacy of conscience, and showing that there was a moral government in the world; and that revealed religion was suited to the constitution of the mind, and to the position in which man is placed.

It was while philosophic thought was in this state that the Scottish Philosophy sprang up. The Scottish metaphysicians largely imbibed the spirit of Locke; all of them speak of him {29} with profound respect; and they never differ from him without expressing a regret or offering an apology. Still the Scottish school never adopted the full theory of Locke; on the contrary, they opposed it in some of its most essential points; and this while they never gave in to the mathematical method of Clarke, and while they opposed the ingenuities of Berkeley. Hutcheson, the founder of the Scottish school, was a rather earlier author than Butler, to whom therefore he was not indebted for the peculiarities of his method and system. But there was a writer to whom both Butler and Hutcheson, and the early Scottish school generally, were under deeper obligation than to any other author, or all other authors, and who deserves in consequence a more special notice.

IV. -- SHAFTESBURY.

T/HE\ author who exercised the most influence on the earlier philosophic school of Scotland was not Locke, but Lord Shaftesbury (born 1671, died 1713), the grandson of the Lord Chancellor Shaftesbury, who bad been the friend of Locke. " Peace," says he, " be with the soul of that charitable and courteous author, who, for the common benefit of his fellow-authors, introduced the way of miscellaneous writing." He follows this miscellaneous method. The pieces which were afterwards combined in his " Characteristics of Men, Manners, and Times," were written at various times, from I 707 to 1712. They consist of a " Letter Concerning Enthusiasm," " Sensus Communis, an Essay on the Freedom of Wit and Humor," " Soliloquy, or, Advice to an Author," "An Inquiry Concerning Virtue and Merit," "The Moralists, a Philosophical Rhapsody," "Miscellaneous Reflections on the said Treatises, and other Critical Subjects," "A Notion of the Historical Draught or Tablature of the judgment of Hercules, with a Letter concerning Design." He tells us that the miscellaneous manner was in the highest esteem in his day, that the old plan of subdividing into firsts and seconds had grown out of fashion, and that the " elegant court divine exhorts in miscellany, and is ashamed to bring his {30} twos and threes before a fashionable assembly." " Ragouts and fricassees are the reigning dishes; so authors, in order to become fashionable, have run into the more savory way of learned ragout and medley." His style is evidently after the French, and not the old English, model. It has the jaunty air of one who affects to be a man of

elegance and fashion. Undoubtedly he was extensively read in the Greek and Roman philosophy, especially in Plato, Aristotle, Cicero, and the Roman Stoics, and he has many just and profound views, but these are ever made to appear as the ornaments of a modern nobleman, who studies philosophy as an accomplishment.

His " Characteristics" open with remarks on " Enthusiasm," and on " Wit and Humor." He tells us that "vapors naturally rise," and he would dispel them by ridicule. " The melancholy way of treating religion is that which, according to my apprehension, renders it so tragical, and is the occasion of its acting in reality such dismal tragedies in the world." He would " recommend wisdom and virtue in the way of pleasantry and mirth," and tells us that " good-humor is not only the best security against enthusiasm, but the best foundation of piety and true religion." It does not appear very clearly what is the nature of the piety and religion which he would recommend. Sometimes he seems to scoff at the Scriptures, and at all their spiritual verities and holy mysteries; at other times he would make it appear as if he wished to be thought a believer in Christianity. There is, I suspect, much of latent levity in the profession he makes: " We may in a proper sense be said faithfully and dutifully to embrace those holy mysteries even in their minutest particulars, and without the least exception on account of their amazing depth," " being," he adds, " fully assured of our own steady orthodoxy, resignation, and entire submission to the truly Christian and catholic doctrines of our holy church, as by law established."

But he reckons these pleasantries merely as an introduction to graver subjects. He has largely caught the spirit of Locke, but he by no means follows him, especially in his rejection of innate ideas. "No one," says he, "has done more than Locke towards recalling of true philosophy from barbarity into the use and practice of the world, and into the company of the better and politer sort, who might well be ashamed of it in its {31} other dress. No one has opened a better and clearer way to reason." But he qualifies his praise. "'Twas Mr. Locke that struck at all fundamentals, threw all order and virtue Out Of the world, and made the ideas of these, which are the same with those of God, unnatural, and without foundation in our minds. <Innate> is a word he poorly plays upon: the right word, though less used, is <connatural>." He shows that there are many of our mental qualities natural to us. " Life, and the sensations which accompany life, come when they will, are from mere nature and nothing else. Therefore, if you dislike the word innate, let us change it, if you will, for instinct, and call instinct that which nature teaches, exclusive of art, culture, or discipline." Beginning with these lower affections, he goes on to show that preconceptions of a higher kind have place in human kind, preconceptions' of the 'fair and beautiful.'"[7]

He reviews the famous argument of Descartes, " We think, therefore we are." "Nothing more certain: for the Ego or I being established in the first part of the proposition, the Ergo, no doubt, must hold it good in the latter." "For

my own part," he adds, "I take my being upon trust" He everywhere appeals to the "Sensus Communis," or Common Sense. His general doctrine is thus expressed: "Some moral and philosophical truths there are withal so evident in themselves, that it would be easier to imagine half mankind to have run mad, and joined precisely in one and the same species of folly, than to admit any thing as truth which should be advanced against such <natural knowledge, fundamental reason, and common sense>."[8] He allows that what is natural to us may require labor and pains to bring it out. " Whatever materials or principles of this kind we may possibly bring with us, whatever good faculties, senses, or anticipating sensations and imaginations may be of nature's growth, and arise properly of themselves without our art, promotion, or assistance, the general <idea> which is formed of all this management, and the clear notion we attain of what is preferable and principal in all these subjects of choice and estimation, will not, as I imagine, by any person be taken for {32} <innate>. Use, practice, and culture must precede the under standing and wit of such an advanced size and growth as this." These surely are the very views which were developed more fully and articulately by Reid, in his opposition to the scepticism of Hume. The object of his works is to carry out these principles to taste and morals. "Nor do I ask more when I undertake to prove the reality of virtue and morals. If I be certain that I am, it is certain and demonstrable who and what I should be." Should one who had the countenance of a gentleman ask me why I would avoid being nasty when nobody was present?' in the first place, I should be fully satisfied that he himself was a very nasty gentleman who could ask this question, and that it would be a hard matter for me to make him ever conceive what true cleanliness was. However, I might, notwithstanding this, be contented to give him a slight answer, and say, I It was because I had a nose.' Should he trouble me further, and ask again, 'What if I had a cold? or what if naturally I had no such nice smell?' I might answer perhaps, 'That I cared as little to see myself nasty as that others should see me in that condition.' I But what if it were in the dark?' 'Why, even then, though I had neither nose nor eyes, my <sense> of the matter would still be the same: my nature would rise at the thought of what was sordid."' He thus reaches a sense of beauty. "Much in the same manner have I heard it asked, 'Why should a man be honest in the dark?"' The answer to this question brings him to a moral sense.

He speaks of nature in general, and human nature in particular, as an " economy," and as having a "constitution" and a "frame." In examining the nature of the soul, he finds (1) self-affections, which lead only to " the good of the private." He enumerates, as belonging to this class, ,love of life, resentment of injury, pleasure, or appetite towards nourishment and the means of generation; interest, or the desire of those conveniences by which we are well provided for or maintained; emulation, or love of praise and honor; indolence, or love of ease and rest." But he finds also (2) natural affections, which lead to the good of the public. He takes great pains to establish the existence of disinterested affections, and opposes the views of those who, like Rochefoucauld, would resolve all human action {33}

into a refined selfishness. Referring to the common saying, that interest governs the world, he remarks shrewdly: " Whoever looks narrowly into the affairs of it, will find that passion, humor, caprice, zeal, faction, and a thousand other springs which are counter to self-interest, have as considerable a part in the movements of this machine. There are more wheels and counterpoises in this engine than are easily imagined." With such affections, " man is naturally social, and society is natural to him;" and in illustrating this position, he sets himself vigorously against the social theory of Hobbes, who represents the original state of man as one of war. Virtue consists in the proper exercise of these two classes of affections. Vice arises when the public affections are weak and deficient, when the private affections are too strong, or affections spring up which do not tend to the support of the public or private system. He shows that virtue, as consisting in these affections, is natural to man, and that he who practises it is obeying the ancient Stoic maxim, and living according to nature. The virtues which he recommends fall far beneath the stern standard of the Stoics, and leave out all the peculiar graces of Christianity: they consist of, -- "a mind subordinate to reason, a temper humanized and fitted to all natural affection, an exercise of friendship uninterrupted, thorough candor, benignity, and good-nature, with constant security, tranquillity, equanimity."

He would establish a morality on grounds independent of religion. "Whoever thinks that there is a God, and pretends formally to believe that he is just and good, must suppose that there is, independently, such a thing as justice, truth, and falsehood, right and wrong, according to which he pronounces that God is just, righteous, and true." " If virtue be not really estimable in itself, I can see nothing estimable in following it for the sake of a bargain; " and he complains of those who " speak so much of the rewards and punishments, and so little of the worth or value of the thing itself." He remarks very justly: " By building a future state on the ruins of virtue, religion in general, and the cause of a deity, is betrayed; and by making rewards and punishments the principal motives to duty, the Christian religion in particular is overthrown, and its greatest principle, that of love, rejected and exposed." He admits, how {34} ever, that a good God, as a model, has an effect on our views of morals and conduct; and allows that "fear of future punishment and hope of future reward, how mercenary and servile however it may be accounted, is yet, in many circumstances, a great advantage, security, and support to virtue."

Such is his view of the nature of virtue. But Shaftesbury is quite aware that the question of the character of the virtuous act is not the same as that of the mental faculty which looks at it and appreciates it. This faculty he represents as being of the nature of a sense. Locke had allowed the existence of two senses, an external and an internal; and had labored in vain to derive all men's ideas from these two sources. Hutcheson, perceiving that the inlets to the mind were too few according to the theory of Locke, calls in other senses. These senses become very numerous in the systems of some of the Scottish

metaphysicians, such as Gerard. In the writings of Shaftesbury, two occupy an important place, -- the sense of beauty and the moral sense.

"No sooner," he says, "does the eye open upon figures, the ear to sounds, than straight the Beautiful results, and grace and harmony are known and acknowledged. No sooner are actions viewed, no sooner the human affections and passions discerned (and they are most of them as soon discerned as felt), than straight an <inward> eye distinguishes and sees the <fair> and <shapely>, the <amiable> and <admirable>, apart from the <deformed>, the <foul>, the <odious>, or the <despicable>." Though in all this advancing quite beyond the "Essay on the Human Understanding," yet he seems to be anxious to connect his view of the moral sense with the reflection or inward sense of Locke. "In a creature capable of forming general notions of things, not only the outward beings which offer themselves to the sense are the objects of the affections, but the very actions themselves, and the affections of pity, kindness, gratitude, and their contraries, being brought into the mind by reflection, become objects. So that by means of this reflected sense, there arises another kind of affection towards these very affections themselves, which have been already felt, and are now become the subject of a new liking or dislike." Conscience is represented by him "as the reflection in the mind of any unjust action or behavior, which he knows to be naturally odious and ill-deserving. {35} No creature can maliciously and intentionally do ill, without being sensible, at the same time, that he deserves ill. And in this respect, every sensible creature may be said to have a conscience."[9]

He has evidently been smitten with some of the Platonic views of beauty. "We have," he says, "a sense of order and proportion; and having, a sensation, reason can give this account of it, that whatever things have order, the same have unity of design and concur in one, are parts constituent of one whole, or are in themselves one system. Such is a tree with all its branches, an animal with all its members, an edifice with all exterior and interior ornaments." He is fond of connecting or identifying the beautiful and the good; in fact, virtue is represented by him as a higher kind of beauty. "It is, I must own, on certain relations or respective proportions, that all natural affection does in some measure depend." "The same numbers, harmony, and proportions have a place in morals." He evidently clings fondly to the idea that " beauty and good are one and the same."

We have given so full an account of the philosophy of Shaftesbury, because of the influence which it exercised on the Scottish Philosophy. Francis Hutcheson did little more than expound these views, with less versatility, but in a more equable, thorough, and systematic manner. Turnbull, who founded the Aberdeen branch of the school, and influenced greatly the mind of Reid, avowedly drew largely from Hutcheson in his theories of taste and virtue. Reid and Beattie got their favorite phrase, " common sense," I have no doubt, directly or indirectly from the treatise so entitled in the " Characteristics." Hume was evidently well

acquainted with the writings of {36} Shaftesbury; and I am inclined to think that they may have helped to form his style, and to suggest some of his essays. We have an anticipation of the spirit of Hume in the miscellany entitled, " Philocles to Palemon:" "You know that in this Academic Philosophy I am to present you with, there is a certain way of questioning and doubting, which in no way suits the genius of our age. Men love to take party instantly. They can't bear being kept in suspense. The examination torments them." Theocles observes, that "if there be so much disorder in the present state of things, he would not be disposed to think better of the future." Lord Monboddo declares that " Shaftesbury's Inquiry is the best book in English on the subject of morals." His Draught or Tablature of the judgment of Hercules, and his Disquisitions on Taste, originated the theories of Beauty which formed an essential part of Scottish metaphysics for more than a century.

V. -- GERSHOM CARMICHAEL.

S/IR\ W/ILLIAM\ H/AMILTON\ says that Gershom Carmichael "may be regarded, on good grounds, as the real founder of the Scottish school of philosophy." ("Reid's Works," P. 30.) I am disposed to retain the honor for Francis Hutcheson, to whom it is usually ascribed. Carmichael does not possess the full characteristics of the school. He seems to me to be the bond which connects the old philosophy with the new in Scotland.

He was descended from a genuine covenanting stock. His father was Alexander Carmichael, the son of Frederick Carmichael, who had been minister in various places in Fifeshire, and who died in 1667; his mother was relict (she had been the second wife) of Fraser of Bray. Alexander was minister at Pittenain, and had at one time been attached to prelacy, but abandoned it to join the suffering ministers. Early in 1672, he is in the tolbooth of Edinburgh. On February 22, he is before the Council, charged with keeping conventicles, and is ordered to depart the kingdom, never to return without license; and February 26, he is transported in a ship to London, where {37} he was useful as a minister, and died about the year 1676 or 1677. In 1677, shortly after his death, there was published, from the copy which he had left, a treatise, entitled, "The Believer's Mortification of Sin by the Spirit," edited by Thomas Lye, who says in the preface, "As for that flesh of his flesh, and the fruit of his loins, as for that Ruth and Gershom he hath left behind him, I question not but as long as the saints among you continue to bear your old name, Philadelphia (so the old Puritans of England have used to style you), you will not, you cannot, forget to show kindness to Mephibosheth for Jonathan's sake." Gershom, so called by his father because he was "a stranger in a strange land," seems to have been born in London about 1672. It may be supposed that the family returned to Scotland after the father's death. We certainly find Gershom enrolled a Master of Arts in the University of Edinburgh, July 31, 1691. He afterwards became Regent at St. Andrews, where he took the oath of allegiance,

and subscribed the Assurance. On November 22, 1694, he is elected and admitted Master in the University of Glasgow, having been brought in by public dispute, that is, by disputation on comparative trial, through the influence of Lord Carmichael, afterwards the first Earl of Hyndford. About the same time he lost his mother, and "married a good woman, the daughter of Mr. John Inglis." Wodrow, who tells us this (" Letters "), was his pupil, and describes him as at that time possessed of little reading, as dictating several sheets of peripatetic physics <de materia prima>, as teaching Rohault, and being very much a Cartesian, -- this seven years after the publication of Newton's " Principia." Afterwards he made himself master of the mathematics and the new philosophy, and Wodrow used to jest with him on this matter of his juvenile teaching. From these notices it appears that, by parentage and birth and training and ancestral prepossessions, he belongs to the seventeenth, but catches the spirit of the eighteenth century. He exhibits in his own personal history the transition from the old to the new thought of Scotland.

He is represented as a hard student, a thinking, poring man, his favorite study being moral philosophy. At the commencement of his professorial life, a Master took up the batch of students as they entered on the study of philosophy, and carried {38} them in successive years through all the branches, including logic, pneumatology, moral philosophy, and natural philosophy. This system required the teacher to be a well-informed man in various departments, but was a hindrance to eminence in any one branch of learning. But from 1727 the Masters are restricted to their several classes, and to Carmichael is consigned moral philosophy. It appears that, in 1726, there were thirty-six students in the third year's class, and nineteen in that of the fourth year; in the latter days of Carmichael the numbers were larger. The classes were swelled by non-conforming students from England, who, shut out from the English universities by their tests and their churchified influence, betook themselves to the Scottish colleges. Many of these were attracted to Glasgow by the fame of Carmichael. The college session lasted from the beginning of November to the end of May. On the Lord's day, the Masters met with their classes, to take an account of the sermons, and this was a work in which Carmichael felt a special interest.

Carmichael was a most affectionate, friendly man, but withal a little warm in his temper, and became involved in consequence in scenes which seem somewhat inconsistent with the supposed calm of an academic life. The college corporation was evidently much agitated by internal feuds, and Carmichael takes his part in them, commonly siding with the party of independence against the Principal. In 1704, joined by Mr. Loudon, he protests that several things minuted as Acts of Faculty were written and signed privately by the Principal. The Faculty finds the charge unfounded, and suspends the two from their functions. Subsequently they ask forgiveness, and are restored. In 1705, Mr. Law, one of the Regents, complains that some expressions had been uttered against him by Mr. Carmichael, who is gravely admonished, and exhorted to avoid every thing irritating

towards his colleagues in time to come. In 1717, there are hot disputes as to who should elect the Rector. The Masters combine against the Principal, call the students to the common hall, and choose their man. But, in 1718, the Commission for the Visitation of the College finds some of the Masters, including Carmichael, guilty of great disorder in the election of the Rector; and they are discharged for a time from exercising any part of their office (such as choosing professors), {39} except the ordinary discipline in the class. In 1722, a bonfire was kindled by the students on a decision in favor of the election of Lord Molesworth (we shall meet with him again in these articles) to Parliament, and Carmichael rushes into the heart of the mob, and gets into trouble in extinguishing the flames. In November, 1728, we find him joining in a protest against the claim of the Chancellor to sit and vote. It was by such disputes that the constitution of the Scottish colleges came to be settled.

Patriotic exertions helped to relieve the sameness of the college life, and in these the collegiate body in Glasgow (it was different in Aberdeen) are of one mind. In 1708, the kingdom is threatened with "an invasion of French and Irish papists," and the Masters agree each to maintain a number of foot soldiers; and Carmichael signs for five men. In September, 1715, the rising in the north of Scotland in favor of the pretender becomes known. The Faculty agrees to raise fifty men at sixpence a day; the Principal provides eight, the professor of divinity five, and Carmichael subscribes for four. It was by such active exertions in the south of Scotland that the progress of the Rebellion was so speedily arrested.

In his later years, as he became known, Carmichael carried on a correspondence with Barbeyrac and other learned men. He had a numerous family, "who were all a comfort to him, except one, who was a cause of great distress." Wodrow says, that " in his advanced years he was singularly religious. I know he was under great depths of soul exercise, and much the worse that he did not communicate his distress to anybody almost." This is the only record we have of a Scottish metaphysician having had his" soul exercises;" but surely there must have been others who had their conflicts as they dived into the depths of the human soul. For the last two or three years of his life, he had a cancerous wart, which spread over one eye and across his nose to the other eye, and at last carried him off. During all his illness he remained a hard student and serious Christian. He died, November 25, 1729. On his death the English students leave the university, the attendance at which is reported by Wodrow as very thin in December; and it does not seem to improve till Hutcheson commences his lectures in the following October. {40}

Carmichael published "Breviuscula Introductio ad Logicam," which reached a second edition in 1722. He defines logic as the science which shows the method of discovering truth, and of expounding it to others. He represents it as having to do with judgment, but then it also treats of apprehension as necessary to judgment. Under apprehension he speaks of the doctrine of the difference of the comprehension and extension of a notion, and of the former

being evolved by definition, and the latter by division, as being quite commonplace. He distinguishes between immediate and mediate judgment. Immediate is between two ideas immediately compared; mediate, in which the comparison is by means of a third judgment, is called discourse. He says all knowledge may ultimately be resolved into immediate judgments, known in their own light; and he divides immediate judgments into two classes: one abstract, in which there is no direction of the mind to the thing itself as really existing, <e.g.>, the whole is greater than a part; and the other intuitive, when the mind has a consciousness of the thing as present, as, for example, the proposition, <Ego cogitaits existo>. Coming to mediate judgment, he gives as the supreme rule of affirmative syllogism the axiom, "Things which are the same with one and the same third are the same with one another g, " and of negative syllogisms the axiom, " Things of which one is the same with a third, and the other not the same, are not the same with one another." These statements show a " thinking, poring," man, and will be valued most by those who have thought longest on these subjects. We see a new historical step in the transmission of the distinction between the extension and comprehension of a notion; we see that the difference between immediate and mediate judgments was known in these times; and that there was an attempt to find a supreme rule of mediate reasoning in the sameness (here lies the looseness) of two things with a third. Carmichael is aware that there are propositions seen to be true in their own light; and that there is an intuitive apprehension, in which the thing is known as present; and many will think that the <ego cogitaiis existo> is a preferable form to the <cogito ergo sum> of Descartes.

Carmichael published an edition of Puffendorf, " De Officio Hominis et Civis," with Notes and Supplements, for the use of students, described by Hutcheson as more valuable than the {41} original work. In the notes he offers many acute observations, and gives extracts from De Vries, Titius, and Grotius. In the first supplement he speaks of a divine law, to which all morality has reference, which alone obliges, and to which all obligation of human laws is ultimately to be referred. The law may be made known either by means of signs, oral or written, or by the constitution of human nature, and other things which offer themselves to the observation of men. What is known by the latter is called <natural law>, which has two meanings, -- one the faculty of reason itself as given to man by God, and the other such a power of intelligence as can discover what is in nature by ordinary diligence. He takes far higher grounds of religion than those adopted by Shaftesbury and Hutcheson. He declares that no one can be said to obey the law who does not know what the law enjoins, or who acts without reference to God and his law. At the same time, he seems to be a eudaimonist, and inclined to look on God as having an ultimate respect to happiness in his law. He has a second supplement, calm, moderate, and sensible, on the " Duties of Man towards his own Mind," and a third on " Quasi-Contracts."

His latest work, published in 1729, shortly before his death, is " Synopsis Theologiae Naturalis." In his preface

he tells us that, in teaching pneumatology, he had used two Belgian textbooks. He advises that the forms of the Aristotelian school be avoided, as obscure and artificial, but declares at the same time that the doctrines of the scholastics, at least of the older, are more agreeable to reason and holy Scripture than those opposed to them in his day, especially in their finding a foundation for morality and obligation in God; and he denounces some who, of late years, with a showy appearance of genius and eloquence, would separate morality from religion, referring, I should suppose, to the school of Shaftesbury, against which, therefore, he thus gives his dying testimony, as it were in the name of. the old philosophy.

In establishing the existence and perfections of God, he draws arguments from a variety of sources. He would call in metaphysical principles. Thus he urges that there must be <ens aliquod independens>, otherwise we are landed in an infinite series of causes, which he declares (with Aristotle) self-evidently impossible. He appeals, with the French theologian Abbadie, {42} to universal consent. But he reckons the arguments of Descartes and De Vries, and that by Samuel Clarke, as unsatisfactory. He maintains that we can argue that what we attribute to a thing in idea exists, only after we have shown that the thing exists. He maintains that the existence of God as an existing being is to be established, not <a priori>, but <a posteriori>, and appeals to the traces of order, beauty, and design in the universe, and to the illustrations to be found in the writings of Ray, Pelling, Cheyne, Derham, Niewentite, and in Pitcairn on the Circulation of the Blood. He refers to the properties of matter, as established by Newton; and argues, as Baxter did so resolutely afterwards, that matter cannot move of itself, but needs a new force impressed on it. In regard to the dependence of creature on created power, he holds that things spiritual and corporeal exist so long as they have being from the creative efficacy of God, and speaks of the need of a divine <precursus> or <concursus>. He admits, however, that created spirits have efficacy in themselves. He refers to Leibnitz, and shows that he was well acquainted with his theory of possible worlds. It is surely interesting to observe a modest and retiring Scottish writer so thoroughly acquainted with the highest philosophy of his time, British and Continental, and yet retaining his own independence in the midst of his learning. If he cannot be regarded as the founder of the new school, he has the credit of judiciously combining some of the best properties of the old and new philosophy.

VI. -- ANDREW BAXTER

B/AXTER\ cannot be justly described as a leader or a follower of the Scottish school. His method is not really nor professedly that of inductive observation. He belongs rather to the school of Samuel Clarke, to whom he often refers, and always with admiration. But be was a Scotchman, and an independent thinker: he does not belong to the old philosophy; but he was a contemporary of the men who founded the Scottish school, and treated of many of the same topics. He had readers both in England and Scotland in his own day, and for some years after his death; and he deserves a

passing notice as the representative of a style of thought which met with considerable favor in his time, but had to give way before the new school. {43}

We have a life of him in Kippis's " Biographia Britannica," drawn up from materials supplied by his son. He was the son of a merchant in Old Aberdeen, where he was born in 1686 or 1687. His mother was Elizabeth Frazer, descended from a considerable family in the north. He was educated at King's College, Aberdeen, where, at the beginning of last century, he would be trained in the old logic and metaphysics. But, as we shall see more fully in future articles, a considerable amount of a fresh literary taste, and of a spirit of philosophical inquiry, began to spring up in Aberdeen in connection with the two Universities pretty early in that century. Baxter, besides being a good mathematician, was well acquainted with the discoveries of Sir Isaac Newton, and with the theories of Leibnitz as to matter and motion. He was familiar with the Essay on the Human Understanding, but had a deeper appreciation of the speculations of Clarke.

The chief professional employment of his life was that of tutor to young men of good family. The boys who, in our days, would be sent to the great public schools of England taught by Oxford or Cambridge masters, were very often, in the seventeenth and eighteenth centuries, put under tutors, who went about with them to the colleges at home, or travelled with them abroad. The occupation of teaching and travelling tutor was one coveted by young men of limited means and of a reading taste, who did not wish officially to enter the church, and had no other office open to them than that referred to, fitted to furnish them with means of study. When the tutor had trained and travelled with the heir of a good estate, the family felt bound to make provision for him for life. It was thus that, in the seventeenth century, Hobbes had been tutor to two successive Earls of Devonshire; that, in the eighteenth century, Thomson the poet became tutor to the Lord Chancellor Talbot's son on the Grand Tour; that Hume coveted the office of travelling tutor to Murray of Broughton; and Turnbull and A. Smith gave up chairs in the Scottish colleges to become tutors, -- the one to the Wauchopes of Niddrie (?) and the other to the Duke of Buccleuch Baxter was tutor, among others, to Lord John Gray, Lord Blantyre, and Mr. Hay of Drummelzier.

In the spring Of 1741, he went abroad with Mr. Hay, having also Lord Blantyre under his care. He resided some years at Utrecht, and thence made excursions into Flanders, France, and Germany. Carlyle met him -- " Immateriality Baxter," as he calls him -- at Utrecht in 1745, and says of him, 'though he was a profound philosopher and a hard student, he was at the same time a man of the world, and of such pleasing conversation as attracted the young." His son bad described him as being at polite assemblies in Holland, and a favorite of ladies; but a writer in the Corrigenda of the following volume of the " Biographia," after mentioning that he saw him daily for more than two years at Utrecht, declares: " His dress was plain and simple, -- not that of a priggish French man, but of a mathematician who was not a

sloven. I am pretty well persuaded that while in the Low Countries, he never had any conversation with women of higher or lower degree, unless it were to ask for the bill at an ordinary, or desire the servant maid to bring up the turf for his chimney." The same writer describes him as a "plain, decent, good humored man, who passed all his time, but {44} what was bestowed at his meals, in meditation and study." His son describes him as social and cheerful, and extremely studious, sometimes' sitting up whole nights reading and writing.

In 1724, he had married the daughter of Mr. Mebane, a minister in Berwickshire; and, while he was abroad, his wife and family seem to have resided at Berwick-on-Tweed. In 1747, he returned to Scotland, and resided till his death at Whittingham, in East Lothian, where he employed himself in country affairs, and in his philosophic studies. In his latter years, he was much afflicted with gout and gravel. In January 29, 1750, he wrote to (the afterwards notorious) John Wilkes, with whom he bad formed a friendship in Holland, " I am a trouble to all about me, especially my poor wife, who has the life of a slave night and day in helping to take care of a diseased carcass." He had long, be states, considered the advantages of a separate state, but " I shall soon know more than all men I leave behind me." He died April 13, 1750, and was buried in the family vault of Mr. Hay at Whittingham.

He wrote a book in two volumes entitled " Matho," being a compend of the universal scientific knowledge of the day. He published his principal work, " An Inquiry into the Nature of the Human Soul," in 1733,[10] and it reached a second edition in 1737. In 1750, shortly after his death, was published, "An Appendix to his Inquiry into the Nature of the Human Soul." He had taken a great body of manuscripts with him to Holland; in the letter referred to, he speaks fondly of his unfinished manuscripts, in which he had discussed " a great many miscellaneous subjects in philosophy of a very serious nature, few of them ever considered before, as I know of" In 1779, the Rev. Dr. Duncan of South Warnborough published from his manuscripts, after correcting the style, " The Evidence of Reason in proof of the Immortality of the Soul," and at the close is his letter to Wilkes. Another work of his, entitled " Histor," discussing, on the English side, the controversy between the British and Continental writers as to force, and on the side of Clarke, the controversy between Clarke and Leibnitz, was offered to Millar the bookseller; but the new generation did not appreciate his life-labors; his day was over, and the offer was declined.

The avowed design of Baxter, in all his works, is to establish the existence of an immaterial power. Such a defence seemed to him to be required, in consequence of the new views of the powers of matter founded on the discoveries of Sir Isaac Newton; by the equivocal language of Locke, frequently quoted about our not being "able to know whether any material being thinks or not;" and by the materialistic spirit abroad. The new doctrine of all matter attracting other matter seemed to show that we must be prepared to modify the old doctrine, that body is altogether passive.

Leibnitz, on metaphysical grounds, and in opposition to the accepted Cartesian {45} doctrine, had maintained that matter has an essential potency. Baxter proceeds on the doctrine of Clarke, the friend of Newton, and quotes his language. "All things that are done in the world are done either immediately by God himself, or by created intelligent beings; matter being evidently not at all capable of any laws or powers whatsoever, any more than it is capable of intelligence, excepting only this one negative power, that every part of it will always and necessarily continue in that state, whether of rest or motion, wherein it at present is. So that all those things which we commonly say are the effects of the natural powers of matter and laws of motion, of gravitation, attraction, or the like, are indeed (if one will speak strictly and properly) the effects of God's acting continually and every moment, either immediately by himself, or mediately by some created intelligent being," The first volume of Baxter's work on the "Nature of the Soul," his "Appendix" and a large part of his "Evidence," are mainly occupied with a full elucidation and elaborate defence of the views summarily expressed in this passage.

He labors to prove that a <vis inertiae>, or resistance to a change of present state of rest or motion, is essential to matter; that matter hath this and nothing else; that it cannot have any sort of active power; that what are called the powers of matter is force impressed upon it <ab extra>. He maintains that matter is "liable to but one change or casualty, /viz\., to be annihilated, or to be destroyed by a Being to whose power that effect is competent," and lie denies that Infinite Power may " superadd a property to a substance incapable of receiving it." He maintains this doctrine as resolutely as if it were the foundation of religion, which must stand or fall with it. The questions which he has taken up had been discussed in a profound manner by Descartes and Leibnitz, and they cannot be regarded as settled at this day. But from his dogma of the impotency of matter he argues the necessity of an immaterial powerful being who first made the dead substance, matter, who originally impressed, and still continues to impress, motion upon it. " I am of opinion, and think it would be easy to show it, if one bad leisure to run through the several particulars, that unless an immaterial power continually re-excited motion in the material universe, all would stop in it in a very short time, perhaps in half an hour, except that the planets would run out in straight-lined directions" ! ! "To say that Deity interposes when he sees that matter would go wrong, is the same thing, in other words, as owning that lie interposes always if that were proper. Every particle of matter resists a change of its present state, and therefore could not effect a change of state in itself nor in other particles." He would thus establish his conclusion, that the " Deity, who can be excluded from no place, but is active and present everywhere, acts immediately on all the parts of matter," and that his governing is only his creating power constantly repeated. "Our philosophy can only be consistent when we take in the immediate power of the Creator as the efficient cause in all the works of nature." He looks on his own position as being very much superior, in its religious aspects, to the doctrines which had been entertained by many

others. " Low and pitiful are the shifts we are put to when we would remove the Deity to the head of nature, and the head of nature out of sight." {46}

"It is not right to exalt the Deity in words and derogate from his perfections in facts. This is only paying him a compliment, and then setting aside his government in whole or in part, -- a state artifice. Cicero objects this low cunning to Epicurus, when he says, it is " verbis ponere re tollere." " Descartes, before Spinoza, had given the government of the universe to matter and motion; and Leibnitz, under a pretence of extolling the original contrivance of things, leaves the execution of all this to dead substance. According to all these schemes, we see nothing that the Deity does now: we behold only the operations of matter. This fills the mind with anxious doubts. If matter performs all that is wonderful, it catches our first admiration; and we know not where to search for the being who contrived that which we see matter executes with such dexterity." Much may be said in favor of the doctrine, that God acts in all physical action; but it is wiser not to found it on the peculiar dogma of Baxter, that matter is inactive.

But the grand aim of Baxter, in depriving matter of its powers, is to establish the immateriality, and consequent immortality, of the soul. It is a fundamental position with him, that "a power always belongs to something living." He is thus able to establish the existence of a human soul active and immortal. He maintains that " no substance or being can have a natural tendency to annihilation or become nothing," and argues that the soul must endlessly abide an active perceptive substance, without either fear or hopes of dying, through all eternity." When we find such positions coolly assumed, one almost feels justified in rejoicing that in that very age David Hume rose up to dispute all such dogmas; and that in the following age Emmanuel Kant examined narrowly the foundations both of rational theology and of rational psychology. We are certainly warranted in feeling a high gratification that Thomas Reid, a wiser man than any of these, did immediately after the time of Hume, and before the time of Kant, set about establishing natural religion and philosophy upon a safer foundation.

Baxter is prepared to follow out his principles to all their consequences, however preposterous they might appear. The phenomena of dreaming came in his way, and he gives an explanation of them. He cannot refer these dreams to dead matter, nor can it be the soul that forms the scenes present to it. His theory is, that separate immaterial beings act upon the matter of our bodies, and produce on the sensory a [Greek term] or vision, which is perceived by the active and recipient mind. He acknowledges that he knows nothing of the conditions and circumstances of these separate agencies, but he evidently clings to the idea that there is no scarcity of living immaterial beings, and asks triumphantly: "Why so much dead matter, without living immaterial substance in proportion? " " Hath not the most despicable reptile animalcule an immaterial soul joined to it?"

It ought to be added, that in his " Evidence " be

adduces stronger arguments, than those derived from his favorite view of matter, in favor of the soul's immortality. He shows that if there be no state beyond the grave, our existence is incomplete, without design, irrelative; and he calls in the divine perfections as furnishing 'a certain ground of confidence that our existence will not be finally broken off in the midst of divine purposes thus visibly unfinished here," and securing that beings "becoming good for {47} something should not instantly become nothing." In arguing thus, be shows his besetting tendency to take up extreme positions; for lie maintains that in our world pain is much more extensive in its nature than pleasure, and that all bodily pleasures are merely instigations of pains. He argues that as in this world reason may often be disobeyed with no evil consequences and obeyed without any good ones, so there must be a future world to make every thing consistent with reason. He shows that the prepossessions of mankind are in favor of this tenet. " In the very dawnings of reason, let a child be told what is death, having no idea of any way of existing beside the present, amazement seizes him: lie is perplexed, uneasy, dismayed." He is met, as so many others have been, by the objection, that most of these arguments would prove that brutes are immortal. In answering it, he is obliged to allow that immortality does not depend solely on immateriality, and to throw himself on the moral argument, which does not apply to brutes, which, not being moral agents, are not capable of rewards and punishments. But it is clear that he cherishes the idea that the immaterial part of brutes, while not constituting the same conscious being, may not perish ultimately when separated from the material frame.

In treating of these favorite topics, he discusses a great many important philosophic questions, and always gives a clear and decided opinion. He evidently favors the arguments derived from "abstract reason and the nature of things" in behalf of the divine existence. He argues the necessity of an infinitely perfect intelligent being, -- not only from space and time, as Clarke did, but from the necessity of eternal truth in geometry or in other abstract sciences." Truth is not a being existing by itself, and therefore the immutable necessary nature of truth must be referred to some being existing of itself, and existing immutably and eternally." We have only to define truth as the conformity of our ideas to things, to see the fallacy lurking in this argument.

His view of space and time is taken from Newton and Clarke. He represents them as not beings, but the affections of beings: " And as time and space are not existences, so their correlate infinites (if I may say so), that is, eternity and immensity, are not existences, but the properties of necessary existence." In some other of his statements, be goes back to some of the mystic statements of the schoolmen, and anticipates some of the doctrines of Kant. "God's existence is unsuccessive." He says, "<Nunc stans> implies opposite ideas, if applied to our existence; but if we allow an eternal and immutable mind, the distinction of past and future vanishes with respect to such a mind, and the phrase has propriety." But surely there is an inconsistency in first arguing the divine existence from

our ideas of space and time, and then declaring that our ideas in regard to space and time do not apply to Deity.

In maintaining that mind is ever active, he has to consider its seeming dormancy in sleep. "The soul in sleep seems to suffer something like what happens to a live coal covered up under ashes; which is alive all the while, but only appears so when disencumbered and exposed to open air." As to what has since been called unconscious mental action, his theory of it is the same as that defended in after years by D. Stewart; he supposes {48} that the mind was conscious of its action at the time, but that the memory could not recall it. "There is certainly a great deal of our past consciousness which we retain no memory of afterwards. It is a particular part of our finite and imperfect nature, that we cannot become Conscious of all our past consciousness at pleasure. But no man at night would infer that he was not in a state of consciousness and thinking at such a certain minute, about twelve o'clock of the day, because now perhaps he hath no memory what particular thought be had at that minute. And it is no better argument, considered in itself, that a man was not conscious at such a minute in his sleep because next morning he hath no memory of what ideas were in his mind then."

Baxter was most earnest in restricting the properties of matter, but he was equally resolute in maintaining its existence. In his work on the soul he has a long section on " Dean Berkeley's scheme." He was one of the first who examined systematically the new theory. He takes the obvious and vulgar view of it, and not the refined one ascribed to the ingenious author by his admirers: for those who have opposed Berkeley have usually given one account of his system, while those who have defended him have usually given another; and some have thence come to the conclusion, that his whole theory is so ethereal that it is not capable of definite expression. Baxter maintains that " we perceive, besides our sensations themselves, the objects of them that " we are conscious not only of sensation excited, but that it is excited by some cause beside ourselves," and that "such objects as rivers, houses, mountains, are the very things we perceive by sense." He endeavors to prove that the system of Berkeley carried out consistently would land us in a solitary egoism, for " we only collect concerning the souls of other men from the spontaneous motions and actions of their bodies; these, according to him, belong to nothing." Berkeley had boasted that, by expelling matter out of nature, he had dragged with it so many sceptical and impious notions; Baxter replies that this " puts us into a way of denying all things, that we may get rid of the absurdity of those who deny some things," -- " as if one should advance that the best way for a woman who may silence those who attack her reputation is to turn a common prostitute." He thinks that the doctrine may tend to remove the checks to immorality; for "he who thinks theft, murder, or adultery nothing real beyond bare idea, and that for aught we know be injures nobody, will be surely under less restraint to satisfy his Declinations of any kind." The mathematician is evidently annoyed and vexed at the attacks which Berkeley bad made on his science, and shows "that if there be no such thing as quantity, we have a large body of

immutable truths conversant about an impossible object."

In examining Berkeley he gives his views of sense-perception, which are not so clear and satisfactory as those of Reid; but are vastly juster than those of his contemporaries. He distinctly separates himself from those who hold that the mind can perceive nothing but its own states. " If our ideas have no parts, and yet if we perceive parts, it is plain we perceive something more than our own perceptions." He adds "We are conscious that we perceive parts as that we have perceptions at all." The {49} existence of matter in general, or at least of material sensories to which the soul is united, seems to me to be nearer intuitive than demonstrative knowledge." He declares that the "same perception of parts proves to us both the spirit and a material agency." This is so far an anticipation of the doctrine of Hamilton as an advance upon that of Reid. As to the manner of the action of matter on spirit, and spirit on matter, he says, in the very spirit of Reid. " We are certain this is matter of fact in many instances, whether we conceive it or not." He adds, in his own manner: " The Deity himself moves matter in almost all the phenomena of nature, and the soul of man perhaps moves some matter of the body, though in an infinitely less degree."

VII. -- FRANCIS HUTCHESON.[11]

D/URING\ the greater part of the seventeenth century there was a constant immigration into the north-east of Ireland of Scotch men, who carried with them their hardy mode of life and persevering habits; their love of education and their anxiety to have an educated ministry; their attachment to the Bible and the simple Presbyterian worship. This movement commenced with the attempt of the first James of England to civilize Ireland by the Plantation of Ulster, and was continued during the period of the prelatic persecution in Scotland, whereby not a few sturdy adherents of the Solemn League and Covenant were driven for refuge to the sister isle. The Scottish Church kept a watchful guardianship over her scattered children, and sent after them a succession of ministers to preach the gospel, for a time in the Established Church, and, when churchmen from England (such as Jeremy Taylor) would not tolerate this any longer, to set up a Presbyterian organization. Among these was the Rev. Alexander Hutcheson, the second son of an old and respectable family at Monkwood, in Ayrshire, who became minister at Saintfield, in the heart of county Down, and purchased the townland of Drumalig. His second son ' 'John, was settled at Ballyrea, within two miles of Artnagh, and ministered to a Presbyterian congregation in the archiepis opal city, where he {50} was known by his church as a man of retiring habits and of superior abilities, and a firm supporter of Calvinistic doctrine. His second son, Francis, was born Aug. 8, 1694, it is said in his grandfather's house in Drumalig.[12] When about eight years of age, he (with his elder brother, Hans) was put under the care of the same grandfather, and attended a classical school kept by Mr. Hamilton in the "meeting house" at Saintfield. He was afterwards sent to Killyleagh, in the same county, to an

academy kept by the Rev. James Macalpin, said to be a man of virtue and ability, and who taught the future metaphysician the scholastic philosophy. We have it on record, that the Presbyterian Church of Ireland -- seeking now, after coming through a long period of harassment and trouble, to work out its full educational system --did about this time set up several such schools for philosophy and theology. However, the great body of the young men intending for the ministry did then, and for more than a century after, resort to the University of Glasgow for their higher education. Of this college Hutcheson became a student about 1710 (he does not seem to have matriculated till 1711). During his residence with his grandfather he became such a favorite with the old man, that when he died in 1711, it was found that he bad altered a prior settlement of his family affairs, and, passing by the older grandson, had left all his landed property to the second. Francis, though a cautious, was a generous youth: he had all along taken pains, even by means of innocent artifices, to uphold his brother in the old man's esteem; and now he refused to accept the bequest, while Hans, with equal liberality, declined to receive what had been destined for another; and the friendly dispute had at last to be settled by a partition of the lands, which again became united when Hans, dying without issue, left his share to the son of Francis.

Francis Hutcheson thus sprang, like Gershom Carmichael (and we shall afterwards see George Turnbull), from the old {51} orthodox Presbyterian Church and its educated pastors; and both were early nurtured in the scholastic logic, from which they received much benefit. But Hutcheson comes an age later than Carmichael, and falls more thoroughly under the new spirit which has gone abroad.

At Glasgow the youth followed the usual course of study in the classical languages and philosophy, and enjoyed the privilege of sitting under the prelections of Carmichael. In after years, when called back to be a professor in the college, he gives in his Introductory Lecture a glimpse of the books and branches in which he felt most interest in his student life. After referring to the pleasure which he experienced in seeing once more the buildings, gardens, fields, suburbs, and rivers' banks (more pleasant then than now), which had been so dear to him, he expresses the peculiar gratification which he felt in revisiting the place where he had drunk the first elements of the quest for truth; where Homer and Virgil, where Xenophon, Aristophanes, and Terence, where the philosophy of Cicero and the discussions of the Fathers, had been opened to him; and where be had first been taught to inquire into the nature and reasons (<rationes>) of virtue, the eternal relations of number and figures, and the character of God. Having taken the Master's degree in 1712, he entered, the following year, on the study of theology under Professor John Simson. This professor was at that time, and, indeed, for the greater part of the period from 1712 to 1729, under prosecution before the ecclesiastical courts for teaching doctrines inconsistent with the Confession of Faith. It appears from the charges brought against him, and from his shuffling and vacillating explanations (he was often in a shattered state of health), that he took a favorable view of the state of

the heathen; that he was inclined to the doctrine of free-will; he maintained that punishment for original sin alone was not just; he held that rational creatures must necessarily seek their chief good, -- always under subserviency to the glory of God, who cannot impose a law contrary to his own nature and to theirs, and who cannot condemn any except those who seek their chief good in something else, and in a different way than God has prescribed: but the special charge against him was, that he denied that Jesus Christ is a necessarily existent being in the same sense as the Father is. The lengthened process {52} concluded with the General Assembly declaring, in 1729, that Mr. Simson was not fit to be intrusted with the training of students for the ministry. It does not appear that young Mr. Hutcheson ever threw himself into this agitation on the one side or other, but it doubtless left its impression on his mind; and this, I rather think, was to lead him to adopt, if not the doctrine, at least some of the liberal sentiments of Simson; to keep him from engaging in religious controversy, and to throw him back for certainty on the fundamental truths of natural theology and the lofty morality of the New Testament.

To the teaching of Simson the historians of the Church of Scotland are accustomed to trace the introduction of the " New Light " theology into the pulpits both of Scotland and Ulster. But there were other and deeper causes also at work, producing simultaneously very much the same results all over the Protestant Continent of Europe, and in England both in the Church and among Non-conformists. It was a period of growing liberality of opinion, according to the view of the rising literary men of the country. It was a time of doctrinal deterioration, followed rapidly by a declension of living piety, and in the age after of a high morality, according to the view of the great body of earnest Christians. In the preceding age, Milton, Newton, and Locke had abandoned the belief in the divinity of Christ, and the great Church of England divine of that age, Samuel Clarke, was defending the Arian creed, and setting aside the Reformation doctrine of grace. Francis Hutcheson, by this time a preacher, writes from Ireland to a friend in Scot land, in 1718, Of the younger ministers in Ulster: "I find by the conversation I have had with some ministers and comrades, that there is a perfect Hoadley mania among our younger ministers in the north; and, what is really ridiculous, it does not serve them to be of his opinions, but their pulpits are ringing with them, as if their hearers were all absolute princes going to impose tests and confessions in their several territories, and not a set of people entirely excluded from the smallest hand in the government anywhere, and entirely incapable of bearing any other part in the prosecution but as sufferers. I have reason however, to apprehend that the antipathy to confessions is upon other grounds than a new spirit of charity. Dr. Clarke's work (on the Trinity), I'm sufficiently informed, has made several {53} unfixed in their old principles, if not entirely altered them." Hutcheson never utters any more certain sound than this on the religious controversies of his day. It is evident that his mind is all along more inclined towards ethical philosophy and natural theology. It is interesting to notice

that, in 1717, he wrote a letter to S. Clarke stating objections to his famous " Demonstration of the Being and Attributes of God," and that he received a reply, both of which are lost. We are reminded that, about four years before this, Joseph Butler, then a youth of twenty-one, at a dissenting academy, had written Clarke, taking exception to certain points in his "Demonstration," and had received answers to his letters. The objections of Hutcheson must have been more fundamental as to method than those of Butler. He was convinced that, as some subjects from their nature are capable of demonstration, so others admit only of probable proof, and he had great doubts of the validity of all metaphysical arguments in behalf of the existence of Deity. Dr. Leechman tells us: "This opinion of the various degrees of evidence adapted to various subjects first led Dr. Hutcheson to treat morals as a matter of fact, and not as founded on the abstract relation of things."

During his student life he was tutor for a time to the Earl of Kilmarnock. Leaving college about 1716, he was licensed to preach the gospel by the Presbyterian Church in Ireland. His preaching does not seem to have been acceptable to the people, who were alarmed at the New Light doctrine which was creeping in among them, and felt that the young preacher's discourses were scarcely in the spirit of the Scriptures, as they were not after the model of the ministers and divines whom they reverenced.[13] However, he received a call from a country {54} congregation at Magherally, in his native county, but was easily persuaded to accept instead an invitation to open an academy in Dublin, to give instruction in the higher branches. About the time he settled there the Protestant Non-conformists, aided by the government, but after a keen opposition from the Irish bishops, had succeeded in obtaining a parliamentary repeal of the Acts which required all persons to resort to their parish church every Sunday, and imposed a fine of L100 upon the dissenting minister who officiated in any congregation. But the young teacher had to suffer two prosecutions in the Archbishop's court for daring to teach youth without subscribing the canons and obtaining a license. These attacks upon him came to nothing, as they were discouraged by the Archbishop. Dr. King, author of the metaphysical work on the " Origin of Evil," who, though he had been a determined opponent of the relaxation allowed by law to dissenters, was unwilling to oppress so accomplished a man and well-disposed a citizen as Hutcheson. In Dublin he had laborious duties to discharge, which left him, he complained, little time for literature and mental culture; but he seems to have met with congenial society. The Presbyterians and Independents were the representatives of the English Non-conformists, who had been a considerable body there when Henry Cromwell was vice-regent, and when Winter and Charnock preached to them in Christ's Church Cathedral; and they had among them families of standing and influence. His literary accomplishments opened other circles to him. There seems to have been at that time a considerable taste for learning and philosophy in the metropolis of Ireland. From a very early date after its publication, the " Essay on the Human {55} Understanding," had been most enthusiastically welcomed by Molyneux, who corresponded with Locke, and expressed his excessive admiration of him.

Berkeley, the tutor of Molyneux's son, began in 1707 to give to the world his ingenious speculations on mathematical and philosophical subjects. It does not appear that Hutcheson was acquainted with Berkeley, who, we rather think, would not appreciate the views of Hutcheson: be has certainly condemned the opinions of Shaftesbury. But he enjoyed the friendship of a number of eminent men, including Viscount Molesworth and Dr. Synge afterwards Bishop of Elphin; both of whom encouraged him to publish his first work, and assisted him in preparing it for the press. The former connects him historically with Shaftesbury, who had written letters to Molesworth, which were published in 1721. When in Dublin, Hutcheson and some others formed a club in which papers were read by the members on philosophic themes. It is an interesting circumstance, that in the next age some of the more important works of Gerard, Reid, Beattie, and Campbell sprang out of a similar society in Aberdeen.

It was in 1725 that he published in London his first work, "An Inquiry into the Original of our Ideas of Beauty and Virtue." The treatise was published anonymously, as (so he tells us in the second edition) he had so little confidence of success that he was unwilling to own it. The subject, the thoughts, and the style were suited to the age; and the work was favorably received from the first. Lord Granville (afterwards Lord Carteret), the Lord Lieutenant of Ireland, sent his private secretary to inquire at the bookseller's for the author; and when he could not learn his name he left a letter to be conveyed to him, in consequence of which Hutcheson became acquainted with his Excellency and was treated by him with distinguished marks of esteem. A second edition, corrected and enlarged, was called for in 1726.

This was the age of serial literary essays which had commenced in England with the "Tatler" and "Spectator." There was such a periodcal set up in the metropolis of Ireland called the "Dublin Journal" conducted by Hibernicus (Dr. Arbucle), and to this paper Hutcheson sent two letters, of date June 5th and June 12th, 1725, on " Laughter," in opposition to the views of Hobbes, who attributed men's actions to selfish motives, and {56} represented laughter as nothing else but sudden glory arising from some sudden conception of some eminency in ourselves, by comparison with the infirmity of others or our own formerly. He characterizes Hobbes as "having fallen into a way of speaking which was much more intelligible than that of the School men," and "so becoming agreeable to many wits of his age;" and as "assuming positive, solemn airs, which he uses most when he is going to assert some solemn absurdity or some ill natured nonsense." He finds it difficult to treat the subject of laughter "gravely," but gives his theory of the cause of laughter, which is "the bringing together of images which have contrary additional ideas, as well as some resemblance in the principal idea g, this contrast between ideas of grandeur, dignity, sanctity, perfection, and ideas of meanness, baseness, profanity, seems to be the very spirit of burlesque, and the greater part of our raillery and jest are founded on it." Some such view as this has ever since been given of wit. Samuel Johnson describes it as a sort of <Concordia discors or concors discordia>. Hutcheson

ventures to specify the use of laughter: "Our passions are apt to lead us into foolish apprehensions of objects both in the way of admiration and honor, and ridicule comes in to temper our minds." This moderate view falls considerably short of that given by Shaftesbury, who represents ridicule as a test of truth.

Mandeville, in "The Fable of the Bees," had advanced some curious and doubtful speculations as to private vices being public benefits; showing that the power and grandeur of any nation depend much upon the number of people and their industry, which cannot be procured unless there be consumption of manufactures; and that the intemperance, luxury, and pride of men consume manufactures, and promote industry. The author has here caught hold of a positive and important truth, the explanation of which carries us into some of the deepest mysteries of Providence, in which we see good springing out of vice, and God ruling this world in spite of its wickedness, and by means of its wickedness, but without identifying himself with it. But Mandeville was not able to solve the profound problem, and in dealing with it he uses expressions which look as if he intended to justify, or at least to palliate vice. Hutcheson hastens to save morality, and writes letters on the subject to Hibernicus, {57 } and easily shows that virtue tends to private and public happiness, and vice to private and public misery; and that there "would be an equal consumption of manufactures without these vices and the evils which flow from them."

Hutcheson had now tasted the draught of authorship, and must drink on. In the "London Journal" for 1725 there appeared some Letters signed "Philaretus," containing objections to the doctrine of the "Inquiry into the Ideas of Beauty and Virtue," which is represented as not giving a sufficiently deep view of virtue as founded on the nature of things and perceived by reason. Hutcheson replies in the same journal. In that same year he published his second great work, being " An Essay on the Nature and Conduct of the Passions and Affections, with illustrations of the Moral Sense." In the Preface he says, " Some Letters in the ' London journal,' in 1728, subscribed 'Philaretus,' gave occasion to the Fourth Treatise (on the Moral Sense); the answer given to them in these weekly papers bore too visible marks of the hurry in which they were wrote, and therefore the author declined to continue the debate that way, choosing to send a private letter to Philaretus to desire a more private correspondence on the subject of our debate. He was soon after informed that his death disappointed the author's great expectations from so ingenious a correspondent." Philaretus turned out to be Gilbert Burnet (second son, I believe, of the bishop), and the correspondence was published in 1735, with a postscript written by Burnet shortly before his death. Burnet examines Hutcheson from the stand-point of Clarke, and fixes on some of the weak points of the new theory.

At this time there was a keen controversy in Ulster as to whether the Presbyterian Church should require an implicit subscription to the Westminster Confession of Faith, and this issued in those who refused to subscribe forming themselves into a separate body called the Antrim

Presbytery, the members of which published a " Narrative of the Proceedings of the Seven Synods," which led to their separation. The work of replying to this document was committed to Mr. Hutcheson, of Armagh, whose paper, however, was not published till after his decease, which took place in February, 1729. The old man had anxieties about his son, lest he should be tempted by the flattering attentions paid him in Dublin to conform to the Established {58} Church, and wrote a letter expressing his fears. We have the reply of the son, of date Aug. 4, 1726. In this he avows that he did not regard the "government or externals of worship so determined in the gospel as to oblige men to one particular way in either:" that he looks upon the established form as an "inconvenient one;" that he reckons the dissenters' cause "in most disputed points the better;" that he believes the original of both civil and ecclesiastical power is from God; he denounces those religious penal laws which "no magistrate can have a right to make;" but he would not blame any man of his own principles who did conform, if the "ends proposed were such as would over-balance the damage which the more just cause would sustain by his leaving, particularly if he had any prospect of an unjust establishment being altered," of which, he confesses, he does not see the least probability. He says, that both Lord Cathcart and the Bishop of Elphin had professed their desire to have him brought over " to the Church, to a good living; " that he kept his mind "very much to him self in these matters, and resolved to do ," but that he had no intention whatever to depart from his present position, and that he would feel it his duty continually to promote the cause of dissenters. I rather think that this frank but expediency letter would not altogether satisfy the good old father, who had stood firm on principle in trying times. I have referred to these transactions, because they exhibit the struggles which were passing in many a bosom in those times of transition from one state of things to another. Hutcheson never conformed, as his contemporary Butler did, to the Church. His Presbyterian friends were soon relieved from all anxieties in this direction by his being appointed, after be had been seven or eight years in Dublin, to an office altogether congenial to his tastes, in Glasgow University, where, however, he exercised a religious influence which his father, provided he had been spared to witness it, would have viewed with apprehension and disapproval.

He was chosen to succeed Carmichael, Dec. 19, 1729, by a majority of the Faculty, over Mr. Warner, favored at first by the principal, and over Mr. Frederick Carmichael, son of Gershom, supported by five of the professors. His appointment could be justified on the ground of merit; but he owed it mainly {59} to family connections, who gained Lord Isla, the great government patron of the day, before whom the principal had to give way.[14] In October, 1730, twenty English students have come to the college, expecting Mr. Hutcheson -- whose " Inquiry " and work on the " Passions " were already well known -- to " teach morality Professor Loudon, however, insisted that he had a right to take the chair of Moral Philosophy, whereupon the English students gave in a paper declaring that, if Mr. Hutcheson, who had not yet come over from Ireland, did not teach them morality, they would set off to Edinburgh, and Mr. Loudon

had to yield. On November 30, he was publicly admitted, and delivered, in a low tone and hurried manner, as if awed and bashful, an inaugural discourse, "De Naturali Hominum Socialitate," in which he expounds, in a clear and pleasant manner, and in good Latin, his favorite doctrine as to man having in his nature disinterested affections. He maintains, in opposition to the "very celebrated" Locke, that man has something natural, but admits that it requires time and circumstances to bring it forth; and in opposition to Hobbes and Puffendorff, that man can be swayed by other motives than self-love. He represents the conscience as the [Greek term] to which all our nature ought to be subjected, and to which it had been subjected in our entire state; but admits that our nature is fallen, weakened, and corrupted, in many ways. Hutcheson lectured five days a week on his proper course, which embraced Natural Religion, Morals, jurisprudence, and Government; and at another hour he read three days of the week, with his students, some of the finest writers of antiquity, Greek and Latin, on the subject of morals; interpreting both the language and sentiment. This practice of combining reading with lectures was followed by his successors in the moral chair in Glasgow, and is vastly superior to the plan of the Edinburgh professors of a later date, who instructed their pupils only by reading lectures. His prelections were at first, after the manner of the times, in Latin; but he had the courage to break off from the ancient custom, and to speak in the English tongue, no doubt to the great joy and benefit of the students, who might lose somewhat in not being familiarized with the ancient learned language; but would gain vastly more in being brought into close sympathy with the {60} speaker, in listening from day to day to elegant English, and in the mastery which they would thereby acquire over their own tongue. Dr. Carlyle has left us a picture of the lecturer: "I attended Hutcheson's class this year (I 743-44) with great satisfaction and improvement. He was a good-looking man, of engaging countenance. He delivered his lectures without notes, walking backwards and forwards in the area of his room. As his elocution was good, and his voice and manner pleasing, he raised the attention of his hearers at all times; and when the subject led him to explain and enforce the moral virtues, he displayed a fervent and persuasive eloquence which was irresistible." A like account is given of him by his professed biographer Leechman: "A stature above middle size, a gesture and manner negligent and easy, but decent and manly, gave a dignity to his appearance. His complexion was fair and sanguine, and his features regular. His countenance and look bespoke sense, spirit, kindness and joy of heart," It may be added that this is the very impression left as we gaze on his portrait, with wig and gown, with florid face, and easy but dignified air, in the common hall of Glasgow College. Leechman represents him as dwelling in his lectures in a more diffuse manner on such moral considerations as are suited to touch the heart, and excite a relish for what is truthful and noble; and by his vivacity of thought, and sensibility of temper, commanding the attention of his students, and leaving strong impressions on their minds.

In the college he had an eminent colleague in Mr. Robert Simson (nephew of the theological professor), and a

congenial one in Mr. Alexander Dunlop, the professor of Greek. Mr. Simson was an eccentric man, who spent his time between severe geometrical studies in the morning, and social meetings in the tavern at which he lived, or in his club, in the evening. Hutcheson and Dunlop -- who was a man of strong sense and capacity for business -- got the credit of managing all the affairs of the university, and both exerted themselves to maintain the discipline of the college and foster its literary tastes. In particular, Hutcheson had great success in reviving the study of ancient literature, particularly the Greek, which had been much neglected in the university before his time. At a later date, he had associates of a kindred spirit in the elegant {61} and grave Dr. Leechman, professor of theology (afterwards principal); in the lively and learned Dr. Moor, first the librarian of the college, and in 1746 made professor of Greek; and in the two eminent printers, Robert and Andrew Foulis, who published a multitude of learned works, including many of Hutcheson's. With such a spirit reigning in the college, and a great thirst for education on the part of the Scottish youth, fostered by the parish and burgh schools, the class-rooms were filled with students. Carlyle, who had just come in 1743 to Glasgow, after having been at Edinburgh College, describes the spirit that reigned among the youths: "Although at the time there appeared to be a marked superiority in the best scholars and most diligent students of Edinburgh, yet in Glasgow learning seemed to be an object of more importance, and the habit of application was much more general," -- a description which applies equally to Glasgow in after years. He mentions that among the students there were sundry young gentlemen from Ireland, with their tutors; and he names, among young men of station attending, Walter Lord Blantyre, Sir -- Kennedy and his brother David, afterwards Lord Cassilis. Walter Scott of Harden, James Murray of Broughton, and Dunbar Hamilton, afterwards Earl of Selkirk. The Scotch colleges were quite competent at that time to educate the nobility of the country, who had not yet fallen into the way of going to the great English schools and colleges, there to lose their national predilections and become separated, as they did in succeeding ages, from the sympathies, social, political, and religious, of the middle classes and common people of Scotland, to the great injury of the church and the nation generally.

Hutcheson exercised a special influence in drawing students, Scottish, Irish Presbyterian, and English Non-conformist, to the college. His own class was so large that he had to employ an assistant. The Calvinistic creed of the south-west of Scotland, the theological preaching of the old-school ministers, and the training of the young in the Shorter Catechism, all inclined the students to mental philosophy; and in Hutcheson they had much to attract, and little to offend. When he set before them wide fields of knowledge; when, in his lectures on natural theology, he pointed out evidences of the wisest contrivance and {62} most beneficent intention; when he led them from the external world into the still greater wonders of the internal, and traced the parts of man's moral constitution, and described the virtues in their loveliest form, and enlarged on the elevated enjoyments furnished by them; when he quoted, with glowing zest, the noblest passages of Greek

and Roman literature; when he inculcated, with immense enthusiasm, the importance of civil and religious liberty, -- the students felt as if a new world were thrown open to them, and a new life kindled within them. Following the custom of his predecessor, he lectured on the sabbath evenings on the truth and excellence of Christianity, and the students of all the classes eagerly rushed to his prelections. The conversation of the youths in their social walks and visits often turned on the literary and philosophic themes which he discussed, and some of them chose to attend his lectures for four or five successive years. Among his pupils were Mr. Millar, afterwards President of the Court of Session; Archibald Maclaine, who in future years translated Mosheim's " Ecclesiastical History;" Matthew Stewart, famous for his Mathematical Tracts, and father of Dugald Stewart; and a youth, specially appreciated by Hutcheson, with a vast capacity for learning of every kind, and destined in future years to be so famous in Hutcheson's own department, -- Adam Smith, author of " The Theory of Moral Sentiments," and of " The Wealth of Nations." All of these ever spoke of Hutcheson in terms of high admiration and gratitude.

Defoe describes the city of Glasgow, with its four principal streets meeting in a cruciform manner at a point, as being, in 1726, one of the cleanliest, most beautiful, and best built cities in Great Britain. On the street that ran toward the north stood the college, completed in 1656, with quadrangles, arcade, and spire, built after the style of Louis XIII. and Louis XIV. The population, when Hutcheson was a professor, might be upwards of twenty thousand. At the summit of the social scale were the foreign merchants engaged in the American trade, in which they carried out linen and brought back tobacco " the tobacco merchants, with their scarlet cloaks and gold-headed canes, and cocked hats, perched on powdered hair or wig, with dangling clubtie or pigtail." Next to them, but at a considerable distance, were the ordinary shopkeepers; and farther {63} down, the tradesmen and servants; while at the base were the Highlandmen, with their tartan jacket and kilts, driven from their native hills by starvation, and ready to perform the most servile work. All classes made a solemn religious profession; but Wodrow mourns over degenerate customs which wealth and luxury were introducing. The better citizens dined early in their own homes, without show; and many of them spent their evenings in social meetings at taverns, -- a practice which gendered those drinking customs which, beginning with the upper classes about this time, went down to the peasant class in the days of Burns, and by the end of the century infected the whole of Scottish society, which has not yet recovered from the evil influence. But Hutcheson does not seem to have been much mixed up with the citizen life of Glasgow; we do not hear of his spending his evenings in the tavern, or being a member of any of the social clubs which began to spring up in Glasgow at this time. He had experience of the evil effects of the new habits (which were coming in with the new theology), in the lives of some of the Irish students who were committed to his care, and over whom he watched with the most friendly interest. "The wretched turn their minds take is to the silly manliness of taverns." He satisfies himself with keeping personally free

from the evil. He presses his friend Tom Drennan, from Belfast, to pay him a visit for a month or six weeks, and promises: "Robert Simson, with you and Charles Moor, would be wondrous happy till three in the morning; I would be with you from five to ten."

His sphere was within the walls of the college; whence, how ever, his influence spread over the educated mind of the south west of Scotland and of Ulster, and over not a few of the Non-conformists in England. Carlyle tells us that he was believed by the students to be a Socinian. There is no evidence of this, nor of his expressing any positive opinion on any doctrinal subject. Even in his Sabbath evening lectures he kept to Grotius "De Veritate Christianae Religionis," and avoided, Leechman tells us, " the party tenets or scholastic system of modern ages." He seems to have maintained a friendly communication with the non-subscribing Presbyterian ministers in Ireland, some of whom (such as Abernethy and Leland, and Bruce and Boyce) were as accomplished men as any theologians {64} of their age, and of whom it may be said to their credit, that they suffered in their temporal interests rather than subscribe articles which they did not believe. In particular, Hutcheson carried on a very genial correspondence with the Rev. Thomas Drennan, a non-subscribing minister at Belfast.[15] The ministers of this communion, more especially as they were often abandoned by the people when their views became known, were at times in very poor circumstances. On hearing this, Hutcheson writes to his friend (May 31, 1742) am concerned that in my prosperous circumstances I did not think of it sooner. If you have any little contributions made towards such as are more distressed than the rest, you may mark me as a subscriber for L5 <per annum>, and take the above ten pounds as my payment for two years past. . . . I think it altogether proper you should not mention my name to your brethren, but conceal it. I am already called New Light here. I don't value it for myself, but I see it hurts some ministers who are most intimate with me. I have been these ten days in great hurry and perplexity, as I have for that time foreseen the death of our professor, who died last Wednesday, and some of my colleagues join me in laboring for Mr. Leechman to succeed. We are not yet certain of the event, but have good hopes. If he succeed, it will put a new face upon theology in Scotland."

This was no doubt one of the ends for which Hutcheson lived and labored, "<to put a new face upon theology in Scotland>."[16] Discouraging all doctrinal exposition, and all rousing appeals to the conscience, he would have the preachers recommend the Christian religion as embracing a pure morality, and holding out the hope of a blessed immortality; but meanwhile providing no pardon to the poor sinner anxious about the past, nor gracious aid to help him in his struggles to deliver himself from sin in the future. Never avowing any doctrinal belief, his students {65} looked upon him as a Socinian, and so his influence went in that direction. The crop that sprang up may be taken as represented by such men as Carlyle, elegant and accommodating but dreadfully rankled by a Calvinistic creed which they had to swear, and by the opposition of the people, who could not be made to feel that the New Light was

suited to them, or to believe that it had any title to be called a religion. But all this was in the future, and was not the precise result expected b), Hutcheson. Meanwhile he rejoices in Leechman, and describes him as one " who sees all I do." It seems that the Scotch divine received a call from a non-subscribing congregation in Belfast, and Hutcheson is rather inclined that he should go; he is so anxious to have him out of "that obscure place where he was so much lost," and where he was "preaching to a pack of horse-copers and smugglers of the rudest sort," who, we venture to say, would not profit much by that calm, abstract, elegant style which so pleased the professor of moral philosophy. Hutcheson uses every means to secure Leechman's appointment to the chair of theology in Glasgow, and brings influence of a very unscrupulous character (as I reckon it) to carry his point. He writes Mr. Mure of Caldwell (Nov. 23, 1743) that he wants a letter from the Duke of Montrose, the Chancellor of the University, in behalf of Leechman to Morthland, professor of Oriental languages, to be shown to others, and he malignantly mentions that Professor Anderson, the chief opponent of Leechman, " made himself ridiculous to all men of sense by dangling after Whitefield and M'Cullogh " (" Caldwell Papers "); and he wants this to be specially known to Tweeddale, who was Secretary of State for Scotland, and to Andrew Mitchell, his private secretary' It seems that the advocates of liberality could not tolerate that a man should be favorable to a revival of religion. It was by such means that " a new face was to be put upon the theology of Scotland." He writes to his Belfast friend (Feb. 20, 1743-44): I could tell you a good deal of news upon the unexpected election of a professor of divinity, and the furious indignation of our zealots." He had written previously (March 5, 1738-39): "I hope Jack Smith has sent down to your town a 'Serious Address to the Kirk of Scotland,' lately published in London; it has run like lightning here, and is producing some effect; the author is unknown; 'tis wrote {66} with anger and contempt of the Kirk and Confession, but it has a set of objections against the Confession which I imagine few will have the brow to answer." The moderate party in the Church of Scotland is being crystallized by coldness out of the floating elements; and already there is a felt polar antipathy between them and those whom they choose to call " zealots." Hutcheson writes (April 16, 1746), " I would as soon speak to the Roman conclave as our presbytery."

The professor of theology introduced by him to the college, had signed the Confession of Faith, and professed his willingness to sign it at any time. He accomplished the end of Hutcheson. The subjects represented by him as suitable to be dwelt on by the preacher from the pulpit, were the perfections of God; the excellence of virtue, and the perfection of the divine law; the truth of the Christian religion, and the important purposes for which Jesus came into the world; the great doctrines he taught the interesting scenes of providence he has displayed to men the dignity and immortality of the soul, and the inconceivable happiness of the heavenly state. In the social circle he was grave and silent, but is represented by Carlyle as having a lively wife, who entertained the students that came to his

house in the evening, and was anxious to hear about the new plays and novels which were coming into Scot land. He set out a body of young preachers, who unfortunately lost the common people, and the pious of all ranks, without gaining the worldly and unbelieving. He published a sermon in which he thought to recommend prayer as fitted to have an influence on the mind of the person praying, and submitted a copy to Hume, who told him plainly that the person praying must believe that his prayers have an influence on God and bring an answer.

It should be allowed that Hutcheson was most anxious to impart a taste for learning and refinement to the ministers of the Church of Scotland. He was deeply impressed with the evils which were springing from the law of patronage being now put in operation with a high hand. In 1735, he published " Considerations on Patronage, addressed to the Gentlemen of Scotland." In this pamphlet he predicts that, " instead of studying sobriety of manners, piety, diligence, or literature, one or other of which qualities are now necessary to recommend {67} the candidates to the favor of heritors, elders or presbytery, the candidate's sole study will be to stand right in politics, to make his zeal for the <ministry of state> conspicuous; or by all servile compliance with the humor of some great lord who has many churches in his gift, whether that humor be virtuous or vicious, to secure a presentation." He fears the mischiefs of patronage were but beginning to appear, and that gentlemen's sons will no longer devote themselves to the ministerial office, which will be sought by lads of mean parentage and circumstances. It is quite certain that, owing to the law of patronage, combined with the smallness of the livings, estimated by Hutcheson as at that time about L80 a year, and the influence of London court life, the upper classes (from which so many ministers had sprung in the previous century) ceased from this time to encourage their sons to enter the sacred office.

The recorded incidents of his person and family life are not numerous. He seems to have been engrossed in lecturing to his students, in managing college matters, and in preparing text-books. He published a "Compend of Logic," a "Synopsis of Metaphysics," and "Institutes of Philosophy," all in clear and graceful Latin (referred to with commendation by Dr. Parr in his " Spital Sermon "). He joined Dr. Moor in publishing a translation of the " Meditations " of Antoninus, with a life of Antoninus, an introduction and notes in English, the last showing a considerable acquaintance with the Stoic philosophy.

When in Dublin, he had married Mary Wilson, daughter of Francis Wilson, a gentleman of property, and belonging to a Presbyterian family in Longford.' In a letter to a friend, Feb. 12, 1740, he speaks of himself as " having been married now fifteen years and having only one boy surviving, of seven children borne to me by a very agreeable woman. I bless God for the one he has spared to me, and that he has no bad genius. If he proves a wise and good man, I am very well in this world. Since my settlement in this college I have had an agreeable and I hope not an useless life, pretty much hurried with study and business, but such as is not

unpleasant. I hope I am contributing to promote the more moderate and charitable sentiments in religious matters in this country, where yet there remains too much warmth, and commonly about matters of no great consequence to real religion. We must make allowance {68} for the power of education in all places, and have indulgence to the weakness of our brethren."[17]

So early, as June, 1741, he writes to his Belfast friend: " In short, Tom, I find old age, not in gray hairs and other trifles, but in an incapacity of mind for such close thinking and composition as I once had, and have pretty much dropped the thoughts of some great designs I had once sketched out." On April 3, 1745, he was nominated to the chair of moral philosophy in Edinburgh by the Town Council, but declined the honor, in consequence of not feeling strong enough to engage in new labors. He writes, April 16, 1746: "I am in a great deal of private distresses about Jo. Wilson and his sister, the latter in the utmost danger, the other scarce recovered from death; my wife, too, very tender; but, by a set of most intricate business, upon which the soul of this college depends, and all may be ruined by the want of one vote, I cannot leave this till after 26th June, and we go to Dublin first." He had been for some months in an uncertain state of health: he went to Dublin about the time mentioned in the letter quoted; and there, after a few days' fever, he was cut off, Aug. 8, 1746. His remains were buried in the old graveyard of Knockmark, East Meath, among his wife's kindred, the Wilsons and Stanhopes. He left one son, who became a physician, and rose to be professor of chemistry in Dublin College. That son published, in 1754, his "System of Moral Philosophy," to which is prefixed an account of the father's life by Dr. Leechman.

Hutcheson has nowhere explained very fully or formally the method on which he proceeds. But he everywhere appeals to facts; he brings all theories to the test of the actual operations of the human mind as disclosed to consciousness (a word frequently employed by him); he sets no value on speculations built up in any other way; and he everywhere speaks doubtfully or disparagingly of the logical distinctions and verbal subtleties of the schoolmen, and of the rational deductions of Descartes and Samuel Clarke. Proceeding on the method of observation, he discovers certain cognitive powers, which he {69} calls, perhaps unhappily, senses, which have a place in our very nature and constitution, and operate independent of any notice we may take of them. These features show that he belongs to the Scottish school, of which he is entitled to be regarded ,is the founder, inasmuch as no philosopher connected with North Britain had previously combined these characters, and as lie in fact gave the modern stimulus to philosophic speculation in Scotland.

He does not dwell at great length, nor very minutely, on the intellectual powers. He says that "late inquiries have been very much employed about our understanding. and the several methods of obtaining truth and so he would rather investigate " the various pleasures which human

nature is capable of receiving," and our various internal senses, perceptions, and affections, specially the sense of beauty and the moral sense. Still he intimates very clearly what views he takes of man's intellectual nature. And first, as to the senses, he says, " It is not easy to divide distinctly our several sensations into classes. The division of our external senses into the five common classes seems very imperfect. Some sensations received without any previous idea, can either be reduced to none of them, such as the sensations of hunger, thirst, weariness, sickness; or, if we reduce them to the sense of feeling,, they are perceptions as different from the other ideas of touch, such as cold, heat, hardness, softness, as the ideas of taste or smell. Others have hinted at an external sense different from all of these. The following general account may possibly be useful: (1) That certain motions raised in our bodies are by a general law constituted the occasion of perceptions in the mind. (2) These perceptions never come alone, but have some other perceptions joined with them. Thus every sensation is accompanied with the idea of duration, and yet duration is not a sensible idea, since it also accompanies ideas of internal consciousness or reflection; so the idea of number may accompany any sensible ideas, and yet may also accompany any other ideas as well as external senses. Brutes, when several objects are before them, have probably all the proper ideas of sight which we have without the idea of number. (3) Some ideas are found accompanying the most different sensations, which yet are not to be perceived separately from some sensible quality, {70} such as extension, figure, motion, and rest, accompany the ideas of sight or colors, and yet may be perceived without them, as in the ideas of touch, at least if we move our organs along the parts of the body touched. Extension, figure, motion, or rest, seem therefore to be more properly called ideas accompanying the sensations of sight and touch than the sensations of either of these senses, since they can be received sometimes without the ideas of color, and sometimes without those of touching, though never without the one or other. The perceptions which are purely sensible, received each by its proper sense, are tastes, smells, colors, sound, cold, heat, &c. The universal concomitant ideas which may attend any idea whatsoever are duration and number. The ideas which accompany the most different sensations are extension, figure, motion, rest. These all arise without any previous ideas assembled or compared g, the concomitant ideas are reputed images of something external. From all these we may justly distinguish those pleasures perceived upon the previous reception and comparison of various sensible perceptions with their concomitant ideas, or intellectual ideas, when we find uniformity or resemblance among them. These are meant by the perceptions of the internal sense." ("Nature and Con duct of the Passions," Sect. I.)

This note comprises the result and the sum of much reading and much reflection. The principal thoughts, more especially as to the separation of the ideas of number and duration, and of extension, figure, motion, and rest from our common sensations, are taken, directly or indirectly, from Aristotle's " Psyche," B. II. c. vi. (which is not referred to, however), where there is a distinction drawn

between common and proper percepts. But he seems to take a step beyond Aristotle when he tells us here, and still more expressly in his " Logic," that number and duration can be perceived both by the external and internal sense. It has been felt by all profound thinkers, that in order to account for the phenomena, and to save the senses from deceiving us, there must be distinctions of some sort drawn between different kinds of sensations or perceptions. Adopting the distinction of Aristotle, we find him in his " Logic " identifying it with that of Locke, between the primary and secondary qualities of bodies. It may be doubted whether we can so {71} absolutely divide, as Aristotle and Hutcheson did, the accompanying ideas from the sensations or perceptions. The sensations and ideas are in every case wrapped up in one concrete cognitive act, while, however, the may come tip in a different t, y concretion in our next experience, and may be separated into elements by an analytic process. I rather think, too, that the perception of extension (as has been shown by Hamilton) is involved in all our sense-perceptions, for we seem to know our organism as in space and localized by every one of the senses. The language about the motions of bodies constituting the <occasion> of the perceptions in the mind, proceeds upon the inadequate distinction between efficient and occasional cause, drawn by the disciples of Descartes, -- a distinction adopted by Reid as well as Hutcheson. I suspect that it still remains true, that the common division of our external senses is very imperfect, and that it is not easy to arrange our sensations into classes.

In regard to the question started in the next age by Reid, as to whether we perceive by the senses the external object, or an idea of it, it is certain that he accepts the view and the language of the great body of philosophers prior to his time, and he speaks of our perceiving by ideas " as images of something external."

Formal logic has been taught, I believe, in Glasgow University from its establishment in 1451 to this present time. Hutcheson has a "Logical Compendium" which was used as a text-book in Glasgow and elsewhere. In this treatise, after a meagre dissertation on the rise of philosophy, he defines logic as " the art of guiding the mind in the knowledge of things; adding, that it may also be considered a science, and that others define it " the art of discovering and declaring truth." These definitions will be regarded as too loose and vague by the rigid logicians of our time. In treating of the concept, notion, or idea, he represents ideas as being divided into sensations, imaginations, and pure intellections, -- a theory adopted by Gassendi, and favorably received by not a few for an age or two after the time of Descartes and Gassendi, as seeming to reconcile these two eminent men. Hutcheson had previously represented all sensation as external and internal, and declared, with Locke, that all our ideas arise either from the external sense or {72} from reflection. The intellections he defines as " any ideas not reached or comprehended by any bodily sense; " they are chiefly " suggested by the internal sense, and include our actions, passions, judgments, doubts, and the like, and also abstract ideas." There is an incongruous mixture here of the Lockian

with an older theory. The ideas derived from reflection, which are all singular and concrete, should not be put in the same class with those abstract and general ideas which are formed by the intellect from the materials got from sensation and reflection, and, we may add, from those furnished by the faculties of the mind in their exercise, such as those we have of the beautiful and the good. This confusion long lingered in the Scottish psychology from which it has scarcely yet been expelled.

Hutcheson represents complex (concrete would be the better phrase) ideas as having comprehension, and universal ideas as having extension; and announces the rule that extension and comprehension stand to each other in a reverse order. He distinguishes between a logical whole, which is a universal in respect of its species, which are spread out in division; and a metaphysical whole, which is the comprehension of a complex idea, and is declared by definition. He distinguishes between noetic and dianoetic judgment, in the former of which the two ideas are compared immediately (<proxime>), and in the latter by means of a third. The subject, predicate, and copula are said to be in the proposition either expressed or suppressed and involved. He does give the dictum of Aristotle as the regulating principle of reasoning, but derives all the force of syllogism from these three axioms, in which, we think, there is a very unsatisfactory vagueness in the phrase <agree>: " (1) Things which agree in one third agree with one another; (2) Things of which the one agrees and the other does not agree with one and the same third do not agree with one another; (3) Things which agree in no third do not agree with each other; (4) Things which disagree in no third do not disagree among them selves. Hence are deduced the general rules of syllogisms." This "Compend" continued to be printed and used down to at least the close of the third quarter of the eighteenth century. One is inclined to think that these phrases and distinctions must have been introduced to the notice, and inscribed on the {73} memory, of William Hamilton during his collegiate life at Glasgow, and that they may have helped as they recurred, consciously or unconsciously, to suggest to him certain of the essential principles of the "New Analytic of Logical Forms."

He has a separate treatise on metaphysics ("Metaphysical Synopsis," 1742) which he divides into ontology, or the science of being, and pneumatology, or the science of spirit (divine and human). " It appears from his treatise on metaphysics," says his admiring biographer, " that he was well acquainted with the logomachies, meaningless questions, and trivial debates of the old scholastics, which had thrown a thick darkness on that part of philosophy: he has set that branch of knowledge in a clear light, and rendered it instructive and entertaining." The sneer at the scholastics is a symptom of the age. The alleged " meaningless questions " are still put, and must be put, by profound thinkers who would go down to the foundations of truth. Even Hutcheson was obliged to put them and to answer them. The answers which he gives, if not so profound in fact or in appearance as those given by the ancient Greek philosophers, by the scholastics, or by Descartes and Leibnitz, are always clear and sensible, and

often just and satisfactory. He discusses, and this by no means in a superficial manner, topics which the Scottish metaphysicians between him and Hamilton carefully avoided. His scholastic training at Killyleagh, and the spirit of the older teaching, had still a hold upon him for good.

He treats of being, declaring it to be undefinable, and showing that it involves existence and essence, and that potency and action are the principles of being. He refers the conviction of our identity of being to consciousness. As to the much agitated question of the principle of individuation he comes to the sound conclusion that it is to be ascribed to the nature of the thing existing.

He discusses the question whether metaphysical axioms are innate. He denies that they are innate in the sense of their being known or observed by the mind from its birth, and affirms that in their general form they are not reached till after many comparisons of singular ideas. He shows that the mind assents to them in their singular form, even when a sensible object is presented. He stands up for axioms, self-evident and immutable, {74} -- with him, as with Locke, self-evidence being their prominent feature and their mark but he also declares them to be eternal and unchangeable, -- the mind perceiving at once the agreement or disagreement of the subject or predicate. He denies that there is any principle entitled to be regarded as the first of all, and maintains that it is vain to seek any other criterion of truth than the faculty of reason itself, and the native power of the mind. These views are surely more profound than those of Locke, less extravagant than those of Descartes, Leibnitz, or Wolf (he refers to Wolf). They do not exhaust the subject; in particular, while he says truly (with Aristotle) that the singulars and the less general are first known, he does not enter on the question, which neither the Scottish nor any other metaphysicians have yet settled, of the relation of self-evident truths in their singular to their generalized form.

In regard to space and time, he avoids the extreme positions both of Clarke, who represents them as modes of the divine being, and of Leibnitz, who describes them as mere relations perceived by the mind. He represents them as things or realities, and declares modestly and truly that we are ignorant of the relation in which they stand towards the divine nature. These judicious views were followed by the Scottish metaphysicians generally down to the time of Hamilton.

This leads him into the investigation of the infinite. He regards the following propositions as probable: that it is scarcely possible that there should be a number of infinite things of the same kind , that the infinite, because it is infinite, cannot be greater; that infinites, so far as infinites, cannot be multiplied; nor can have any finite relation (<rationem>) to finite parts, although things by one reason infinite and by another finite may be divided and multiplied, if only there are other things of the same description. But after enunciating these bold propositions he cautiously adds that these questions may well be held to surpass human capacity.

He declares that, properly speaking, there is only one sort of cause, the efficient. He says that in the impulse and motion of bodies, and in the effort to change the idea in our minds, and to produce motions in our bodily members, we not only see change, but perceive some energy or efficacy. This view is not thoroughly carried out; it certainly is the truth so far as {75} it goes. He cautions us, in the very spirit of Reid, against dogmatizing too minutely as to the power of the mind over the body.

Substance is that which remains when the affections change. He agrees with Locke that the nature of substance is unknown, except that we have an obscure idea of something as the substratum of qualities. His views on this whole subject are meagre and unsatisfactory.

Still it is in the discussion of these questions that he passes beyond Shaftesbury, and shows the clearness, the judiciousness, and the independence of his thinking. I am not sure whether these metaphysical topics have been discussed in a profounder manner by any thinker of the Scottish school except Sir W. Hamilton; and he has not shown the same amount of speculative caution and good sense as Hutcheson.

But Hutcheson dwells far more on the motive and moral parts of man's nature than on logical and metaphysical subjects. We have seen that he brings in many other senses besides the external ones. He defines sense, " every determination of our minds to receive ideas independently on our will, and to have perceptions of pleasure and pain." The following is his classification of them: " (1) In the first class are the external senses, universally known. (2) In the second, the pleasant perceptions arising from regular harmonious uniform objects, as also from grandeur and novelty. These we may call, after Mr. Addison, the `pleasures of the imagination,' or we may call the power of receiving them an internal sense. Whoever dislikes this name may substitute another. (3) The next class of perceptions we may call a public sense; viz., our determination to be pleased with the happiness of others, and to be uneasy at their misery. This is found in some degree in all men, and was sometimes called [Greek term], or <sensus commnunis>, by the ancients; this inward pain or compassion cannot be called a sensation of sight. It solely arises from an opinion of misery felt by another, and not immediately from a visible form. The same form presented to the eye by the exactest painting, or the action of a player, gives no pain to those who remember that' there is no misery felt. When men by imagination conceive real pain felt by an actor, without recollecting that it is merely {76} feigned, or when they think of the real story represented, then, as there is a confused opinion of real misery, there is also pain in compassion. (4) The fourth class we may call the moral sense, by which we perceive virtue or vice in ourselves or others. This is plainly distinct from the former class of perceptions, since many are strongly affected with the fortunes of others who seldom reflect upon virtue or vice in themselves or others as an object; as we may find in natural affection, compassion, friendship, or even general

benevolence to mankind, which connect our happiness or pleasure with that of others, even when we are not reflecting upon our own temper, nor delighted with the perception of our own virtue. (5) The fifth class is a sense of honor which makes the approbation or gratitude of others, for any good actions we have done, the necessary occasion of pleasure, and then dislike, condemnation, or resentment of injuries done by us, the occasion of that uneasy sensation called shame, even when we fear no further evil from them." He adds that this enumeration may not be sufficient, and says that "there may be others, such as some ideas of decency, dignity, suitableness to human nature in certain actions and circumstances."

He then shows that the objects gratifying these senses call forth desires, which fall into five corresponding classes, those of the bodily senses, of the imagination or internal sense, of public happiness, of virtue, and honor. We are yet (so I am inclined to think) without a thoroughly exhaustive classification of the natural appetencies which lead to emotion, and desire, and action. That of Hutcheson is one of the best which we yet have, and should be looked to by those who would draw out a scheme of the categories of man's motive principles. I am disposed to think, however, that the sense of honor may be resolved into the moral sense combined with some other principles. (" Moral Philosophy," Book I.)

He shows how secondary grow upon these original desires. "Since we are capable of reflection, memory, observation, and reasoning about the distant tendencies of objects and actions, and not confined to things present, there must arise, in consequence of our <original desires, secondary desires> of every thing imagined useful to gratify any of the primary desires, and that {77} with strength proportioned to the several original desires and the imagined usefulness or necessity of the advantageous object. Thus, as soon as we come to apprehend the use Of wealth or power to gratify any of our original desires we must also desire them. Hence arises the universality of these desires of wealth and power, since they are the means of gratifying all other desires." Mackintosh says, " He seems to have been the first who entertained just nations of the formation of the secondary desires which had been overlooked by Butler." ("Passions," Sect. I. Mackintosh's " Diss.," Sect. V.)

He also shows how the association of ideas, which he characterizes as the "disposition in our nature to associate any ideas together for the future which once presented themselves jointly," has an influence upon our desires, primary and secondary, and specially on our sense of beauty. " Some objects which, of themselves, are indifferent to any sense, yet by reason of some additional grateful idea may become very desirable, or by like addition of an ungrateful idea ma raise the strongest aversion. When any circumstance, dress, state, posture, is constituted as a mark of infamy, it may become, in like manner, the object of aversion, though in itself most inoffensive to our senses. If a certain way of living, of receiving company, of showing courtesy, is once received among those who are honored, they who cannot bear the expense of all this may be made uneasy

at their condition, though much freer from trouble than that of higher stations. Thus dress, retinue, equipage, furniture, behavior, and diversions, are made matters of considerable importance by additional ideas." , The beauty of trees, their cool shades and their aptness to conceal from observation, have made groves and woods the usual retreat to those who love solitude, especially to the religious, the pensive, the melancholy, and the amorous. And do not we find that we have so joined the ideas of these dispositions of mind with those external objects, that they always recur to us along with them." He thus started those views regarding the influence of association of ideas on our perceptions of beauty and moral good which were prosecuted by Turnbull, Beattie, and others, till they culminated in the ingenious but extravagant theories of Alison and Jeffrey in regard to the beautiful, and of Adam Smith and Mackintosh as to virtue. Hutcheson certainly has not developed the full {78} influence of association of ideas, but the account which he gives is just, so far as it goes.[18]

He dwells at great length on the sense of beauty. The feeling is raised at once on the perception of certain objects. He does not stand up for beauty supposed to be in the nature of things without relation to any mind perceiving it. On the contrary, all beauty implies the perception of some mind. Still there may be a distinction drawn between original or absolute beauty on the one hand, and relative or comparative beauty on the other. By the former he understands the beauty which we perceive in objects without comparison with any thing external, such as that observed in the works of nature, artificial forms, figures, theorems; by the latter, the beauty founded on uniformity, or a kind of unity between the original and the copy. In determining what the beautiful is, he propounds the theory that it is a compound ratio of uniformity and variety, so that where the uniformity of bodies is equal, the beauty is as the variety; and where the variety is equal, the beauty is as the uniformity. He seeks to establish this view by examples, dwelling on beautiful objects in nature and art, showing how there is in all of them uniformity or unity, proportion or harmony. This doctrine may not be the full theory of beauty; but there must surely be some truth in it; for in some modification or other it has cast up among profound thinkers in all ages, from Plato and Augustine in ancient times, to Cousin, Macvicar, and Ruskin in our day.

He stands up resolutely for the existence of disinterested and social affections. He earnestly opposes those who, like the Cyrenaics, and probably the Epicureans, would make pleasure the end of existence, and who would make us desire the good of others or of societies merely as the means of our own safety and prosperity, or as the means of some subtler {79} pleasures of our own by sympathy with others in their happiness; or who would make our end to be the pleasure we enjoy in being honored, or some reward we expect for our services, and these either from God or man. He opposes also that more refined system which makes our aim the joys proceeding from generous motions and moral approbation. He shows, with great acuteness, that in all our desires, whether benevolent or selfish, there is some motive, some end intended distinct from the joy of success,

or the removal of the pain of desire; and that there is first the motive operating, and then the joy or pain following, according as the motive is gratified or thwarted. He proves that men have affections, such as the love of offspring and of relatives, which fit them for a state of society; he takes pains to show that in this respect he differs from Puffendorf, who constructs his theory of society on the principle that self-love is the spring of all our actions; and he offers a most determined opposition to Hobbes when he makes the natural state of man to be one of war.

A considerable portion of all his works is occupied in demonstrating that man is possessed of a moral sense. In his "Inquiry," published before Butler's "Sermons on Human Nature," he declares, " that from the very frame of our nature we are determined to perceive pleasure in the practice of virtue, and to approve of it when practised by ourselves or others." He declares that the vast diversity of moral principles in various ages and nations " is indeed a good argument against innate ideas or principles, but will not evidence mankind to be void of a moral sense to perceive virtue or vice in actions." He ever kindles into a gentle warmth when he speaks of the joys derived from this sense, which he represents as purer and more elevated than those which can be had from any other source. The conscience, though often unable to govern our inferior nature, is yet in its own nature born for government; it is the ruling principle ([Greek term]) to which all things had been subjected in the entire (<integro>) state of our nature, and to which they ought to be subjected. His views on the subject of the supremacy of conscience are not so thoroughly wrought out as those of Butler; but they are explicitly stated, and become more decisive in his later works.

But what is the quality in actions looked at, appreciated, and {80} approved by the moral sense? To this question Hutcheson gives, if not a satisfactory, a very decisive reply. He represents this quality as good-will or benevolence. " All those kind affections which incline us to make others happy, and all actions which flow from such affections, appear morally good, if while they are benevolent towards some persons they be not pernicious to others." Advancing, a step farther, he discovers that "the several affections which are approved, though in very different degrees, yet all agree in one general character of tendency to the happiness of others," and the most perfectly virtuous actions are such " as appear to have the most unlimited tendency to the greatest and most extensive happiness of all the rational agents to whom our influence can reach." He is evidently inclined to reckon the moral sense as planted in our nature to lead us to commend at once those actions which tend towards the general happiness. His theory of virtue thus comes to be an exalted kind of eudaimonism, with God giving us a moral sense to approve of the promotion of happiness without our discovering the consequences of actions. Hume required only to leave out the divine sanction (he retained some sort of moral sense) in order to reach his theory of virtue consisting in the useful and agreeable. Hutcheson opposes very resolutely all those moralists who seek to give morality a deeper foundation in

the nature of things. The function of reason in morals is simply to show what external actions are laudable or censurable, according as they evidence good or evil affections of soul.[19]

Proceeding on these principles, derived mainly from Shaftesbury, but more systematically expounded, he builds up a system of moral philosophy. He gives a division of the virtues, and treats of the duties we owe toward God, toward mankind, and toward ourselves. In proving the existence of God, he appeals to the structure of the world. He reaches the divine perfections by a set of metaphysical principles surreptitiously introduced, and scarcely consistent with his philosophy. {81} He answers the objections derived from the existence of evil in a commonplace way, by showing how particular evils are necessary to superior good. He seeks to establish the immortality of the soul by an appeal to the nature of the soul as being different from the body, and to the hopes of a future state.

He enters at great length into the discussion of the ages which preceded him, as to the law of nature. He shows that there are rights antecedent to the institution of civil government. He establishes the right of property, first, on the principle that " things fit for present use the first occupier should enjoy undisturbed; " and on the farther principle, that each has a right to the fruits of his own labor, and that it is the common interest of society, and tends towards the furtherance of industry, that mankind should be secured in their possessions.

He says that "civil power is most naturally founded by these three different acts of a whole people: (1) An agreement or contract of each one with all the rest, that they will unite into one society or body, to be governed in all their common interests by one council; (2) A decree or designation made by the whole people of the form or plan of power and of the persons to be intrusted with it; (3) A mutual agreement or contract between the governors thus constituted and the people, the former obliging themselves to a faithful administration of the powers vested in them for the common interest, and the latter obliging themselves to obedience. Though it is not probable that, in the constitution of the several states, men have generally taken these three regular steps; yet it is plain that, in every just constitution of power, there is some such transaction as implicitly contains the whole force of all the three." He argues that the people have a right of resistance, and of dethroning a prince who is grossly perfidious to his trust.

He thinks that the senate of the country should create a censorial power, " that by it the manners of the people may be regulated, and luxury, voluptuous debauchery, and other private vices prevented or made infamous." He holds that the " magistrate should provide proper instruction for all, especially for young minds, about the existence, goodness, and providence of God, and all the social duties of life and motives {82} to them." But he particularly maintains that " every rational creature has a right to judge for itself in these matters." While an earnest supporter of liberty of thought and action, he yet holds "

as to those who support atheism, or deny a moral providence, or the obligation of the moral law, or social virtues, that the state may justly restrain them by force, as hurting,, it in its most important interests."

When Calamy heard of Hutcheson's call to Glasgow, he smiled, and said he was not for Scotland, and that he would be reckoned there as unorthodox as Simson. But Hutcheson lived an age later than Simson; he was much more prudent, and was personally liked; he was professor of philosophy and not of theology; and so he passed through life with very little public opposition. Still the stone which he had set a-moving could not go on without meeting with some little ruffling. About the beginning of the session 1737-38, a paper was printed and published anonymously by one who professed to have been lately in the college, charging Hutcheson with teaching dangerous views. I have not seen this attack; but the reply prepared by a body of his favorite students is preserved. There seems to be force in some of the objections taken; others entirely fail. It is objected to him that he taught that we could have the knowledge of moral good and evil, although we knew nothing of the being of a God; it is replied that Hutcheson's doctrine was that we might have knowledge of some virtues, though we had not known God, and that a notion of moral good must come prior to any notion of the will or law of God. It is objected that he taught that the tendency to promote the happiness of others is the standard of moral goodness; it is acknowledged in the answer that benevolent affections towards others are our primary notion of moral goodness, and the primary object of our approbation. It is objected that he taught that it is sometimes lawful to tell a lie; it is answered that Hutcheson's doctrine was very much against lying, but did imply that there might be cases in which lying was justifiable.

Throughout Scotland there was an impression among the scholars who had been trained in the previous generation that he was sensualizing and degrading the old philosophy. The friends of evangelical truth perceived that the young preachers {83} who admired him addressed them in a very different speech from that of their old divines and from that of the inspired writers. The description given of the new style of preaching by the clerical satirist Witherspoon, in his " Characteristics," was found to have point and edge: " It is quite necessary in a moderate man, because his moderation teaches him, to avoid all the high flights of evangelic enthusiasm and the mysteries of grace of which the common people are so fond. It may be observed, nay, it is observed, that all our stamp avoid the word grace as much as possible, and have agreed to substitute the moral virtues' in the room of the `graces of the Spirit.' Where an old. preacher would have said a great decree of sanctification, a man of moderation and politeness will say a high pitch of virtue." In the advice to a good preacher the following counsels are given: "(1) His subjects must be confined to the social duties. (2) He must recommend them only from rational considerations; viz., the beauty and comely proportions of virtue, and its advantages in the present life, without any regard to a future state of more extended self-interest. (3) His authorities must be drawn from

heathen writers; none, or as few as possible, from Scripture. (4) He must be very unacceptable to the common people." " The scattering a few phrases in their sermons, as harmony, order, proportion, taste, sense of beauty, balance of the affections, will easily persuade the people that they are learned; and this persuasion is to all intents and purposes the same thing as if it were true. It is one of those deceitful feelings which Mr. Hg in his essays has shown to be beautiful and useful." In illustrating the third counsel he says: " It is well known there are multitudes in our island who reckon Socrates and Plato to have been much greater men than any of the apostles, although (as the moderate preacher I mentioned lately told his hearers) the apostle Paul had a university education and was instructed in logic by Gamaliel. Therefore let religion be constantly and uniformly called virtue, and let the heathen philosophers be set up as great patterns and promoters of it. Upon this head most particularly recommend M. Antoninus by name, because an eminent person of the moderate character says his `Meditations' are the best book that ever was written for forming the heart." The effect of this accommodation of religion to the {84} world is graphically and truly described: "The necessity of such a conduct cannot be denied when it is considered what effect the length and frequency of public devotion have had in driving most of the fashionable gentry from our churches altogether." "Now the only way to regain them to the church is to accommodate the worship as much as may be to their taste." "I confess there has sometimes been an ugly objection thrown up against this part of my argument; viz., that this desertion of public worship by those in high life seems, in fact, to be contemporary with, and to increase in a pretty exact proportion to, the attempts that have been made and are made to suit it to their taste."

Hutcheson's works got fit audience in his own day, but did not continue to be much read after his death. In his mode and manner of writing he is evidently indebted to the wits of Queen Anne, such as Shaftesbury, Bolingbroke, Pope, and Swift, who were Frenchifying the English tongue, polishing away at once its roughness and its vigor, introducing the French clearness of expression, and, we may add, the French morals. Hutcheson has their clearness, but is without their liveliness and wit. His style is like a well-fenced, level country, in which we weary walking for any length of time; it is not relished by those who prefer elevations and depressions, and is disliked by those who have a passion for mountains and passes. He ever maintains a high moral tone but it is doubtful whether he has retained for morality a sufficiently deep foundation.

His philosophy is undoubtedly an advance upon that of Locke, and rises immeasurably above that of those professed followers of Locke in England and France, who in the days of Hutcheson were leaving out Locke's reflection, and deriving all man's ideas from sensation, and all his motives from pleasures and pains. His view of the moral faculty is correct so far as it goes. He represents it as natural to man, and in his very constitution and nature. There may even be a propriety in calling it a <sense> with the qualifying phrase <moral>, inasmuch as, like the senses, it is a source

of knowledge, revealing to us certain qualities of voluntary acts or agents, and inasmuch as it has always feeling or sensibility attached to its exercises.

But, on the other hand, his view of the moral power falls greatly beneath that of the great English moralists of the previous century, and below that of the school of Clarke {85} in his own day. The word sense allies the conscience too much with the animal organism, and the whole account given of it separates it from the reason or higher intelligence. On this point he was met, immediately on the publication of his views, by Gilbert Burnet, who maintains that moral good and evil are discerned by reason; that there is first reason, or an internal sense of truth and falsehood, moral good and evil, right and wrong, which is accompanied by another succeeding internal sense of beauty and pleasure; and that reason is the judge of the goodness and badness of our affections and of the moral sense itself. Hutcheson does speak of the moral sense as being superior in its nature to the other senses, but he does not bring out so prominently and decisively as Butler did its supremacy and its right to govern.

If his theory of the moral power is superficial and defective, his account of that to which the conscience looks is positively erroneous. He represents virtue as consisting in benevolence, by which he means good-will. This view cannot be made to embrace love to God, except by stretching it so wide as to make it another doctrine altogether; for surely it is not as a mere exercise of good-will that to love God can be described as excellent. His theory is especially faulty in that it overlooks justice, which has ever been regarded by our higher moralists as among the most essential of the virtues. Nor is it to be omitted that his moral system is self-righteous in its injunctions, and pagan in its spirit. No doubt he speaks everywhere with deep admiration of the morality of the New Testament; but the precepts which he inculcates, are derived fully as much from Antoninus and the Stoics as from the discourses of our Lord, and the epistles of the apostles; and we look in vain for a recommendation of such graces as repentance and humility, meekness and long-suffering.

By bringing down morality from the height at which the great ethical writers, of ancient and modern times, had placed it, he prepared the way for the system of Adam Smith, and even for that of Hume. Smith was a pupil of his own, and Hutcheson was brought into contact with Hume. Hume submitted to Hutcheson in manuscript the " Third Part of his Treatise of Human Nature," that on morals, before giving it {86} to the world. The remarks which Hutcheson offered have been lost, but we can gather what they were from the letter which Hume sent him on receiving them, and which has been preserved. Hutcheson most characteristically objects to Hume, that he had not expressed a sufficient warmth in the cause of virtue, and that he was defective in point of prudence. Was this all that the high moralist Hutcheson had to object to the founder of modern utilitarianism? On the publication of his " Institutes of Moral Philosophy," Hutcheson sends a copy of it to Hume, who remarks upon it, specially objecting to it as adopting Butler's opinion, that

our moral sense has an authority distinct from its force and desirableness g, but confessing his delight " to see such just philosophy, and such instructive morals, to have once set their foot in the schools. I hope they will next get into the world, and then into the churches." Yes, this was what the rationalists wished in that day, and what they wish in ours, to get their views <into the churches>. Hutcheson, though disapproving of the philosophy of Hume, and refusing to support him as a candidate for the chair of moral philosophy in Edinburgh, which he himself declined, had not retained sufficiently deep principles to enable him successfully to resist the great sceptic who had now appeared. Error has been committed, God's law has been lowered, and the avenger has come.

VIII.-- RELIGIOUS CONFLICTS.-- RALPH ERSKINE.

W/E\ are now in the heart of the Scottish conflicts of the century. It is the crisis of the contest between Cavalier and Whig. On one point the philosophers and the evangelicals agree: they are defenders of the House of Hanover and opponents of the Pretender and the Stuarts, of whom they could not expect that they would be supporters of culture on the one hand, or of Protestantism on the other. The last formidable contest between Jacobite and Whig, was decided in behalf of the latter in 1746, at Culloden; and henceforth the former. is sinking into a state of complaining and garrulous, though often lively, old age. The religious conflicts are deeper, and continue for a longer period. From the time of Hutcheson, there is a felt and known feud, not always avowed, between the new philosophy and the old theology. It would have been greatly for the benefit of both, had there been one to reconcile and unite them. In the absence of such, each ran its own {87} course and did its own work, being good so far as it went, and evil only in its narrowness and exclusiveness, in what it overlooked or denied. The philosophers were laudably engaged when they were unfolding man's intellectual, esthetic, and moral nature; but they missed the deepest properties of human nature, when, in the fear of the ghosts of fanaticism, they took no notice of man's feelings of want, his sense of sin, and his longing after God and immortality; and the views of theologians would have been more just and profound, had they observed -- always in the inductive manner of the Scottish school -- those nascent ideas of good and evil and infinity which are at the basis of all religious knowledge and belief. The evangelical preachers were only faithful to their great Master when they declined to allow the doctrines of grace to sink out of sight; but they erred so far as they opposed the refinement and liberal sentiments which the moral philosophers were introducing, and showed that they were incapable of fully appreciating the apostolic command, "Whatsoever things are true, whatsoever things are honest, whatsoever things are just, whatsoever things are pure, whatsoever things are lovely, whatsoever things are of good report, if there be any virtue, and if there be any praise, think on these things." Pity it is that it should be so, but it is only by vibrations that the world moves on, only by breezes that its atmosphere is kept pure; and when the church errs by cowardice, it has to be rebuked by the unbelieving as -- an old Covenanter might have said -- the

father of the faithful was rebuked by a pagan Egyptian. It was only in a later age, and mainly through the influence of Chalmers, that the church was prepared heartily to accept what was true in the Scottish philosophy, and to acknowledge its compatibility with the doctrine of salvation by grace.

Three distinct religious parties are being formed in Scotland, not including the covenanting "remnant," who never submitted to the Revolution settlement, and whose vocation was on the mountains, rather than the colleges of their country. First, in the Church of Scotland there is the "Moderate" type of minister crystallized by coldness out of the floating elements. He is or be affects to be elegant and tolerant, and he is terribly afraid of a zealous religious life. He wishes to produce among the people a morality without religion, or at least without any of the peculiar dogmas of Christianity. As yet he himself is a moral man, and the people are moral, for they believe in the old theology; in the next age both pastors and people, retaining little faith, become considerably immoral, showing that, if we would have the fruit good, we must make the tree good. This party, preaching moral sermons without doctrine, is the genuine product of the Scottish philosophy in the Church of Scotland.

Secondly, the Evangelical party, called by their opponents `zealots' and `highflyers,' were placed in an ambiguous position and shorn of much of their strength since the enforcement of the law of patronage. They are fast becoming a minority, and a small minority, in the church; and they have to submit to much that they abhor, as, for example, to the settlement of pastors contrary to the will of the people. But they labor earnestly to keep alive the fire all through the dark and wild night; they cherish fellowship with other evangelical churches, and anticipate the missionary spirit of a later {88} age by countenancing the " Society for the Propagation of Christian Knowledge." They come into collision with the philosophic moralists by maintaining so resolutely the doctrines of grace; and they carry their antagonism to the " legal " system to the very verge of Antinomianism, as shown in their favor for the "Marrow of Divinity," this by a reaction prompting the moral divines to preach a morality without an atonement for immorality.

Thirdly, beyond the Established Church, the Seceding body, encompassed with hardships as fierce as the storms, but breathing a spirit as free as the air of their country, are rallying around them the old-fashioned and more determined religious life of Scotland. At this stage of its history it serves itself heir to the Covenants of the previous century, blames the Church of Scotland for being too indulgent, is intolerant of toleration, and has little sympathy with other churches. This body is beneath the notice of the philosophers; and in return it shows its utter distrust of them by declining to allow its students to attend the classes of moral philosophy, and appointing a professor of its own to give instruction in that branch, on which, as on other high departments of learning, it continued to set a high value. The event of that period which agitated lowland Scotland more than even the inroad of

the Pretender was the preaching of Whitefield, which moved the common people as the winds do the trees of the forest. The moderate party affected to despise and actually hated the preacher and his doctrine. The evangelicals in the Established Church rejoiced in his labors and their fruits. The seceders might have triumphed in his success; but they expected him to identify himself with their peculiar ecclesiastical constitution, and stand by them in the fight for the old cause of the Covenant. Upon Whitefield declining to do this, they became jealous of his influence, and were in doubts about the sound character of the revivals which he was the means of awakening. Out of this arose a very curious controversy, forgotten by all but a few antiquarians, but not unworthy of being noticed.

Mr. Robe, belonging to the evangelical party in the Church of Scotland, and a promoter of revivals and of the lively feeling manifested in them, declared that "our senses and imagination are greatly helpful to bring us to the knowledge of the divine nature and perfections; " and in defending this he asked: " Can you or any man else think upon Christ really as he is, God-man, without an imaginary idea of it?" To this Ralph Erskine, the seceder, replies in a treatise Of 372 closely printed pages, entitled " Faith no Fancy; or a Treatise of Mental Images, discovering the Vain Philosophy and Vile Divinity of a late Pamphlet entitled `Mr. Robe's Fourth Letter to Mr. Fisher,' and showing that an Imaginary Idea of Christ as Man (when supposed to belong to Saving Faith, whether in its Act or Object) imports nothing but Ignorance, Atheism, Idolatry, great Falsehood, or gross Delusion " (1745). He says of Mr. Robe: " This way of speaking appears indeed new and strange divinity to me, and makes the object of faith truly a sensible object; not the object of faith, but of sense." This leads him to criticise various philosophies. He refers to Tertuilian (as quoted by Jerome), who in regard to Platonic ideas said, " Haereticorum patriarchae philosophi." He shows him that the learned De Vries, Mastricht, and other eminent doctors {89} and divines abroad, had noticed how the ideal doctrine of Cartesius and his followers had led to imagery and idolatry. He also criticises Locke with considerable skill. "There seems nothing more common in the experience of mankind than that a man who hath the greatest stock of habitual knowledge and understanding relating to many truths, yet while his body sleeps, or his mind is in a muse about other things, lie perceives none of theme truths." So "I see no greater absurdity in saying one may leave a stock of seminal or habitual knowledge, though lie leave no actual knowledge, than to say one may have a stock of senses, though be hath no actual sensation, or consciousness of the acts or exercise of any of his senses, as a child not born or a man in a deep sleep; or a natural store of affections subjectively in him, and yet affected with nothing till occasions and objects appear. One may have a good pair of eyes, and yet see nothing till light be given and objects be presented. Nor is it an improper way of speaking to say a man hath not his eyes or sight, though he be not actually seeing. And as little is it improper to say a man hath understanding and knowledge, though he be not actually knowing or perceiving the truths he has the impress of in his understanding." This is a wonderfully clear statement of

the distinctions between the seminal capacity and the actual ideas, between a laid-up stock and occasions, by which philosophers have sought to overthrow the theory of Locke. In regard to the special question discussed, Mr. Robe had quoted the received rule, "<Oportet intelligentem phantasmata speculari>." Erskine quotes against him Hieroboord, " Mens non indiget semper phantasmata ad suas perceptiones." "The object of that idea is only corporeal things as corporeal; but the object of rational knowledge is not only corporeal things, but spiritual and corporeal things, not as corporeal, but as intelligible." " It is reason, and not sense, that is the only help to attain the natural knowledge of God and his perfections." Above reason he places faith. " True faith differs as much from, and is as far above, mere intellectual ideas as intellectual ideas are above corporeal and imaginary ideas; yea, much farther than human reason is above sense; even as far as what is above human and supernatural, is above merely natural." It is evident that there are curious questions started, though not precisely settled, as to the place which the phantasm has in thought, and the imagination in religion. We feel that we are in the society of men of reflection and of reading. The evangelical and the seceding ministers of these days are quite as erudite as the academic men who despised them, and are holding firmly by old truths which the new philosophy is overlooking.

IX.-- ARCHIBALD CAMPBELL.

H/E\ was a pupil of Professor Simson's, in Glasgow, and became minister of Tarbert in Stirlingshire. I have been able to collect few notices of him. He is worthy of being mentioned, as having had played upon him one of the basest tricks mentioned in literary history. He wrote a treatise on {90} "Moral Virtue," and sent it up to London to his friend, Alexander Innes, D.D., assistant at St. Margaret's, Westminster, to have it published; and Innes published it in his own name, with the date, Tothill Fields, Jan. 20, 1727-28. In 1730, Campbell went to London and exposed Innes's imposture. It seems that the Lord Chancellor, believing that Innes was the author of the work, presented him to a living. The Chancellor, being convinced of the deceit, sought to male amends by offering a living to Campbell, who declined the offer, saying that he preferred his own country; and he becomes professor of ecclesiastical history in St. Andrews. In 1733, he published the work in his own name, dating it St. Andrews, and disowning the " Prefatory Introduction " and " some little marginal notes of Innes." "An Inquiry into the Original of Moral Virtue, wherein is shown, against the Author of the Fable of the Bees, that Virtue is founded in the Nature of Things, is unalterable and eternal, and the great Means of Private and Public Happiness, with some Reflections on a late Book entitled `An Inquiry into the Original of our Ideas of Beauty and Virtue.' " Hutcheson, whom he thus assailed, spoke of him as no better than a disciple of Epicurus. His system is the boldest form of self-love. " Human nature is originally formed to pleasure and pain." " There is, indeed, a. distinction of goodness into natural and moral, but the latter as well as the former lies wholly in pleasure." 'God and all mankind are governed

by one common principle, viz., self-love." "They can favor or esteem no other beings but as they gratify this principle." " The affections and actions that correspond to the self-love of our own species are likewise agreeable to the self-love of the Deity." " From self-love we desire the love and esteem of other intelligent beings." There is a passage in which there is an anticipation of Smith's theory of sympathy: " Whatever tenderness we conceive in favor of other people, it comes from putting ourselves in their circumstances, and must therefore be resolved into self-love." He also wrote a treatise on the " Necessity of Revelation," 1739; and another, " Oratio de Vanitate Luminis Naturae." He thinks it impossible that man kind, left to themselves, should `discover' the great truths and articles of natural religion, or should be capable of giving a system to natural religion." He died in April, 1756. A posthumous work, " The Authenticity of the Gospel History," was published 1759. He was opposed by [Alexander Moncrieff].

X.-- ALEXANDER MONCRIEFF.[20]

A/LEXANDER\ M/ONCRIEFF\ Of Culfergie in the parish of Abernethy was educated at the grammar school of Perth and St. Andrews University, and became minister of his native parish. He was favorable to the Marrow school of divinity, and took part with the Erskines in defending the popular rights and in seceding from the Church of Scotland, being one of the four fathers of the secession. In 1724, he was made their professor of divinity. He {91} died in 1761. He wrote "An Inquiry into the Principle, Rule, and End of Moral Actions, wherein the Scheme of Selfish Love laid down by Mr. Archibald Campbell . . . is examined, and the received Doctrine vindicated." To quote the summary supplied by his biographers, he establishes the following propositions: " (1) To show that self-love is not, or ought not to be, the leading principle of moral virtue; (2) That self-interest or pleasure is not the only standard by which we can and should judge of the virtue of our own and others' actions, or that actions are not to be called virtuous on account of their correspondency to self-interest; (3) That self-love, as it exerts itself in the desire of universal, unlimited esteem, ought not to be the great remaining motive to virtuous actions," &c.

XI.-- RISE OF THE ABERDEEN BRANCH.

T/HE\ north-east of Scotland, -- embracing Aberdeen, Banff, Murray, Mearns, and a large portion of Angus, -- though now very much amalgamated with the rest of Scotland, had a character of its own in the seventeenth century. The people had a large Scandinavian element in their composition, had a shrill intonation, and a marked idiom, and a harder aspect (though probably with quite as much feeling within) than the people of the south and west. When Samuel Johnson lumbered through the region in 1773, and visited Lord Monboddo, he found it miserably bare of trees; but, had he travelled a century or two earlier, he would have had to pass through wide-spread forests. These were cut down in the seventeenth century; and in the stead of the

deer and wild animals a more industrious people substituted sheep and cattle, ranging over high mountains and large undulating plains, on which you would have seen patches of oats or bear here and there around the clay or turf dwellings of the tenants, but few fences or enclosures of any kind, except in the immediate neighborhood of the proprietors, whose castles and gardens, on the French model, relieved the wildness of the scene. On to the eighteenth century the rural population consisted of landlords, with rather small farmers absolutely dependent on them, and who paid their rent in the service, on certain occasions, of men and horses, and in such articles as oats, bear, mutton, salmon, geese, poultry, and peats. In these regions the peasantry had not been taught to think and act for themselves, as they had been in the south-west by the ploughing {92} up of the soil effected by the great covenanting movement. But in some of the towns, particularly in Aberdeen, which was looked up to as a capital by a considerably wide district, there was not a little refinement, which spread its influence over the landlords, the ministers of religion, and the other professional men: in particular, there had been in the city named a gifted painter, Jameson, a disciple of Rubens; and a very superior printer, Raban, who put in type the works of the Aberdeen doctors. The two universities, King's and Marischial's, trained and sent forth a large body of educated men, some of whom found their proper field on the Continent; while the great body of them remaining at home, were the special instruments-as teachers, clergymen, doctors, lawyers, or country gentlemen-of spreading a civilizing influence in these regions. For ten years after the Restoration, seventy students entered annually at King's, and a considerable number, though not so large, at Marischal some of these rose to eminence, and all of them helped to create a taste for learning and an appreciation for it, on the southern slope of the Grampians, and in the wide region lying north of that range of mountains, which was never crossed by the Roman legions, but was now conquered by the Roman literature.

The Calvinistic and covenanting principles which had determined the Scottish character in the south and west, and so far north as Fife, Perth, and some parts of Angus, had not generally permeated the region beyond. No doubt, the common people in the northern counties gladly listened to the evangelical preachers from the west, when they had the opportunity; and some of the covenanting ministers, banished in the times of persecution from their own people in the south, gathered around them in the places of their exile -- as Samuel Rutherford in Aberdeen, David Dickson in Turriff -- bodies of devoted adherents attached to the Presbyterian preaching and organization. Still these were as yet merely fermenting, but leavening, centres in the midst of influences which were resisting their extension. In the wide country held by the Gordon family, the Roman Catholic religion still held its sway. In the other parts, the landlords, the college regents, and the clergy were mostly Cavalier in politics and High Church in religion; and the mass of the people bad not learned to claim the prerogative {93} of thinking and acting for themselves. When a deputation from the General Assembly of the Presbyterian Church of Scotland-consisting of Alexander Henderson, Samuel

Rutherford, and Andrew Cant-went north to Aberdeen to proclaim the Covenant in 1638, they were met by "Replies and Duplies" on the part of the Aberdeen doctors, and the landlords discouraged their tenantry from following the new zeal imported from the south. The divines of Aberdeen, during that century, such as Baron and John Forbes (author of "Irenicum"), were adherents of Episcopacy; their studies were in the later fathers of the church, and their sympathies with the Laudean divines of England; and like them they wrote against Popery on the one hand, and Puritanism on the other. It was years after the Revolution before the Presbyterian Church could put its legal rights in execution in the north-east of Scotland. Almost all the old Presbyterian ministers had disappeared; and, in 1694, the Synod of Aberdeen consisted of six clerical members, most of them brought from the south. It was not till 1703 that John Willison was settled as first Presbyterian minister at Brechin in Angus; it was not till 1708 that he was in a position to dispense the sacrament of the Lord's Supper. When he intimated that he was to do so next Lord's day, Mr. Skinner, the Episcopalian minister who preached in the same church in the after part of the day, announced that he would dispense the communion on the same day in the afternoon to his supporters; and the ecclesiastical records report that 1500 communicated with Mr. Skinner. When Mr. Gray was appointed minister of Edzell, in the same district, the Presbytery had to conduct the services at his ordination in a neighboring parish; and they then passed into the parish to " lay hands on him " and return immediately; and, on the following sabbath when he rode to Edzell for the purpose of preaching, the people, hounded on by the landlords, took him off his horse, flung him into the West Water, and kept him there till he was nearly drowned, " to their eternal disgrace," as he causes it to be written in the parish records. During the Rebellion of 1715 the Presbyterian ministers were rabbled from their churches, which were occupied by the nonjuring clergy praying for the Pretender. A considerable body of the students in both the Aberdeen colleges sympathized {94} with the banished king; and, after the battle of Sheriffmuir, several of the professors had to retire in consequence of the part which they had taken against the government. It was not till after the suppression of the Rebellion of 1715,-indeed, not fully till after the crushing of the chieftain power after 1745,-that the north-east of Scotland became one with the south of Scotland in religion and in national feeling.

In the universities, both tinder Prelatic and Presbyterian domination, the philosophy taught had been to a great extent Aristotelian and scholastic. The university commissioners appointed, in 1643, a <cursus> for Aberdeen; and in it the student is required, after taking Greek the first year, to go on the second year to the dialectics of Ramus, to Aristotle's categories, interpretation, and prior analytics, and in the third year to the rest of logics and portions of the ethics of Aristotle, &c. In the " Metaphysics " of Robert Baron, who lectured in Marischal College in the first half of the seventeenth century, he treats of being, unity, and goodness; enters fully into the controversy between the Thomists and Scotists; gives the divisions of <ens> and of cause, and treats of necessity and

contingency, of sameness and diversity, of absolute and relative, of whole and parts. In the university library of Aberdeen we have theses occupying 121 pages by Andrew Cant, the younger, of date 1658; in these he shows that he knew the Copernican theory of the heavens and Harvey's discovery of the circulation of the blood: but the whole discussions are conducted in a formal manner; and he dwells fondly on the scholastic logic, in the treatment of which he shows some independence of thought. In 1710 there was published a work by Thomas Blackwell, who had come from Paisley, in 1700, to be minister at Aberdeen in the Presbyterian interest, and who was made professor in 1711, and principal in 1717: his work is entitled " Schema Sacrum, or a Sacred Scheme of Natural and Revealed Religion; " and in it the common orthodox theology is defended by the old distinctions, and there are no traces of a new spirit or a new school.

But, after the year 1715, Aberdeen was prepared for a new style of thought. The High Church theology was no longer encouraged, except among a scattered nonjuring clergy subjected to poverty and privation. The Calvinistic divinity had {95}never struck its roots deep into the soil; but the literature and physical science of England were known to and relished by the educated classes, and there must be a fresh philosophy to meet the awakened intelligence and new tastes of the country. The first to gratify this feeling was a young graduate of Edinburgh, appointed as one of the rectors in Marischal by the Crown, which had seized the patronage of the college, vacated by the attainder of Earl Marischal, who had been out in the rebellion.

XII. -- GEORGE TURNBULL.[21]

T/HE\ celebrated Hogarth, in his "Beer Street," has a graphic picture of a porter drinking barley wine, after depositing on the ground a load, directed to the trunk-maker, of five enormous folios; one of which has on the back, "Turnbull on Ancient Paintings." Turnbull was one of the most voluminous writers of his age. I have read many thousand pages written by him; but I fear the greater part of the copies of his works have gone to the destiny indicated by Hogarth. It is disappointing to find that this author, who was both an able and a graceful writer, has passed away from the public view so effectively that it is difficult now to procure materials for his biography, or even to get a sight of most of his works. It may be doubted whether any one, except the writer of this history, has been at pains to peruse his works as a whole, for the last hundred years. Dugald Stewart, so well informed on British philosophy, had only looked into one of his volumes; and Sir William Hamilton, in his multifarious researches among obscure writers, does not seem to have thought it worth his while making any inquiries about him. Yet it can be shown that he exercised a greater influence than all other masters and writers put together on his pupil Thomas Reid,-the true representative of the Scottish philosophy. He seems to have been the son of the Rev. George Turnbull (his mother's name was Elizabeth Glass), of whom we {96} can gather a few scattered notices: as that he was born about 1656; that he

graduated in Edinburgh University in 1675; that he became minister of Alloa in 1689, when the Episcopal clergyman was ejected; that he was translated to Tyningham in 1699; that he was nominated but not carried as moderator of the General Assembly in 1711; that he preached before that body in 1713; that his name appears among the members of "The Society for Propagating Christian Knowledge," in 1720 and that he died in June, 1744, at the age of eighty-eight. His son was born in 1698 (he was baptized July 15) graduated in Edinburgh in April, 1721 and in November of the same year he was appointed, by a presentation from the Crown, regent of Marischal College; and is taken on trial in philosophy and the Greek Language, and declares his willingness to sign the Confession of Faith. He comes to have among his colleagues Thomas Blackwell, son of the principal, admitted regent in 1723, who did much to create a taste for Greek in the college, and who is still known to antiquarian scholars by his learned but uninteresting works, "Inquiry into the Life and Writings of Homer," "Letters concerning Mythology," and " Memoirs of the Court of Augustus." In Aberdeen at that time there was-as we have seen there was in Glasgow-- a principal's party and an opposition party; and there were disputes about the election of the rector. The majority of the masters, including Mr. Turnbull, in opposition to the principal, Blackwell the elder, wish the society to make up a list of persons recommended for the office of rector, to be submitted to the procurators chosen by the students in their nations; and, upon the principal refusing, they elect a preses in his room, and choose a rector, who holds a court and summons the principal to appear before them; but they are stayed in their career by a suit from " the Lords of Council and Session." On April 14, 1726, he has carried a batch of thirty-nine students through a course of philosophy on to graduation; and the last name on the list is Thomas Reid. As having to preside on this occasion, he prepares a thesis, afterwards published, to be discussed by the candidates, -- "De Pulcherrima Mundi Materialis turn Rationalis Constitutione," -- in which the new physics are employed to furnish proofs of the existence of God, and in which he declares that natural science (physiology) is to be taught before moral philosophy, and inclines to censure Socrates because {97} he discouraged inquiries into the structure of nature. He also printed, when at Aberdeen, a " Thesis on the Connection of Natural and Moral Philosophy." In his lectures on pneumatology he delivered to his students those views which, after being rewritten, were given to the world in his treatise on moral philosophy. In his later writings he frequently quotes Hutcheson and Butler; but his own philosophic opinions seem to have been formed, and delivered in lectures, before either of these influential writers had published any of their works.

In 1726, he published "A Philosophical Inquiry concerning the Connection between the Doctrines and Miracles of Jesus Christ." In it he treats of subjects in which there is a revived interest and which are anxiously discussed in our day, and advances principles which would be favorably received by many in these times. He argues that the works of Jesus were natural proper samples of his doctrines. That he had abandoned the old theology of Scotland is evident, from his declaring that the Scripture way of talking about the

Spirit of God and his operations means simply assistance to the virtuous. It is interesting to notice, that in this treatise he refers once and again to common-sense as settling certain moral questions; in this, as in other matters, anticipating and probably guiding Dr. Reid.

In the spring of 1727, Turnbull resigned his office in Marischal College; and for the next twelve years we have little record of him. There is reason to believe that he became a travelling tutor, -- it is said, to the family of the Wauchopes, of Niddry, near Edinburgh. It is certain that he must have travelled extensively on the Continent, and made himself conversant with the treasures of art in Italy. In 1732, he received the honorary degree of doctor of laws from the University of Edinburgh. He seems to have mingled in the literary circles of London,'[22] and acquired friends among persons of eminence. During these years he prepared an immense store of literary works, which were issued in rapid succession, -- more rapidly, I suspect, than the public were prepared to receive them. In {98} October, 1739, he advertises, at four guineas, in sheets, his " Treatise on Ancient Painting;" in which he has observations on the rise, progress, and decline of that art among the Greeks and Romans, comments on the genius of Raphael, Michael Angelo, Nicholas Poussin, and others, and illustrates the work will) engravings of fifty pieces of ancient painting. It will be remembered that Shaftesbury had " Disquisitions on Taste;" and we shall see most of the Scottish metaphysicians speculate on taste and beauty. The work was not of such an original or daring character as to recommend it to the genius of Hogarth; yet it seems to have had a considerable roll of subscribers. " is style is pleasant, and the remarks judicious and highly appreciative of the classical painters. In February, 1740, there appeared his most important work, and the only one that continues to be read, "The Principles of Moral Philosophy." At the close he promises, as soon as his health admits, a work on " Christian Philosophy," which was actually published before the close of the year; and in it he treats of the Christian doctrines concerning God, providence, virtue, and a future state, and recommends the Word of God because it embraces and illustrates such doctrines. He dates October, 1740, a preface and appendix to Heineccius's " Methodical System of Universal Law."[23] In 1742, he published " Observations upon Liberal Education; and in it he speaks as having long been engaged in the work of education. He subscribes himself as Chaplain to the Prince of Wales, and dedicates the treatise to the " Right Reverend Father in God," Thomas, Lord Bishop of Derry; in whose esteem, he says, " he had long had a share."[24] It appears that before {99}this time be had left the communion of the Presbyterian Church of Scotland, and entered into orders in the Episcopal Church of England, which was doubtless more congenial to his tastes. Through the bishop, to whom he dedicated his work, he was appointed Rector of Drumachose, in the diocese of Derry. I cannot find that he left any mark behind him in that parish: there is no remembrance of him in the popular tradition of the district, and no record of him in the diocese. In consequence of failing health, he went to the Continent, and died at the Hague, Jan. 31, 1748.[25]

Turnbull was the first metaphysician of the Scottish -- I believe of any -- school to announce unambiguously and categorically that we ought to proceed in the method of induction in investigating the human mind. He takes as the motto of his " Moral Philosophy " the passage from Newton about the method of natural philosophy being applicable to moral subjects, and the line of Pope, " Account for moral as for natural things." His enunciations on this subject are as clear and decided as those of Reid and Stewart in after ages. "If a fact be certain, there is no reasoning against it; but every reasoning, however specious it may be, -- or rather however subtle and confounding, -- if it be repugnant to fact, must be sophistical." It must have been from Turnbull that Reid learned, even as it was from Reid that Stewart learned, to appeal to common language as built on fact or universal feeling. "Language not being invented by philosophers, but contrived to express common sentiments or what every one perceives, we may be morally sure that where universally all languages make a distinction there is really in nature a difference." Reid only catches the spirit of his old master, who speaks of " philosophers who, seeking the knowledge of human nature not from experience, but from I know not what subtle theories of their own invention, depart from common language, and therefore are {100} not understood by others, and sadly perplex and involve them selves." In some respects, his exposition of the method is more comprehensive and correct (so I believe) than that given by Reid and Stewart; inasmuch as he avows distinctly that, having got facts and ideas from experience, we may reason deductively from them, in what Mr. J. S. Mill calls the deductive method, but which is in fact a joint inductive and deductive method. He sees clearly that in natural philosophy there is a mixture of experiments with reasonings from experiments; and he asserts that reasonings from experiments may have the same relation to moral philosophy that mathematical truths have to natural philosophy. " In both cases equally, as soon as certain powers or laws of nature are inferred from experience, we may consider them, reason about them, and compare them with other properties, powers, or laws." He instances among the moral ideas which we may compare, and from which we may draw deductions, those of intelligence, volition, affection, and habit. Moral philosophy is described by him as a mixed science of observations, and reasoning from principles known by experience to take place in or to belong, to human nature. In his preface to Heineccius, he says that the appended " discourse upon the nature and origin of laws is an attempt to introduce the experimental way of reasoning into morals, or to deduce human duties from internal principles and dispositions in the human mind." In following this method, he claims to be superior to Puffendorf, to Grotius, and the older jurists.

Proceeding in this method he discovers, both in matter and mind, an established order and excellent general laws, and on this subject quotes largely from his contemporaries Berkeley and Pope. He constantly appeals to these laws as illustrating the divine wisdom; and to the excellence of laws as justifying the divine procedure, despite certain incidental acts which may flow from them. As inquirers discover these laws, science is advanced; and he dwells as

fondly on the progressiveness of knowledge as Bacon had done and as Stewart has done.

In particular, he shows that if we look at human nature as a whole, and at its several parts, we shall find beneficent general laws. He discovers in our constitution means to moral ends, and the science of these means and ends is properly {101} called moral philosophy. He shows that by such a study we can discover what are natural laws; and that, in all well-regulated states, the sum and substance of what is called its civil laws are really laws of natural and universal obligation adding that "civil law adopts only those laws of nature on which the quiet of mankind entirely depends, and that there are other duties to which men must attend out of reverence to their Creator and sincere love to mankind, without regard to the fear of human penalties." He shows that mankind are not left indifferent to virtue and to beauty: "As we are capable of distinguishing truth from falsehood, so we are capable of distinguishing good and approvable actions, affections, and characters, from bad and disapprovable ones." He would call this capacity moral sense, moral taste, moral discernment, or moral conscience. Like Shaftesbury (" who must live forever in the esteem of all who delight in moral inquiries"), and Hutcheson, whom he often approvingly quotes, he represents the virtues as capable of being reduced into benevolence.

In unfolding the elements of human nature, he dwells with evident fondness on the "association of ideas." He does not seem to attempt an ultimate resolution of the laws; but he considers association as "a league or cohesion formed by frequent conjunction in the mind," and says that "any appearance immediately suggests its concomitants and consequents to us." He adds, that association is more easily engendered between ideas that have some affinity or likeness." It may be doubted whether we have a better account at this day of the law of association as a whole. In regard to what Brown calls " secondary laws," and Hamilton the " law of preference," he prescribes two rules from Cicero for helping the memory: one is to attend to the things we would wish to recall; and the other is to consider its analogies, relations, and oppositions to other objects which will thus call it up. He accounts (as Stewart does) by the association of ideas for the law of habit, which he represents as a " propension to do, and a facility and readiness in doing, what we have often done." He shows truly and ingeniously how association influences the senses, by connecting the qualities perceived by one sense with those perceived by the others (a subject much dwelt on in a later age {102} by Brown); and, in particular, how, according to the theory of Berkeley, it aids the eye in discovering distance, not itself an idea of sight. He shows how our ideas have other ideas so associated with them that they make one perception, and how difficult it is to separate ideas that have thus been associated, and to find out precisely and philosophically what is involved in any particular idea, and how apt we are in consequence to confound qualities that are different. He is particularly successful in showing that desires and volitions are prompted by associations. " Ideas, as often as they return, must excite certain affections; and the affections which

lead to action must, as often as they are revived, dispose and excite to act, or, in other words, produce will to act." He remarks that " very few, if any, of the ideas which excite our warmest and keenest affections are quite free from associated parts." He insists that " various associations must produce various tempers and dispositions of mind; since every idea, as often as it is repeated, must move the affection it naturally tends to excite, and ideas with their correspondent affections often returning must naturally form inclinations, propensions, and tempers." He would account in this way for much of our feeling of beauty, and for propensity to imitate passing into custom. His exposition of the association of ideas is more satisfactory and accurate than the one, so much commended, published by Hume at the same time; and is far more philosophical than that given by Reid, who, in this respect, fell behind his master. I jam acquainted with no exposition of this part of our constitution published prior to his time which seems to me so full and correct.

His ideas on education are liberal and advanced. He is opposed to corporal punishment, and declares that the grand aim of education should be to foster good habits. Giving a high place to the study of the mind, he maintains, as did all the great masters of the Aberdeen school who came after him, that mental science should not be taught to young men till their minds have been other-wise well furnished. He gives logic a somewhat large and wide field;, in this respect, too, like the Scottish metaphysicians who came after him. Its province is to " examine the power and faculties of our minds (favorite phrases of Reid's), their objects, and operations; to inquire {103} into the foundations, the causes of error, deceit, and false taste; and, for that effect, to compare the several arts and sciences with one another, and to observe how each of them may derive light and assistance from all the rest. Its business is to give a full view of the natural union, connection, and dependence of all the sciences." Like Reid, and Stewart after him, he sets a high value on the study of " the nature and degrees of moral, probable, or historical evidence," and complains that it is left out in the logical treatises. The teacher should aim to make his pupil look at things, instead of words. At the same time, he recommends the study of languages with the study of things employing language in an enlarged sense, as embracing the different methods of expressing, embellishing, or enforcing and recommending truth, such as oratory, poetry, design, sculpture, and painting. He complains that in education the arts of design are quite severed, not only from philosophy, but from classical studies. The object contemplated by him in his work on " Painting " was to bring these various branches into union: he thinks that paintings may teach moral philosophy. The essential elements of painting are represented by him as being truth, beauty, unity, greatness, and grace, in composition. He dwells fondly on the analogy between the sense of beauty and moral sense; and on the inseparable connection between beauty and truth. His works on " education " and on the fine arts are clear and judicious, written in a pleasant and equable, but at the same time a commonplace style; and they seem never to have attracted the attention which they deserved, and which would

have been freely given to works of greater pretension, eccentricity, or extravagance.

But, after all, we are most interested in noticing the points in which Turnbull seems to have influenced Reid. We have already had some of these before us. We have seen that Turnbull announces as clearly as Reid that the human mind is to be studied by careful observation. Both are averse to abstruse scholastic distinctions and recondite ratiocinations on moral subjects. Turnbull ever appeals, as Reid did after him, to consciousness as the instrument of observation. Both are fond of designating mental attributes by the terms ,powers " and "faculties." Both would give a wide, and I may add a loose, field to logic, and include in it the inquiry into the nature of probable evidence. {104} In proceeding in the way of observation, both discover natural laws or principles, and both call them by the name of " common-sense." " Common-sense is certainly sufficient to teach those who think of the matter with tolerable seriousness and attention, all the duties and offices of human life; all our obligations to God and our fellow-creatures; all that is morally fit and binding. And there is no need of words to prove that to be morally fit and obligatory, which common-sense and reason clearly show to be so." Reid holds that all active power implies mind. This was the expressed doctrine of Turnbull before him. " It is, therefore, will alone that produces both power and productive energy." " To speak of any other activity and power, is to Speak without any meaning at all; because experience, the only source of all our ideas (and of the materials of our knowledge), does not lead us to any other conception or idea of power." Nor should it be omitted that both -- in this respect, however, like all the other Scotch metaphysicians ever speak with profound reverence of Scripture; ever, however, dwelling most fondly on those doctrines of the word which are also truths of natural religion; such as the existence of God, the obligations of morality, and the immortality of the soul.

I have been at pains to trace these agreements, not with the view of depreciating the originality and still less the independence of Reid, who may have had some of these views suggested to him by his teacher, but who may have afterwards found them in other writers, and who no doubt thought them all for himself, and adopted them because they seemed to him to be sound.[26] We have seen that in one or two points, Reid fell behind his master, who had clearer apprehensions than his pupil of mingling deductive with inductive observation, and of the laws of the association of ideas. But in other and more important philosophic doctrines, Reid passed far beyond his teacher. Reid claims to be original in rejecting the ideal theory of sense perception; which had been the received one for two thousand years, which had been adopted by Locke, and pursued to its logical consequences by Berkeley. But Turn bull evidently adheres to the old view. " Properly speaking, what we call matter and space are but certain orders of sensible {105} ideas produced in us, according to established rules of nature, by some external cause; for when we speak of material effects and of space, we only mean, and can indeed only mean, certain sensible perceptions excited in our mind

according to a certain order, which are experienced to be absolutely inert and passive, and to have no productive force." He speaks of the "external material world " as unperceived by us, and in itself absolutely unperceivable, as all philosophers acknowledged When, in speaking of the material world, he says it may be called the "external cause or occasion of those sensible ideas, and their connections, which make to each of us what we call the sensible world," we see that this is the doctrine which Reid set aside g, and yet we may notice that the phrase " occasion " is used by Turnbull, as by Reid, to designate the relation of the external action to the internal perception. In another point, Reid made a more important advance upon Turnbull. Living at a later age, Reid had to meet the objections of the great modern revolutionist, and had in consequence to dive down into profounder depths of the human constitution. The scepticism of Hume brought out to view the superficialities of the philosophy of Shaftesbury, partly by following its principles to their legitimate consequences, but mainly by making all men feel that it is nothing wherewith to meet the assaults of the new and formidable enemy. Shaftesbury, Hutcheson, and Turnbull had all appealed to common-sense; but Reid behoved to take a deeper and more searching view of the principles which constitute common-sense, in order to meet the exigencies of the new era.

Turnbull's works had no great circulation in their own day, and they speedily disappeared from public view. It might have been different had he continued in Aberdeen, and gathered around him a body of young men ready to receive and to propagate the lessons he taught them. But he departed into other fields, -- into the literary circle of England, and a church which set more value on liturgy than on abstract doctrine, -- and there he met with few to appreciate his gifts. A Presbyterian Scot might have urged, with some plausibility, that his name has perished because he forsook the country and the church in which his philosophic labors would have been valued. It might even have been different, had he published his metaphysical {106} treatises a dozen of years earlier; for then they might have run their course with those of Hutcheson and Butler. But at the very time that Turnbull advertised his work on "Moral Philosophy," Hume published his "Treatise of Human Nature," which, as it forced its way to the front, required philosophy to deepen its foundations and give a new facing to its buttresses. Turnbull is remembered because he had, for three years, when he was himself a very young man, a diligent and thoughtful pupil, who in due time wrestled with the great sceptic, and is acknowledged by Scotland as the representative of its native philosophy.

XIII.-- DAVID FORDYCE. [27]

H/E\ was born in Aberdeen in 1711, entered Marischal College in 1742, and was drowned at sea, as he was returning from travel, in September, 1751. During that age and the next there was a strong disposition towards the study of mental philosophy. In 1748, R. Dodsley began the publication of the " Preceptor," in London, and Fordyce wrote the article on " Moral Philosophy." He was appointed professor

of moral philosophy in the college in which he bad been educated, in 1742. In 1745, he published " Dialogues concerning Education," a very pleasantly written book. He discusses the question whether nature or training does most, and inquires whether the Socratic method is fitted to bring forth what is in our nature. He dwells fondly, like most of the philosophers of the Scottish school, on the influence of the association of ideas. The religion he recommends was evidently the moderate type: " As the religion of Christ was designed as a plain, consistent rule of life, and not a system of abstracted reasonings and speculations, -- to influence the heart more than fill the head, -- I would endeavor above all things a high spirit of disinterested and extensive virtue." He was author also of an essay on "Action of the Pulpit." After his death there was published a work of his, " Theodorus, a Dialogue concerning the Art of Preaching," to which was added " A discourse on the Eloquence of the Pulpit, by James Fordyce." His " Elements of Moral Philosophy" was published in 1754. There is little that is original in his works, but much that is judicious and useful. It is evident that he was acquainted with the works of Butler and Hutcheson. " Moral philosophy contemplates human nature, its moral powers and connections, and deduces the laws of action." " Moral philosophy has this in common with natural {107} philosophy that it appeals to nature or to fact." He finds passions or affections, some private, some public, and above these; (1) reason or reflection; (2) conscience, by which we denominate some actions and principles of conduct honest and good, and others wrong, dishonest, or ill." " We came by the idea of moral obligation or duty in the same way as our other original and primary perceptions: we receive them from the Author of our nature." We employ reason in moral cases, in "examining the condition, relations, and other circumstances of the agent, and patient." " Therefore, when we use these terms, obligation, duty, ought, and the like, they stand for a simple idea." He opposes those who establish morals on the divine will, and those who place it in the natures and reasons, truths and fitnesses, of things."

XIV.-- WILLIAM DUNCAN.[28]

H/E\ was born in Aberdeen, July, 1717, and was the son of a respectable tradesman. He received his education partly at Aberdeen and partly at Foveran. He entered Marischal College in 1733, and took his degree in 1737. Originally, he was designed for the gospel ministry; but not finding an inclination for the work, he went, as so many Scottish youths have done in like circumstances, to London (in 1739), and devoted himself to literature; translating " Select Orations of Cicero " and " Caesar's Commentaries," which were long found useful by youths averse to turn over the leaves of a dictionary. He wrote for Dodsley's " Preceptor " the article on " Logic and this was afterwards published in a separate volume, and continued for an age or two to furnish, not very philosophical but very useful, instruction to Scottish and other youths. The work is partly psychological partly logical. In Book First he treats of the origin and division of ideas, and of language; in the Second, of judgment, self-evident and demonstrable; in the Third, of reasoning and demonstration; and in the Fourth, of

invention, science, and the parts, of knowledge. He was appointed professor of philosophy in Marischal College, May 18, 1752, and entered the professorship, Aug. 21, 1753. He was drowned when bathing, May, 1760.

XV.-- JOHN STEVENSON.[29]

F/ROM\ the date at which we have now arrived, we have a succession of distinguished men testifying to the benefit they received. from the instruction imparted in the departments of logic and moral philosophy in the Scotch colleges. As being among the eminently successful teachers of his age, we have to give a place to John Stevenson, professor of Logic or {108} "Rational and Instrumental philosophy" in the University of Edinburgh. Dugald Stewart says of him that to his ,valuable prelections, particularly to his illustrations of Aristotle's "Poetics," and of Longinus on the "Sublime," Dr. Robertson has been often heard to say, that lie considered himself as more deeply indebted than to any other circumstance in his academic studies." "I derived," says Dr. Somerville, "more substantial benefit from these exercises and lectures than from all the public classes I attended at the university." Similar testimony is borne by the famous leader of the evangelical party in the Church of Scotland, Dr. Erskine (see Life by Sir Henry W. Moncreiff). The course of instruction followed by Stevenson is given in the Scots Magazine, and is well worthy of being quoted as an exhibition of the highest style of education imparted in the age. He gives lectures upon "Heineccii Elementa Philosopliae Rationalis," and Wynne's abridgment of Locke's "Essay upon the Human Understanding: " in which he explains all the different forms of reasoning, the nature of certainty both mathematical and moral, with the different degrees of probability; and shows how the understanding is to be conducted in our inquiries after truth of all kinds. He likewise explains the fundamental rules to be observed in the interpretation of the texts of very ancient authors. He teaches metaphysics in lectures upon De Vries's "Ontologia," in which he explains the several terms and distinctions which frequently occur in the writings of the learned. He also lectures upon Longinus, in which he illustrates the several precepts of oratory given by Cicero and Quintilian; and also, upon Aristotle, in which he illustrates his rules by examples from ancient and modern poets, and explains the grounds of criticism in eloquence and poetry. He gives likewise a course upon "Heineccii Historia Philosophica," in which he gives an account of the most famous philosophers ancient and modern, and the several opinions by which the different sects were distinguished. Each of his students is required to make a discourse upon a subject assigned him, and to impugn and defend a thesis, for his improvement in the art of reasoning. These exercises are performed before the principal and some of the professors with open doors. The students met him two hours daily; one of them was devoted to lectures on logic, delivered in the Latin tongue. It is stated that the college opens about the 10th of October, and rises about the end of May. The shortening of the length of the session in the colleges of Scotland, in later years, has done much to lower the standard of attainment.

John Stevenson was appointed professor in Edinburgh, in 1730, and died Sept. 12th, 1775, in the eighty-first year of his age. It is mentioned to his credit, by Stewart, that at the age of seventy be gave a candid reception to the philosophy of Reid, which was subversive of the theories which he had taught for forty years; and that "his zeal for the advancement of knowledge prompted him, when his career was almost finished, to undertake the laborious task of new-modelling that useful compilation of elementary instruction to which a singular diffidence of his powers limited his literary exertions." (Stewart's " Life and Writings of Reid.") {109}

XVI.-- SIR JOHN PRINGLE.[30]

H/E\ was for a time " professor of pneumatology and ethical philosophy " in Edinburgh University. The pneumatics are divided into the following parts: (1) A physical inquiry into the nature of such subtle and material substances as are imperceptible to the senses, and known only front their operations; (2) The nature of immaterial substances connected with matter, in which is demonstrated, by natural evidence, the immortality of the human soul (3) The nature of immaterial created beings not connected with matter (4) Natural theology, or the existence and attributes of God demonstrated front the light of nature. Ethics or moral philosophy is divided into the theoretical and practical parts, in treating of which the authors lie chiefly uses are Cicero, Marcus Antoninus, Puffendorf, and Lord Bacon. He had lectures explaining the origin and principles of civil government, illustrated with an account of the rise and fall of the ancient governments of Greece and Rome, and a view of that form of government which took its rise from the irruptions of the northern nations. His students have also discourses presented to them upon some important heads of pneumatical or moral philosophy, which are delivered before the principal with open doors. Pringle was by no means so thorough an instructor as Stevenson. Carlyle describes him "as an agreeable lecturer, though no great master of the science he taught." " His lectures were chiefly a compilation from Lord Bacon's works, and had it not been for Puffendorf's small book, which he made his text, we should not have been instructed in the rudiments of the science." Nevertheless, we see that he discussed topics which must issue, sooner or later, in a scientific jurisprudence and political economy. We see, in the case both of Stevenson and Pringle, how much attention was paid in the Scottish universities to the practice of English composition.

Pringle's taste did not lie specially in metaphysics. He was born in Roxburghshire, in 1707, and became a physician. He settled in Edinburgh about 1734; and after 1748, resided in London, where be was elected president of the Royal Society in 1773. He died in 1782

XVII.-- THOMAS BOSTON.

W/E\ wish our readers to transport themselves to the eastern border country of Scotland, and to try to realize its condition in the first half of last century. People are

apt to take their views of that district from Sir Walter Scott, who passed the most interesting portion of his boyhood there, and picking up the dim traditions of the past ere they were finally lost, and tingeing them with the romantic hues of his own imagination, has presented to us such a picture as a man of the nineteenth century, in love with chivalry, would be {110} likely to furnish of the ages of border strife. But the truth is, Sir Walter has given us only one side of the Scottish character; he never thoroughly sympathized with the more earnest features of the national mind, and he did not appreciate the attempts which were made in the seventeenth century to deliver the country from violence and superstition, and to Promote education and a scriptural religion. The people of the eighteenth century had such traditions of the earlier ages as to be glad that the days of the border raids had passed away. At the time we wish to sketch, two classes of people were to be found in the district. There were landed prorietors, disposed to allow no opposition to their not very generous or enlightened will, but who were already catching the taste for improving the land, which has made Berwickshire one of the most advanced agricultural districts in the three kingdoms. Under them were small farmers and their servants, with the ignorance and much of the rudeness of the previous ages, and not yet awakened to independent thought and action. Between them there was scarcely any middle class, except the parish ministers, who, in the early part of the century, if not highly cultivated, were zealous preachers of the doctrines of grace, and actively seeking to raise their people to church-going habits and a decent morality; and who, at a later date, as patrons began to assert their legal rights, and colleges adopted the new philosophy, became the most vehement opponents of the evangelical party: so that, in the days of Carlyle, the Synod of Merse and Teviotdale turned the vote against popular rights, and the ministers of it, coming to the General Assembly, rushed to the theatre to hear Mrs. Siddons when she happened to be in Edinburgh. Believing that there was nothing suited to them in such a religion, the common people set up in the towns and large villages seceding congregations, which drew towards them the more earnest of the inhabitants. Out of one of these congregations sprang Thomas M'Crie, who has given us the other phase of the Scottish character.

At the beginning of the century, the most remarkable man in the district was undoubtedly Thomas Boston. Born at Dunse in the previous century, he remembered his going, when a boy, to the prison of his native place to keep his father company when lie was incarcerated for resisting the imposition of Prelacy. All his life he is most sedulous and consistent in discountenancing the system of church patronage, which is being steadily introduced. Settled as a minister first in Simprin, and then in Ettrick, he is consumingly earnest in visiting once a year, in catechising twice a year, and in preaching on Sabbath-day and week-day to, an ignorant and careless people just rising out of barbarism. But he contrived to retain a literary taste amidst his active parochial employments. With a difficulty in getting books, and rejoicing so when a good one came in his way, he was able, by his own independent study, to develop views in regard to the importance of Hebrew points

which were far in advance of those attained in his time by any British scholar. Endowed with a clear, logical mind, he has, in his " Fourfold State " and " Covenant of Grace," given us perhaps the best exposition we have of the old Scotch theology in its excellencies,-- some would add, in its exclusiveness. Living and breathing in the doctrine of free grace, he seized with avidity and valued excessively the " Marrow of Modern Divinity," {111} which he found in the cottage of one of his people, and he vigorously opposed the moral or legal preaching which was fast coming in with the new literature and philosophy. Singularly single-minded, earnest, and fervent in his piety, this man becomes a favorite and a power, first in his district, and, in the end, by his theological works all over Scotland. In reading his Memoirs, we observe that lie was painfully careful in watching his moods of mind, often referring to spiritual interposition what arose from wretched health; and that he was ever looking on events occurring in God's providence as <signs> indicating that he should pursue a particular line of conduct. It needed a philosophy -- we regret that it should have been an infidel one which did the work -- to correct these errors of a narrow theology.[31]

XVIII.-- DAVID DUDGEON.

A/LREADY\ the old orthodoxy was being troubled. Mr. David Dudgeon published, in 1732, a work entitled "The Moral World." We have no record of the early history of this man, and we do not know whether he received a college education. When he comes under our notice, he is tenant of a large farm called Lennel Hill, in the parish of Coldstream. In the work referred to he maintains, with clearness and ability, a doctrine like that of Anthony Collins, whom he had read. He asserts " that there is no evil in the moral world but what necessarily ariseth from the nature of imperfect creatures, who always pursue their good, but cannot but be liable to error or mistake," and that evil or sin is inseparable in some degree from all created beings, and most consistent with the designs of a perfect Creator." On account of the errors in this work, he was summoned before the Presbytery, where two charges are brought against him: 1st, That he denies and destroys all distinction and difference between moral good and evil, or else makes God the author of evil, and refers all evil to the imperfection of creatures; 2d, That he denies the punishment of another life, or that God punishes men for sin in this life, -- yea, that man is accountable. He appears before the court, and holds it to be contrary to Scripture that man has free-will in the Arminian sense, but holds that man is accountable and punishable for practising contrary to the divine precepts of our Saviour, the practice of which tends to make all men happy. The case goes up from presbytery to synod, and from synod to General Assembly, which remits it to the Commission of Assembly in 1733, again in 1734, again in 1735, and again in 1736, with no evidence that the commission ever ventured {112} to take it up.[32] In 1734, he published a vindication of the " Moral World," in reply to a pamphlet against him, said to be written by Andrew Baxter; and therein he maintains that when a rogue is hanged he is set free to enter a state where he may be reformed. His most important work is " Philosophical

Letters concerning the Being and Attributes of God," first printed in 1737. These letters were written, in the midst of pressing agricultural cares. to the Rev. Mr. Jackson, author of a work written in the spirit of Clarke, " The Existence and Unity of God." In these letters, Dudgeon reaches a species of refined Spinozism, mingled with Berkeleyanism. He denies the distinction of substances into spiritual and material, maintains that there is no substance distinct from God, and that "all our knowledge but of God is about ideas they exist only in the mind, and their essence and modes consist only in their being perceived." In 1739, he published a " Catechism founded upon Experience and Reason, collected by a Father for the use of his Children " and, in an introductory letter, lie wishes that natural religion alone was embraced by all men, and states that, though he believes there was an extraordinary man sent into our world seventeen hundred years ago to instruct mankind, yet he doubts whether he " ever commanded any of those things to be written concerning him which we have." The same year, he published " A View of the Necessitarian or Best Scheme, freed from the Objections of M. Crousaz, in his Examination of Pope's `Essay on Man.'"

Dudgeon died at Upsettlington, on the borders of England, January, 1743, at the age of thirty-seven. His works were published in a combined form in 1765, in a volume without a printer's name attached, showing, that there was not as yet thorough freedom of thought in Scotland. His writings had for a time a name in the district (the " Catechism " reached a third edition), but afterwards passed away completely from public notice. The late Principal Lee was most anxious to know more of his history, and in particular whether he could have influenced David Hume in personal intercourse or by his writings. As they lived in the same district, Hume must have heard of the case, which appeared when Hume was cogitating his own system. There are points in which Dudgeon anticipated Hume. Thus, Dudgeon maintains that all knowledge is about ideas, the essence of which is that they are perceived. He says that the words "just, unjust, desert &c., are necessarily relative to society; " and that if we allow that there is not justice in the government of this world, we cannot argue that there is justice in the world to come. Dudgeon, too, is a stern necessarian. But in all these points Dudgeon had himself been anticipated by others. In other respects the two widely differ. Dudgeon assumes throughout a much higher moral tone than Hume ever did. Dudgeon had evidently abandoned a belief in Christianity, but he stood up resolutely for a rational demonstration of the existence of God as the cause of the ideas which come under our experience; and he has a whole system of natural religion: whereas Hume undermines all religion, natural as well as revealed. {113} Dudgeon had superior philosophic abilities; and in other circumstances might have had a chance of becoming the head of a new philosophic Heresy. But there was a young man in his own neighborhood being trained to supersede and eclipse him in his own line, and to go beyond deism to atheism. It is thus that error advances till it corrects itself.

XIX.-- DAVID HUME.[33]

D/AVID\ H/UME\ was born at Edinburgh, on April 26, 1711. He was the second son of Joseph Home or Hume, of Ninewells, so called from a number of springs which may still be seen as fresh as when the name was given. The mansion is in the parish of Chirnside, in Berwickshire, and is situated on the green slope of a hill which rises from the river Whitadder, immediately in front. The situation is remarkably pleasant, and from the heights above there are extensive views of the whole eastern border country, now associated in the minds of all reading people with tales of romance. Here David Hume passed the greater portion of his younger years, and much of the quieter and more studious parts of his middle age. But he never refers to the scenes of his native place, not even (as Mr. Burton has remarked) when be has occasion in his History of England" to relate events which might have led him to do so. It is clear that his taste for the beauties of nature was never very keen; the time had not come when all people rave about natural scenery; he was in no way disposed to expose himself to English prejudice by betraying Scottish predilections, and I rather think that he was glad that the time of border raids had for ever passed away.

His father was a member of the Faculty of Advocates, but passed his life as a country gentleman. His mother was a daughter of Sir D. Falconer of Newton, who had been a lawyer in the times of the Stuarts, and had filled the office of president of the Court of Session from 1682 to 1685. So far as the youth was exposed to hereditary predilections, they were those of Scotch landlords, who ruled supreme in their own estates, of hard-headed Edinburgh lawyers, and of old families {114} opposed to the great Whig or covenanting struggle of the previous century. His father having died when the second son was yet an infant, the education of the children devolved on their mother, who is represented as training them with great care,-in what way or form in respect of religion we are not told.

David became an entrant of the class of William Scott, professor of Greek in the Edinburgh University, February 27, 1723, being still under twelve years of age. What his precise college course was is not recorded; but we know generally that in those times, and for many years after, boys who should have been at school, after getting an imperfect acquaintance with Latin and Greek, were introduced in the classes of logic, pneumatics, and moral philosophy, to subjects fitted only for men of mature powers and enlarged knowledge. I suspect there was no ruling mind among his teachers to sway him, and he was left to follow the bent of his own mind. Already he has a taste for literature, and a tendency to speculative philosophy. " I was seized very early," be says in " My Own Life," with a passion for literature, which has been the ruling passion of my life, and a great source of my enjoyments." In writing to a friend, July 4, 1727, he mentions having by him written papers which he will not make known till he has polished them, and these evidently contain the germs of a system of mental philosophy. " All the progress I have made is but drawing the outlines on loose bits of paper: here a hint of a passion; there a phenomenon in the mind accounted for; in

another an alteration of these accounts." Mr. Burton publishes part of a paper of his early years, being " An Historical Essay on Chivalry and Modern Honor." In it we have no appreciation of chivalry, but we have the germs of the historical, political, and ethical speculations which he afterwards developed. He inquires why courage is the principal virtue of barbarous nations, and why chastity is the point of honor with women (always a favorite topic with him), and is evidently in the direction of his utilitarian theory of virtue. About his seventeenth year he began, but speedily relinquished, the study of the law. " My studious disposition, my sobriety, and my industry, gave my family a notion that the law was a proper profession for me; but I found an unsurmountable aversion {115} to every thing but the pursuits of philosophy and general learning; and while they fancied I was poring upon Voet and Vinnius, Cicero and Virgil were the authors I was secretly devouring."

We have two admirable accounts of Hume's life: the one, " My Own Life," calm as philosophy itself; the other by Mr. Hill Burton, who had access to the papers collected by Baron Hume, and deposited with the Royal Society of Edinburgh; and who has collected all other available information, and put it together in a clear and systematic manner. But there is much that we should like to know not communicated. The autobiography, though honest enough, is not open or communicative. We may rest assured that in that great lake which spreads itself so calmly before us, there were depths, and movements in these depths, which have been kept from our view. Though so skilled in psychological analysis, he gives no account of the steps by which he was led to that deadly scepticism in philosophy and theology which be held by so firmly, and propounded so perseveringly. Mr. Burton has, however, published a remarkable document, which lets us see what we should never have learned from " My Own Life," that there had been an awful struggle and a crisis.

It is a letter written to a physician with great care, but possibly never sent. He begins with stating that he " had always a strong inclination to books and letters," and that, after fifteen years, he had been left to his own choice in reading: " I found it to incline almost equally to books of reasoning and philosophy, and to poetry and the polite authors. Every one who is acquainted either with the philosophers or critics, knows that there is nothing yet established in either of these sciences, and that they contain little more than endless disputes, even in the most fundamental articles. Upon examination of these, I found a certain boldness of temper growing in me, which was not inclined to submit to any authority on these subjects, but led me to seek out some new medium by which truth might be established. After much study and reflection on this, at last, when I was about eighteen years of age, there seemed to be opened up to me a new source of thought, which transported me beyond measure, and made me, with an ardor natural to young men, throw up every other pleasure or {116} business to apply actively to it. The law, which was the business I designed to follow, appeared nauseous to me; and I could think of no other way of pushing my fortune in the world but that of scholar and philosopher. I was infinitely happy in this course of life for some months, till at last,

about the be ginning of September, 1729, all my ardor seemed in a moment to be extinguished, and I could no longer raise my mind to that pitch which formerly gave me such excessive pleasure. I felt no uneasiness or want of spirits when I laid aside my book; and therefore never imagined there was any bodily distemper in the case, but that my coldness proceeded from a laziness of temper which must be overcome by redoubling my application. In this condition I remained for nine months, very uneasy to myself, but without growing any worse, which was a miracle. There was another particular which contributed more than any thing to waste my spirits, and bring on me this distemper, which was, that, having read many books of morality,-- such as Cicero, Seneca, and Plutarch, - and being smit with their beautiful representations of virtue and philosophy, I undertook the improvement of my temper and will, along with my reason and understanding. I was continually fortifying myself with reflections against death and poverty and shame and pain, and all the other calamities of life. These no doubt are exceeding useful when joined with an active life, because the occasion being presented, along with the reflection, works it into the soul, and makes it take a deep impression; but in solitude they serve to little other purpose than to waste the spirits, the force of the mind meeting with no resistance, but wasting itself in the air, like our arm when it misses the aim. This, however, I did not learn but by experience, and till I had already ruined my health, though I was not sensible of it." He then describes the symptoms: scurvy spots breaking out on his fingers the first winter, then a wateriness in the mouth. Next year, about May, 173 1, there grew upon him a ravenous appetite, and a palpitation of heart. In six weeks, from " being tall, lean, and rawboned, he became on a sudden the most sturdy robust, healthful-like fellow you have seen, with a ruddy complexion and a cheerful countenance." He goes on to say, that " having now time and leisure to cool my inflamed imagination, I began to consider seriously how I should proceed with my philosophical {117} studies. I found that the moral philosophy transmitted to us by antiquity labored under the same inconvenience that has been found in their natural philosophy, of being entirely hypothetical, and depending more upon invention than experience every one consulted his fancy in erecting schemes of virtue and happiness, without regarding human nature, upon which every moral conclusion must depend. This, therefore, I resolved to male my principal study, and the source from which I would derive every truth in criticism as well as morality." He tells how he had read most of the celebrated books in Latin, French, and English; how "within these three years I find I have scribbled many a quire of paper, in which there is nothing contained but my own inventions;" how he " had collected the rude materials for many volumes but he adds, " I had no hopes of delivering my opinions with such elegance and neatness as to draw to me the attention of the world, and I would rather live and die in obscurity than produce them maimed and imperfect." "It. is a weakness rather than lowness of spirits which troubles me;" and he traces an analogy between what he had passed through and recorded religious experiences. " I have noticed in the writings of the French mystics, and in those of our fanatics here, that when they give a history of the situation of their souls,

they mention a coldness and desertion of the spirit, which frequently returns." But, " however this may be, I have not come out of the cloud so well as they commonly tell us they have done, or rather began to despair of ever recovering. To keep myself from being melancholy on so dismal a prospect, my only security was in peevish reflections on the vanity of the world, and of all human glory, which, however just sentiments they may be esteemed, I have found can never be sincere, except in those who are possessed of them. Being sensible that all my philosophy would never make me contented in my present situation, I began to rouse up myself." He found these two things very bad for this distemper, study and idleness, and so he wishes to betake himself to active life. His choice was confined to two kinds of life, that of a travelling governor, and that of a merchant. The first not being fit for him he says he is now on his way to Bristol, to engage in business till he is able to "leave this distemper behind me." He says, that " all the physicians {118} I have consulted, though very able, could never enter into my distemper," and so he now applies to this eminent doctor.

In this remarkable document Hume unbosoms himself for the first time, and, I may add, for the last time. He had endeavored to act the self-righteous and self-sufficient stoic. We have other evidence of this. In the letter already extracted from, written when he was sixteen, he says. "I hate task-reading, and I diversify them at pleasure; sometimes a philosopher, sometimes a poet." "The philosopher's wise man and the poet's husbandman agree in peace of mind in a liberty and independence on fortune, and contempt of riches, power, and glory. Every thing is placid and quiet in both, nothing perturbed or in disorder." " A perfectly wise man that outbraves fortune is surely greater than the husbandman who slips by her; and indeed this pastoral and Saturnian happiness I have in a great measure come at just now. I live a king, pretty much by myself, neither full of action nor perturbation, -- <molles somnos>. This state, however, I can foresee, is not to be relied on. My peace of mind is not sufficiently confirmed by philosophy to withstand the blows of fortune. This greatness and elevation of soul is to be found only in study and contemplation; this can alone teach us to look down on human accidents. You must allow me to talk thus like a philosopher; 'tis a subject I think much on, and could talk all day long of." But the attempt had turned out a miserable failure, as he acknowledges in his letter to the physician. Doubts had crept in, and the stoic was tempted to turn sceptic. Writing long after to Sir Gilbert Elliott in regard to his " Dialogues on Natural Religion," which sap all religion, be mentions a manuscript, afterwards destroyed, which he had written before twenty. "It began with an anxious search after arguments to confirm the common opinion, doubts stole in, dissipated, returned, were again dissipated, returned again; and it was a perpetual struggle of a restless imagination against inclination, perhaps against reason."

The letter is supposed by Mr. Burton, on good grounds, to have been written to the celebrated Dr. Cheyne, author of the Philosophical Principles of Natural Religion" (1705),

and The English Malady; or a Treatise of Nervous Diseases of all kinds, Spleens, Vapours, Lowness of Spirits, Hypochondriacal {119} Distempers," &c. It is doubtful whether the letter ever reached Dr. Cheyne, and it may be doubted whether that eminent physician had in all his pharmacopoea a medicine to cure the malady of this remarkable youth. Dr. Cheyne defends with the common arguments the "great fundamental principles of all virtue and all morality: viz., the existence of a supreme and infinitely perfect Being; the freedom of the will, the immortality of the spirits of all intellectual beings, and the certainty of future rewards or punishments." But the youth who proposed to address him had already a system evolved which undermined all these. One could have wished that there had been a friend at hand to direct him away from Cicero, Seneca, and Plutarch, to a better teacher who is never mentioned. Not that we should have expected him in his then state to be drawn to the character of Jesus, but he might have found something in His work fitted to give peace and satisfaction to his distracted soul. But it is useless to speculate on these possibilities. All he says himself is: " In 1734 I went to Bristol with some recommendations to eminent merchants, but in a few months found that scene totally unsuitable to me. I went over to France, with a view of prosecuting my studies in a country retreat, and I there laid that plan of life which I have steadily and successfully pursued."[34]

We can easily picture the youth of twenty-three as he set out for France. By nature he is one of a class of persons to be found in all countries, but quite as frequently in Scotland as anywhere else, who are endowed with a powerful intellect, conjoined with a heavy animal temperament, and who, with no high aspirations, ideal, ethereal, or spiritual, have a tendency {120} to look with suspicion on all kinds of enthusiasm and highflown zeal. With an understanding keen and searching, he could not be contented with the appearances of things, and was ever bent on penetrating beneath the surface; and his native shrewdness, his hereditary predilections, and the reaction against the heats of the previous century, all combined to lead him to question common impressions and popular opinions. He saw the difficulties which beset philosophical and theological investigations, and was unable to deliver himself from them, being without the high sentiments which might have lifted him above the low philosophy of his own day in England and France, and the sophistries suggested by a restless intellect. He knew only the ancient Stoic philosophy in the pages of Roman authors, and the modern philosophy of Locke, as modified by such men as Shaftesbury and Hutcheson, and driven to its logical consequences by Berkeley: he bad tried the one in his practical conduct, and the other by his sifting intellect, and having found both wanting, he is prepared to abandon himself to scepticism, which is the miserable desert resorted to by those who despair of truth. Meanwhile his great intellectual powers find employment in constructing theories of the mind, in which he himself perhaps had no great faith, but which seemed the logical conclusion of the acknowledged philosophical principles of his time, and quite as plausible as any that had been devised by others, and brought such

fame to their authors.

With these predilections, France was the country which had most attractions to him, but was at the same time the most unfortunate country he could have gone to, and the middle of the eighteenth century the most unfortunate period for visiting it. In philosophy, the age had outgrown Descartes and Malebranche, Arnauld and Pascal, and the grave and earnest thinkers of the previous century, and was embracing the most superficial parts of Locke's philosophy, which had been introduced by Voltaire to the knowledge of Frenchmen, who turned it to a wretched sensationalism. In religion he saw around him, among the great mass of the people, a very corrupted and degenerate form of Christianity, while, among the educated classes, infidelity was privately cherished, and was ready to burst out. Voltaire had issued his first attack on Christianity, {121} in his " Epitre a Uranie," published in 1728, and the fire spread with a rapidity which showed that there were materials ready to catch it and propagate it. Sixty years later, one so fond of order and peace would have been scared by the effects produced by scepticism, so powerful in overthrowing old abuses, and so weak in constructing any thing new or better but at this time infidelity was full of hope, and promising an era of liberty and peace. The very section of the Catholic Church which retained the highest faith and the purest morality, had unfortunately been involved in a transaction which favored the sceptical tendency among shrewd minds. Only a few years before, the people believed that the sick were healed, and the blind made to see at the tomb of the famous Jansenist, the Abbe Paris; the noise made by the occurrences, and the discussions created by them, had not passed away when Hume arrived in Paris; and the youth pondered the event, to bring it out years after in his " Essay on Miracles." While he lived at La Fleche, a Jesuit plied him with some "nonsensical miracle," performed lately in their convent, and then and there occurred to him the famous argument which he afterwards published against miracles. " As my head was full of the topics of the `Treatise of Human Nature,' which I was at that time composing, the argument immediately occurred to me, and I thought it very much gravelled my companion; but at last he observed to me that it was impossible for that argument to have any validity, because it operated equally against the gospel as the Catholic miracles, which observation I thought fit to admit as a sufficient answer."

After living a short time in Paris, he retired to Rheims, and afterwards went to La Fleche, where he passed two of the three years he spent in France. We know nothing of his employments these years, except that he devoted himself most earnestly to the composition of his " Treatise on Human Nature." In 1737 he brought it over with him to London, where he published the two first books the end of the following year.

This treatise is by far the most important of all. his philosophical works. If we except certain speculations in history and political economy, it contains nearly all his favorite ideas. He devoted to it all the resources of his
